About a mile from the hotel is a small lake csiled Lake of the Woods, snd near this is

The "Observatory,"

At an altitude between 7,000 snd 8,000 feet. From this observatory the view is very extensive and wide, embrscing Sierrs vslley, with the towns of Sierra and Loyalton, the divide between Goose snd Honey lskes, Surprise valley, distsnt 164 miles, Pyrsmid lake, Humboldt desert, Reno, the Geiger grade, Mount Davidson, Wsshoe valley, etc. This point seems to be a sort of an electrical center for storms which come sweeping up the valley, ss the trees at one particular point are very much scarred by lightning.

Leaving Webber's, we took the road to Meadow lake and Fordyce valley, visiting st the lstter place the great reservoir snd

Dam of the South Yuba Canal Company.

The dam is sbont 600 fest long and 57 feet high, 190 feet base and at present 60 feet broad on top. It is the intention to continue it up until it is 30 feet higher, giving the lake an area of about 1,200 scres and sn average depth of about 75 to 80 feet. The dam is superbly huilt, every stone being carefully lsid, and it seems as possible to overturn the mountains themselves aa this dam.

From here we went to Meadow lake, another reservoir of this company, with s beautifully laid dam 800 or 900 feet in length.

Upon the shore of this lake is the

Town of Meadow Lake,

Formerly called Summit City. This town sprung up during sn excitement caused by the discovery of rich gold qnsrtz mines st this point, and in a short time hecame a flourishing city with a business in its streets so large that a traveler would often have to pick his way tbrough the crowd of teams as carefully as now in San Francisco. Three large, finely furnished hotels were built, and stone warehouses that would be a credit to any place; quartz mills were erected and completely furnished with the hest machinery, with steam or water power to drive them; sawmills furnished lumber for building and the mushroom town presented as thriving an appesrance as if it had existed a quarter of a century. But soon csme the discouraging discovery that the ores could not be worked to a profit. Failures and sheriff's seizures took place, and the town was deserted slmost as soon as it had grown. Hotels, houses and stores were abandoned with their furniture and fixtures intact; mills stopped; new mortars, stamps, shoes and stems, pans for smalgamating, gearing, pulleys and all the machinery necessary for first-class milla have heen absndoned and still lie there with the scale upon them as they left the foundry. Year by year the abandoned buildings are crushed by the weight of eaoh succeeding winter's snows, and gradually the town goes to ruin. A large stone warehouse which had been filled with furniture from the hotels und houses for security, had its iron doors forced last summer by some miscreant, and it was hurned, together with two hotels and all the buildings in one of the principal hlocks. At present there are only three families left of all the once populous town.

One man, Mr. H. H. Hartley, has always be lieved in the mines and has proved his helief by sticking to them through all the vicissitudes of 13 years. He has finally discovered a process by which he is ahle to work the ores profitahly on a small scale, and he helieves that with money enough to put up suitable machinery, the ores can be successfully worked. Should this ever take place, Meadow Lake may again become a flourishing town. Our road home from Mesdow Lake lay through forests of pine, tamarack, fir and cedar, crossing patches of snow occasionally, and passing the "English dam," which is 96 feet in hight. For a pleasant summer trip, a visit to the Sierras is more satisfactory than any we have yet taken. S.

Ward District.

Editors Press:—On September 1st the furnace of the Martin White company started up again on its second run. Arrsngements have been made to keep a steady supply of charcoal. Mr. Thomas, the superintendent, has proved himself to he a first-class smelter. Three shipments of fine bullion have been made, and the slag has never contained one per cent. of lead, hut much less. Extensive preparations are heing made to house large quantities of coal, ore, etc., for the severe winter anticipsted.

The suit between the Shark and Paymaster still drsgs its weary length, having been postponed till November.

The 20-stamp mill (lixiviation process) now being erected from designs of and under the direction of Csptsin Dahlgren progresses rapidly. The freight (mschinery snd huildings of the Troy mill) is expected every dsy. When this shall have been landed, 30 days will see the mill moving. The Psymsster still develops as well ss heretofore, snd an unusual amonnt of activity in erecting houses for the winter prevsils.

Still the csmp is overdone, and people should keep away, as one csn hire plenty of men at $3 per dsy, who are glad to get it.

The Paymaster South is still pegging away, but as yet does not show anything. The Juno company, recently incorporated in Ssn Francisco, is pegging awsy; results unknown.

The Defiance opens np splendidly, snd furnishes the carbonate ores for mixing with the ores of the Puymaster. Work will hegin shortly on the Bangor miniug company's claims. Next spring there will be msny locations prospected. "Fax."

Pacific Coast Railroad Items.

The track lsyers are at work on the Galt & Ione railroad, and have more than a third of the track laid now. They are lsying it at the rate of ahout half a mile a day and will have the joh completed by Octoher 15th, if not sooner.

Grading wss commenced on the 26th on the Portland, Dalles & Sslt Lske railroad, st Corrinne, Utsh. The work will he pushed ahead ss rspidly ss possible. Surveys sre heing made with satisfactory results, and Marsh vslley will be resched this week.

The highest trestle bridge on the Pacific cosst is the one in course of coustruction across Brown's canyon, two miles northwest of Freestone, in Sonoma county, on the line of the North Pacific Coast rsilroad. It will be 135 feet in hight from the bed of the oanyon, snd 600 feet in length.

A *Call* correspondent from San Jose ssys tbe long-promised narrow-gauge rsilroad is now completed from Dumbarton point to Alviso, where the construction train is huisy building culverts, etc., while the grsding forces are throwing up the road hed toward this place. Several hundred men are employed, and the grade is rspidly sdvancing in this direction, nearly two miles being ready for the track. The iron horse is expected here in less than 90 days. The main road will continue hence to Santa Cruz, via Los Gstos, snd s branch will run to San Jose almost parallel with the Southern Pacific, but the San Jose depot will he on the Alamaden, near Guadalupe creek. Flood & O'Brien are understood to be the owners of the road, and their immense timher tracts in the Santa Cruz mountains will he made available when the road is completed. There is no doubt that this enterprise will be profitable, as the resonces of the Southern Pscific railroad are heavily taxed transferring freight to San Francisco.

Heavy Mining Suits.—Six separate suits have been commenced in the District Court against the Santa Clara mining association of Baltimore, Maurice Dore, Ben. B. Thayer, *et als.*, known as the Guadalupe quicksilver mining company, all of wbich involve the land and hereditaments of the company, and prsy damages for the digging up and carrying away of minerals and ore, as mentioned in the separate complaints. A correspondent of the *Call* writing from San Jose says that three of the suits are commenced hy the Almaden quicksilver company, in the first of which they ask $1,000,000 damsges for the detention of the possession, and $1,000,000 for the ore extracted. The other two suits hy the same plaintiff involve large sums, and are based on similar grounds. A fourth suit has been commenced by the Sunol heirs for the possession of the property and $1,000,000 damages a year since the opening of the mine. Another suit against the same ssociation is brought by M. S. Jeffers for detention, damages, etc., the same aggregating $450,000. D. M. Delma, of this city, is attorney for plaintiffs.

Fish for the Sandwiches.—Commissioner Stone, from the U. S. Fishery at McCloud, has selected 20,000 salmon spawn for shipment to Honolulu. It has heretofore been supposed that the temperature of the inland streams of the Hawaiian islands was too warm to admit of the propagation of salmon. Careful observation, however, taken during many months past, shows a temperature in them about the same as in California during the summer, and it is believed the experiment about to be made will be a successful one.

Mining Decision.—The following is a late decision of the Department of the Interior: Philadelphia lode claimants, vs. Pride of the West claimants. Consideration of a mining location, alleged to be void for uncertainty. The end lines of a mining survey must he parallel courses, and distances must give way when in conflict with fixed objects.

In Peabody's model hnildings, London, the death rate is only 12 annually in 1,000, wbile the parish rate is 24½.

The Engineer.

How to Measure Flowing Water.

The measurement of flowing water has been the subject of protracted snd careful experiments under the auspices of both the French and English governments. We find in the "Transactions of the Royal Society of London" the following conclusions drawn from these experiments:

1. Thst the quantities, dischsrged in equal times, are as the areas orifices. 2. That the quantities, discharged in equal times under different hights, are to esch other nearly in the compound ratio of the areas of the apertures snd of the square roots of hights. The hights are measured from the centers of the apertures. The mean result, slso, of several experiments, all the openings being formed in hrass plates 1-20 of an inch thick, showed tbat for round, triangular and rectangulsr holes, the average of the numhers showing the proportion hetween theoretic discharge of water, calculsted as a falling body, and the actual discharge, aa messured, was 6.1 and, for rectangular holes, it was 6. It has also been found that the effeot of gruvity may be represented by 64 feet 4 inches, or 64.3—that is, the hight in feet through which the hody falls being multiplied hy 64.3 will give the square of its velocity in feet per second. For the actual discharge per second in cubic feet, multiply the product of the altitude or head of water in feet, and tbe area of the orifice in square feet, snd the time in seconds, hy 64 3, then extract the square root, snd multiply hy 6. It is found, also, that with small orifices the effect of a high head is to contract the vein and to diminish the discharge, so that the nearer the orifice can be brought to the surface, and yet the water be kept running with a full stresm and without causing any eddy or depression of the surface, the greater will he the discharge. But, with larger apertures, as for instance one with 3 1-4 feet in length by 1 5-8 feet in width or ahout 5 3-8 square feet of area, the dischsrge incresses with the increase of head.

As to the discharge of wsler from notches in dams, it is found to be equal to two-thirds of the dischsrge from an orifice of the same size with a full stream under the same head. The proportion between the theoretic and the actual discharge from opsn notches varies with the depths, the factors heing used less with the greater depths. An English hand-book of tables gives 214 cubic feet per minute as the quantity which would run over every foot in width of a regular notch, one foot in depth from the water's surfsce. The amount discharged depends very much on the form of the notch or aperture. A plain, rectsngular notch, cut with square edges in a three-inch plank, will discharge very much less than one which has its inner edges beveled or rounded off in the parbolio form of the contracted stream or vein of water. If the aperture he small the difference may amount to a fourth of the whole quantity. Care should also be taken to form the wing-walls to sluices with curved or trumpet-shaped approaches, conformed to the natural contraction which may be produced hy the overflow or sluice-way.

To Obtain the Quantity

Which passes through a parallel channel in a given time, the sectional areas should he multiplied by the mesn velocity, the latter element heing obtained by adding the velocity of the water at the surface and that at the hottom of the current and dividing the sum by two. As it may not be convenient, in every case, to ascertain the velocity at the bottom, the mean velocity may be determined with accuracy sufficient for practical purposes, by ascertaining the surface velocity in inches per seoond in the middle of the stream, and the mean velocity will he equal to this velocity less the square root of this velocity minus five. If, for example, the surface velocity in the stream is equal to 36 inches per second—the mean velocity will he found hy subtracting 5 from 36, leaving 31, then extracting the square root of 31, which is 5.5, and subtracting this last figure from 36, giving 30.5 inches per second for the mean velocity. Multiplying this number by 60 and dividing by 12, or, which is the same thing, multiplying it hy 5, will give the velocity in feet per minute. In the case, just supposed, the velocity per minute will he 152 5 feet. If, then, the water course he 4 feet wide and 2 feet deep, the amount of water discharged per minute would be 152.5x8 or 1,220 cubic feet.

When the overfall is a thin plate, it will discharge a greater proportionate quantity when the stresm is only one inch deep than with greater depths. When the overfall is of two-inch plank, the flow of water is more retarded, a greater head is requisite, and the maximum discharge is given by a head of seven inches. When the length of the overflow plank is ten feet, the co-efficient is greatest with a depth of five inches, and when wingboards are added, causing the stream to converge toward the overfall at an angle of 64 degrees, the coefficient is greater even when the head is less, showing the utility of proper wingwalls ou sluices.

To determine the

Hight of the Waterfall

In a running stresm, a small temporary dam, unless one exists, must be made so as to secure a still surface. Take two poles, sufficiently long to reach from the bottom of the water to

the required line level. Make a plain mark or notch on both aticks, at a distance from the upper ends equal to the distance of the intended line level above the water, marking that distance in feet and inches. Push the poles dnwn through the water into the earth at the bottom nntil the notches aro both at the level snrface of the water, care being taken to have the poles plumb and at a convenient distance apart. Sight aoross the tops of these two, and sot as many more as may be desired to ran the line of level to the desired point, and the tops, being ranged accnrately hy the first two, will show a water level ao many feet above that of the water. It is estimated that this is a more accurate way than the use of the ordinary apirit level.

American Inventions Aiding English Engineering.

The English correspondent of the *American Manufacturer* says: My engineering readers well know that there is a bit nf railway line in this country which is really the pioneer of the two-foot gnage eo far as this country is concerned. It is that bit of line which rnus from those mountains in Caernarvonshire, where, at Festniog, the splendid slates are qnarried which find their way to the rest of the world via a small port, a few miles from the quarries, known as Portmadoo. So stsep is the gradient that, in returning from the qnarries to the port, the engines are wanted only to act as brakes. With suoh faoilities it is possible to convey immense quantities nf slates even upon so tiny a road. So considerable has, however, been the progress in recent times in England, and so excellent are still the prospects in this direction, that the bnilders find it difficult to get all the slates they want with promptitude, and for those they get they have to pay enormous prices. Hence the London & North Western railway company have determined to make a line of some 12¼ miles in length, mainly to distribute the slates of the Festiniog qnarries by railway over most of the kingdom. Thia 12¼-mile line they are now making from Festiniog to that beautiful little spot in North Wales, known to nearly all American tourists in Europe as Bettwseyooed. In the doing of this work they have to drive a tnnnel twn and a half miles. The work is varied and difficult, but the engineers are going ahead well, becanse they have had sense enough to select good tools. These tools have been wholly provided for them by American inventora. All the work is being done by the Burleigh, the McKean and the Ingersoll drills. These all, as you know, are American inventions. The first is being fed by hand power and the latter by Fowler's air compressors. So splendid is the work these engines are doing that the tunnel is being made a place for visits of eagineers' associations who desire to keep themselves abreast of the smartest thing in their line now doing.

The Hudson River Tunnel.

Active preparationa are now in progress for the construction of the Hudson river tunnel on the Jersey shore. The entrsnce to the tunnel is located on Jersey avenue, near Fifteenth street, and the excavation will be carried in a northeasterly direction, terminating in Washington sqnare, New York. The tunnel will be two miles in length, and it is calcnlated the cars will pass through it in three minutes. The road-bed will be 23 feet in width. The shaft at the foot of Fifteenth street, Jersey City, is 100 feet in circnmference, and the brick wall is three feet and four inches thick. The shaft has been sunk to the depth of 20 feet, and will be further excavated to the depth of 62 feet, when the excavation beneath the river will he commenced. The machinery for the work is now in position, and the excavation of the shaft is nearly completed. The eastern grade of the tunnel is twn in a hundred feet, descending from Jersey City, then ascending on the New York side two in a hundred feet.

Aa soon as the shaft ia sunk to the required depth, a few feet will be excavated in the tunnel, when an iron cylinder with hinged doors will be inserted so that the laborers can proceed with the work. Compressed air will be forced from the surface into the cavity. Very little blast will be necessary, tbe first vein of rock being 1,100 feet from the New York side, and the rook is soft. The depth of earth over the masonry will not be less in any part than 35 feet, so that no injury can occur from the anohorage of vessels. The cost of this stupendous enterprise will be $15,000,000, of which $10,000,000 has been already subscribed.

A Monolithio Aqueduct.—The aqueduct from La Vanne to Paris, 135 milss long, is nearly entirely of *beton coignet*, or artificial atone. The Fontainebleau aection of 37 milea, over dry quicksand, is composed of a seriea of arches, some of them 50 feet high. Eight or ten bridges, of span from 75 to 90 feet, are also of *beton*. The composition for foundation and gravel walls ia: aand, 2½; gravel, 2½; hydraulic lime, 1; Portland cement, one-quarter. For pillara, abutmenta, etc.: sand, 4; hydraulic lime, 1. The other portiona, sand, 4; hydraulic lime, 1; Portland cement, one-quarter to one-half.

The Seaboard Oil Pipe Line.—Active operations in connection with thia enterpriae have been ateadily continued. On Angust 31st a party engaged in surveying the ronte arrived at Colnmbia, Pa., in the prosecution of their labors, and continued the survey toward Lancaster, Pa.

Useful Information.

Calculating the Power of Belting.

A writer in the *Textile Manufacturer* gives tbe following, which will interest mechanics: As the pnwer of a steam engine is expressed in three different ways—nominal, indicated and actnal—so the ability for a belt to transmit power may be expressed in three corresponding methods. We may denote, first, the poasible power; that is, the power which it is possible for the belt to transmit nnder the very bsst conditions. The power which it is possible for a belt to transmit is simply on the strength of the belt and the peripheral velocity of the driving pulley. In taking power from any source of motion, these are the two points which control us; all the others we can control and modify to a certain extent. Moreover, we can determine these data with a considerable approach to accnrscy; while all the others demand very difficult and carefal special experiment. Seeing, then, that ordinary belts will, as we have stated in a previous article, sustain safely a working tension of 45 pounds per inch in width, the rnle to determine the width of belt and size of pulley required to transmit a given horse-power is easily found. Since a horse-power is 33,000 pounds raised one foot high per minute, we mnst adjust the width and velocity of belt an as to effect the required result. Thus, if the belt moves with a velocity of 733 feet per miaute, a belt five inches wide will transmit five-horse power, provided the effective tension is 45 pounds per inch. If the velocity be increased to 1,466 feet per minute, the same bslt, with the same tension, will transmit ten-horse power. So that a five-inch belt, applied to a pnlley four feet in diameter, makiug 120 revolntions per minnte, wonld transmit ten-horse power when the effective tension is 225 pounds. We say effective tension, meaning thereby the tension actually applied to produce the revolution of the receiving pulley.

A belt may be subjected to great tension, and yet a very little of this tension may be applied to the transmission of power. But this circumstance can only arise when very little resistance is offered by the receiving pulley. If the latter offers an adequate resistance, the power will be transmitted. Consequently, the rnle that we have indicated corresponds to the rule for determining the nominal horse-power of a steam engine; the engine may work up to the power assigned to it, and indeed may in general far exceed this power; just as the belt may transmit the power for which it is calculated, though there is no certainty that it does so. By taking tbe actual effective tension of the belt, and multiplying it by the actual velocity, we get what may be oalled the indicated power of the belt, which corresponds to the indicated power of the steam engine. And, finally, by measuring the actual power transmitted—which may be done by means of a dynamometer—we can get the actual power transmitted. Rules based upon the amount of belt surfaced in contact with the pulley, and on similar data, cannot be made to give reliable results. For practical purposes velocity and power to resist tension are the only available elements of the calculation. Actual tension, adhesion, friction, etc., can all be varied at will, and consequently form no certain dependence for the calculations of the machinist and engineer.

Home-Made Colonists.—A novel feature in technical education consists in the special training of intending colonists which is being introdnced into certain educational establishments. At the Crystal Palace school of practical engineering, for instance, there is a colonial department devoted to the manufacture, if we may be allowed the word, of explorers and settlers. The conrse of instruction, which is as far as possible practical in its details, includes everything in the shape of scientific and mechanical expedients which a man thrown entirely on his own resources wonld be likely to find useful. Among the subjects tanght, for instance, are the damming of streams, the making of reservoirs, filter-beds, water wheels, pumps, wells and windmills, sanitary arrangements, rope-making, modes of clearing, the felling, barking and seasoning of timber, the prinoiple and construction of worka in timber, rough oarpentry, joining, fencing, cart-wheel making, glazing, roofing, painting, brick and tile making, the getting and working of stone, the preparation of mortar, cements, and concretes, road-making, tent-making, temporary shelters, and "shifts and expedients of camp life." With educational facilities such as these, the future race of coloaists should be able to compass great things.—*British Trade Journal.*

Bending Wrought-iron Tubing.—Ziegler, in the *Maschinen Constructeur*, recommends tubes, up to 20 centimetera diameter, to be chalked in the part which it is desired to bend, and laid on a fire with a small blast, on the part opposite to the curve which it is desired to make. The lower part of the tube only is to be heated; if the fire ia insufficient to heat the whole length, the tube must be paased backwards and forwarda till enough ia heated. The tube is then placed in a cloae-fitting hole up to near the warmed surface, and then carefully twisted around, not backwards. As the tube crushes, the bending is atopped, and operations begun again. The walls on both aides of the tnbe being at first of equal length, but the outer side getting longer during the bending, an equal heating wonld lead to buckling. Frequent heating is tn be avoided.

What is Steel?

The *American Manufacturer* says that it will give its readers the decision in full, as soon as rendered, oancerning the harassing qnestion, What is steel?

Whether it be cast, malleable or homogeneons material of definite physical strncture.

Whether it be malleable iron with sufficient carbon to temper.

Whether the whole iron family shonld be classified in the three divisions: (1) Containing bnt little carbon and not tempering. (2) Containing enough carbon to temper. (3) Containing much carbon and not malleable.

Whether it be homogeneous iron which mnst be specified as being "ten-carbon homogeneons irnn" up to "fifty-carbon homogeneous iron."

Whether it be iron cast direct from a state of fnsion into an ingot.

Whether it be iron of certain molecular condition rather than of atomio charaoteristics.

Whether it be iron defining itself by definite mechanical strncture, more than by its chemical elements.

Whether there bs distinct species of steel produced by tho separate processes, prohibiting a positive general line that would be applicable to all, on account of the differing chemical proportions of eaob.

Until a decision is arrived at, we must urge our readers to cling to the opinion and maintaiu it with religious zeal, tbat steel is steel.

Silicated Carbon Filters. — Professor Wanklyn has, it would appear, been conducting a series of exhaustive experiments, which have, off and on, extended over some years, with the object of ascertaining the peculiar action of "silicated oarbon" as a filtering medium. The results of his investigations we find detailed in a paper on filtration lately read by him at the Sheffield meeting of the British medical association. The one broad fact arrived at is that silicated carbon possesses in a high degree the property of decomposing nitrogenous and organic matters, and this though they be contained in very dilnte or comparatively strong solutions. Water containiag nitrogenous matter, animal secretions and excreta, as milk and urine greatly diluted, with solutions of quinine, morphia and stryohnine, were, among other liquids, made to pass through the filtering material and with striking results. In the case of the quinine and strychnine experiments eight and one-fourth aud eight and three-fourths grains respectively of these intensely bitter alkaloids were dissolved each in one gallon of water, and after filtration of the solutions they were found to be devoid of bitterness, a striking proof of the thorough decomposing or eliminating action of the material. The careful investigations of Professor Wanklyn establish the reputation of the silicated carbon filters on a yet surer basis, and point to their complete trustworthiness among much that is untrustworthy in the way of filters.

What is an Ingrain Carpet.—The two-ply ingrain known to the trade is a fabric composed of two webs or plies of cloth made with different colored yarns—say one ply green, the other red—of equal consistence or texture, united at the edges of selvages of each by the selvage threads, and ingrained or united at different parts of the cloth, wherever called for by the desiga or pattern. If the red ply represents the ground color of the design, then the green will be the figure color; and whenever the green figuring ply appears over the red ground ply, that is ingraining. The more general this ingraining or mixing up of the two webs or plies, the better the fabric is ingrained and the longer it will wear. The three-ply ingrain is made and iagrained after the same manner. A two-ply carpet, woven on the same loom and "mounted" in the same manner as a two-ply ingrain, if woven plain, without any design or pattern, would be a seamless bag, or two bags joined together by one side of each.

Good Health.

Method of Restoring Suffocated Persons.

A new instrnment for the purpose of resuscitating asphyxiated persons, and particularly those who have been in danger of death by drowning, has been invented by a French doctor, M. Woillez, and may be applied to similar uses in other casea of a like nature. The *Colliery Guardian* gives the following description: It is called the "spirophore," and consists of a sheet iron cylinder, large enough to receive the body nf an adult person. This cylinder ia closed at one end, and the body of the person to be operated upon is inserted, feet foremost, at the open end, up to the neck, round which a diaphragm ia placed in such a manner as to prevent air from entering the cylinder. An air pump is then set to work; the air is drawn off from the cylinder, with the resnlt of causing a partial vacunm, when the outer air by its weight forces itself into the lnngs through the mouth and nostrils, which are exposed to the external air; by an opposite action of the pump the air is allowed to re-enter the cylinder, and respiration is thereby imitated. A glasa plate inserted in the cylinder enablea the operator to watch the movements of the chest, which rises and falls, as in life, with the alternate working of the pump; these may be repeated abont 18 timea a minute, and an exact imitation of natural breathing is thereby effected. The maohine promiaes to supersede what is known as the "Silvester" method of resuscitating the apparently drowned, from the nsme nf its inventnr, a London surgeon. This is the mnde adopted by the Royal humane society, and consists of causing respiratory movements of the walls nf the chest by alternate raising and lowering of the arms of tbe patient as he lies on his back. In this method the lungs are nnly partially filled at eaob moment, while by means of the "spirophore" twice as much air enters the lungs at eaoh inspiration as in ordinary breathing, and more than 100 liters of air may be passed through the lungs of the patient in ten minntes, while a healthy person wnnld not breathe more than half that amount. There is no fear of rupturing the lungs, as no force is used in the ingress of the air beyond that exerted by its own weight, in endeavoring to overcome the vacunm created by the exhaustion of the air from tbe interior of the cylinder.

Antidotes for Poisons.

Mothers and nurses not unfreqnently give those under their charge poisonons doses of acids, laudanum, etc., or administer them in haste, in mistake; or children, ever restless, prying into cupboards, and finding some bottles or vials, have, ont of curiosity, hastily swallowed landannm, the mineral acids and the like, whilst younger children have been known, again and again, to get hold nf saucers placed on floors and windows, containing a solution of cobalt, "fly-stone," or fly-paper.

Opium is the most common poisonous agent, taken or administered in the form of laudanum, Bateman's drops, Elixir paregoric, Godfrey's cordial, and, I fear, some soothiag syrups, as well as most diarrhea and cholera mixtures. Any of these articles, administered to young children with unsparing hand, are liable to produce the dull, heavy stupor of opium poisoning. When the qnantity taken is snpposed to be sufficiently large to produce death, the first and great object is to remove the poison from the stomach by an active emetio dose; and the most convenient and safest for a mother to give, is finely ground mustard, suspended in warm water. This, or ipecac, may he given freely, till copious vomiting is excited.

The patient must be kept constantly roused and in motion, by walking; cold water being occasionally dashed over his head and face. After vomiting has been effected, strong ooffee and aqua ammonia may be administered with good results.

When sulphuric acid, or oil of vitriol, nitric acid, or aquafortis, and oxalic acid, have been swallowed, or poisonous aoids of any kind, the mother should administer as speedily as possible, an alkali to neutralize it, such as chalk, baking soda, lime-water, magnesia, saleratus nr strong soap-suds. For prussio aoid give dilute ammonia, and resort to the cold donche and electricity. If there should be any delay in getting any of these antidotes ready, mustard and warm water may be given with dilntents till vomiting occurs.

If arsenio or any of its preparations has been unwarily taken, magnesia or charcoal may be administered freely, stirrsd in milk, which will hold or arrest poisonous action, at least till the physician arrives with hydrated protoxide of iron, stomach-pump, etc.; though there is ample evideace in medical records to prove that patients have been saved by the free use of charcoal, suspended in milk; so also has an infusion of tobacco given freely, been successful, in those unused to the noxions weed. One of these agents are almost always at hand in every household, and hence no serions alarm need be manifested in slight accidents of this kind.

As mothers are apt to have in the house solutions of corrosive sublimate, or "bng-poison," children may tamper with the bottle; and, in such cases, prompt action is salvation to the child. She must not wait to summon a physician, but give immediately the whites of eggs, beaten up in water, without measure. The gluten of wheat flour is also useful, which can readily be employed by throwing a handful of flour into two or three pints of water, and administer it as fast as possible.

Poisoning in families by other agents are so rare that it is unnecessary to mention them. To recapitnlate: In all cases where poisonous substances have been taken into the stomach, the first step is to cause their ejection by vomiting, by simple means, if possible, or by neutralizing thom by the proper antidotes. —*Peterson's Magazine.*

Be Agreeable at Meals.—You tell us to make ourselves agreeable and entertaining daring our meals. Some of us have not the faculty of ready speech. What'a to be done in such a case? Ans.—Every one oan do something to add to the aocial life at the table. If one cannot talk, he can listen or ask questions, and draw out othera who can talk. Good listenera are aa necessary as good talkers. Never argue at the table; bnt tell plessant atories, relate or read anecdotes and look out for the good of all. Sometimea a single anecdote from a paper starts a conversation that lasts during the meal time. A family table ought to be bright and cheerful, a sort of domestic altar, before which every one casts down his or her offering, great or small, of pleasantness and peace; where, for at least a brief space in the day, all annoyancea are laid aside, all stormy tempera hnshed, all quarrels healed; every one being glad and content to sit down at the same board and eat the aame bread and salt, making it, whether it were a rich repast or a dinner of herbs, equally a joyfnl, almost a sacramental meal.—*Dr. Holbrook.*

MINING AND SCIENTIFIC PRESS.

W. B. EWER.....SENIOR EDITOR.

DEWEY & CO., Publishers.

A. T. DEWEY, GEO. H. STRONG
W. B. EWER, JNO. L. BOONE

Office, No. 224 Sansome St., S. E. Corner of California St., San Francisco.

Subscription and Advertising Rates:

ADVERTISING RATES.—1 week.	1 month.	3 mos.	12 mos.
Per line.....	.25	.80	$2.00	$5.00
Half inch (1 square)...	$1.00	3.00	7.50	24.00
One inch.....	1.50	4.00	12.00	40.00

Four weeks are rated a month.

Large advertisements at favorable rates. Special or reading notices, legal advertisements, notices appearing in extraordinary type or in particular parts of the paper inserted at special rates.

SUBSCRIPTIONS payable in advance—For one year, $4; six months, $2.25; three months, $1.25. Remittances by Registered letters or P. O. orders at our risk

SAMPLE COPIES.—Occasionally we send copies of this paper to persons who we believe would be benefited by subscribing for it, or willing to assist us in extending its circulation. We call the attention of such to our prospectus and terms of subscription.

THE ORIGINAL ARTICLES in this paper are mostly set in solid type, giving in our columns one-third more reading than is contained in ordinary leaded matter.

ADDRESS all letters to the firm, and not to individual members, or others, who may at any time be absent from our office.

Our latest forms go to press on Thursday evening.

San Francisco:
Saturday Morning, Oct. 7, 1876.

TABLE OF CONTENTS.

GENERAL EDITORIALS.—What a Patent Agent Ought to Be; Gems and Precious Stones; Mechanical Ore Concentration and Separation, 233. Micro-Lithology; Reopening Mines in California; Remarks on Quicksilver, 240. Death of James Lick; Patents and Inventions; Notices of Recent Patents; California at the Centennial, 244.

ILLUSTRATIONS.—Mechanical Ore Concentration and Separation, 233. The Late James Lick, 241.

CORRESPONDENCE.—Some of the Mines of Nye County; In the Mountains, 234-8. Ward District, 238.

MECHANICAL PROGRESS.—The Care of Machinery; Wave Power; Pneumatic Railway; Ship Safe; Liquid Indicator; Metallic Railway Cars; Monster Machines; An Improvement Needed in Sleeping Cars; Leasing Farm Machinery, 235.

SCIENTIFIC PROGRESS.—A Chance for Applied Science; Physiological Effect on Condensed Air; Lightning Rods; Science Teaching in Aberdeen; Notes on Blowpipe Analysis; Experiments with Preserving Wood; On the Geological Age of Veins of Mercury, 235.

MINING STOCK MARKET.—Sales at the San Francisco, Pacific and California Stock Boards; Notices of Assessments; Meetings and Dividends; Review of the Stock Market for the Week, 236.

MINING SUMMARY from various counties in California, Nevada, Idaho, Montana and Wyoming, 237-38-44.

THE ENGINEER.—How to Measure Flowing Water; American Inventions Aiding English Engineering; The Hudson River Tunnel; A Monolithic Aqueduct; The Seaboard Oil Pipe Line, 239.

USEFUL INFORMATION.—Calculating the Power of Belting; Home-Made Colonists; Bending Wrought-iron Tubing; What is Steel; Silicated Carbon Filters; What is an Ingrain Carpet, 239.

GOOD HEALTH.—Method of Restoring Suffocated Persons; Antidotes for Poisons; Be Agreeable at Meals, 239.

MISCELLANEOUS ARTICLES.—Pacific Coast Railroad Items; Heavy Mining Suits; Fish for the Sandwiches; Mining Decision, 238.

NEW ADVERTISEMENTS.

Paul's Dry Process, S. F.; Cincinnati Gold and Silver Mining Co.—Sale; Sierra Iron Co.—Sale; Eagle Quicksilver Mining Co.—Assessment.

BULLION SHIPMENTS.—Since our last report the following bullion shipments have been made: Northern Belle, Oct. 1st, $14,956; Arizona, Oct 1st, $3,681; Consolidated Virginia, Sept. 26th, $152,433; New Coso, Sept. 25th, $2,000; Leopard, Sept. 24th, $7,685; Consolidated Virginia, Sept. 27th, $840 741; California, same date, $20,637; Ophir, Sept. 28th, $12,875; Rye Patch, Sept. 27th, $3,100; Humboldt, September, $1,471; New Coso, Sept. 27th, $4,500, Sept. 29th, $2,400; Con. Imperial, Sept. 28th, $5,934; Tybo Con., Sept. 26th, $12,771; Comanche, Sept. 26th, $7,901; Consolidated Virginia, Sept. 30th, $154,460; California, Sept. 30th, $122,381; Manhattan, Sept. 29th, $13,806; Calaveras, Oct. 2d, $3,100; Ophir, Sept. 30th, $59,751; New Coso, Oct. 1st, $2,500.

JACOB HUNTSINGER, late president of the Miners' Trust bank, at Pottsville, Pennsylvania, was re arrested on five distinct charges, covering alleged embezzlements to the extent of $200,000. He was sent to prison in default of $238,000 bail.

THE large sum of $19,058,250 in silver coin has been paid out by the Treasury Department in Washington for the redemption of fractional currency since April 19th. A balance of $2,000,000 in such coin is still left.

IT is stated that Don Carlos informed the French government that he would not re-enter Spain at the cost of another civil war, and will quit Paris for Belgium or Switzerland in a few weeks.

ON FILE.—Lixiviation of Silver Ores; Tybo District and its Mines; Comstock Papers, No. 7; Alpine County Mines.

Micro-Lithology.

In a country like this, where riches are a title to high esteem and power, any new branch of science that has no direct influence upon money making is likely to be held in low estimation. Although micro-lithology may be said to rank amongst some of the newest branches of science, yet if we are to judge of it by the short paper on this subject read at the last meeting of the San Francisco microscopical society, which we append, it appears to us to have an eminently practical tendency (we mean money making) which ought to render it attractive, even to those who are not scientists.

Surely it is of importance, particularly to the Comstock miners, to acquire some sort of knowledge of the rocks amongst which they are daily working, and a way by which the structure and individual mineral particles can be readily distinguished or read like the letters in a book (such being micro-lithology) ought, we should think, to be sufficient to provoke a desire to acquire that knowledge. Some of the rock sections, when viewed under the microscope, present a most beautiful appearance, and it is difficult to believe that they are only portions of what appeared to the unassisted eye to be a dirty opaque rock.

Very little in English has been published on this subject, though all our leading geologists are, we understand, hard at work upon it, and no collection, particularly of what are called eruptive rocks, is now considered complete unless each specimen is represented by a slide, with the section of the rock mounted upon it. The thickness to which the sections are required to be reduced is, of course, entirely dependent upon the transparency of the rock constituents, and is commonly from one-hundredth to one-thousandth of an inch.

It is impossible to do justice to the subject without more space, so that we will try and acquire all the information we can, and give to our readers in a condensed form in another issue, but in the meantime we desire to call it to the attention of our numerous readers, some of whom are and have been conducting trials of mining ground on which have been expended millions of dollars and years of time. It is reasonable to suppose that without such knowledge as we refer to, great mistakes must have been made and no end of money and time wasted, which might have been saved had they been able to distinguish the rocks which formed the boundary of the different metaliferous deposits.

The following is the paper referred to above, which was read by Mr. Melville Attwood at meeting of the San Francisco microscopical society:

The slides marked Nos. 1, 2 and 3, are sections of rock from what, at the Gold Hill portion of the Comstock, is known as the black dyke. The specimens from which they are cut were taken from the dyke at different depths below the surface, at 1,100, 1,400 and 1,740 feet. I have made a careful examination of them, and think they are from a basaltic rock, belonging to the class called dolerites, in conformation of which these sections will be seen to consist of crystals of labradorite and augite, imbedded in a grayish paste or matrix, in which are also numerous minute particles of magnetic iron—presenting that mottled appearance so characteristic of that class of volcanic rocks. The matrix is a compound of the same ingredients Specific gravity, 2.7; contains silica, 50 per cent.

Slide No. 4 is a section of dolerite and anamesite, from Bolvershahn, in Siebengebirge. It resembles the black dyke so much that I can hardly distinguish any difference between them.

This black dyke, except in some places where it is separarated from the fissure by small masses of diorite and an altered trachytic greenstone, may be said to form the *foot-wall*, or western boundary, of the greater portion of the Comstock lode—though the term lode can hardly be applied to the Comstock, as, according to the generally accepted meaning of that word, "a true lode" should have well-defined foot and hanging walls. Now, in the case of the Comstock there is no well-defined hanging wall. Indeed the indistinct character of the eastern boundary renders the determination of the width of the main fissure a difficult matter.

The main fissure, with the dyke for a foot-wall, dips easterly at an angle varying from 45 to 55 degrees to a depth of upward of 1,000 feet; but the inclination after that appears to gradually diminish, and in some of the lower workings it is said to be less than 35 degrees.

The main fissure does not carry much ore. The bonanzas or rich ore bodies are found in separate fissures, which branch off and rise nearly vertically from the foot-wall. They are from 200 to many hundred feet apart.

The old plans (cross-sections) of the Ophir, Mexican, Savage, etc., show that these branch fissures rise in a waving line to the surface, giving that Y-like appearance to the workings at the croppings. They do not in their course, however, follow the irregularities of the foot-wall, so that at different points they run into it again. As depth is attained they do not reach the surface, but only rise to a limited hight above the foot-wall, rendering cross-cutting from it the best and safest trial to make for proving the value of the ground. The rock occupying the space between these fissures is an altered trachytic greenstone, but as the difference between it and the unaltered overlaying rock is not easily recognized by the naked eye, the importance of a microscopic examination of these rocks, as the trial of cross-cutting progresses, cannot be over-estimated. I need not add that to cross-cut in the unaltered rock would be a fearful waste of time and money. From all appearances these branch fissures may continue to be met with at much greater depths than even the most sanguine have been led to suppose.

Argentiferous gold has lately been found mixed with the silver ore in some of the deepest workings (2,000 feet) in fully as large a proportion as when the mines were only a few hundred feet deep.

Slides Nos. 5 and 6 are sections from the unaltered trachytic greenstone. Specific gravity, 2.7; contains silica, 52 per cent.

Slides Nos. 7 and 8 are sections of the altered trachytic greenstone; specific gravity, 2.658; contains silica, 62 per cent. The green mineral so conspicuous in these altered rocks is smaragdite. Slides Nos. 9 and 10 are sections from what may be called "True Horse," found in the ore bodies. Specific gravity, 2.5; contains silica, 85 per cent.

I have often felt greatly humiliated when asked the name of the rock in some of the Comstock mines which I was examining, and, like many others, had to cover my ignorance by telling them that it was "porphyry."

Slides Nos. 11 and 12 are sections from the Comstock ore, showing how the argentiferous gold is mechanically mixed with the silver ore.

Slides Nos. 13 and 14 are sections cut from rock taken from different points on Mt. Davidson and sent to me as specimens of the Mt. Davidson syenite. On examination it will be seen that the feldspar is not *orthoclase*, so that it is a diorite, instead of a syenite. I will try and procure some more specimens and submit them to the society at some future meeting.

I am greatly indebted to my friend Mr. Hanks for having kindly assisted me in determining the amount of silica in the different specimens, and also for helping me in taking the specific gravity of them.

Re-opening Mines in California.

We are glad to notice in our interior exchanges that in a great many instances work is being resumed on many mines in this State which have been abandoned in times gone by. There are, without doubt, thousands of mines now lying idle in California which could be made to pay if properly worked. Mines were abandoned 10 or 12 years ago which will pay now when managed in the right way. In those days we were comparatively ignorant of quartz mining, or rather of quartz milling, and many meritorious enterprises were abandoned which failed from ignorance, extravagance or careless ness of their managers.

The prevailing impression used to be that all a man had to do was to find a mine and it would make him rich. Then people began to think after a few years that he must find a *good* mine and it would make him rich. In these days finding the mine is the least part of the battle. There are plenty of mines, but not so plenty are those which make men rich. There is more in the exercise of prudence, judgment and economy in making a mine pay than in getting the mine. Of course, every ledge found will not pay, but many of them will that do not now, if the owners go to work in the right way.

Economy and the exercise of common sense in mining are, we are sorry to say, not practiced as often as they should be. It is absurd for a man to select half-a-dozen specimens of the best ore, have it assayed, and base all his calculations of profit on that assay. It is equally absurd for him to go into extravagant machinery and reduction works before he finds out something definite about the mine. Why cannot a company of from five to ten men go to work at a mine like an equal number would go to work on a ranch, and all of them pitch in and work, and at the same time make every cent tell? But, unfortunately, people imagine when they get hold of a mine that it must pay, whether or no, and they will run into all sorts of useless debt and trust to the mine to bring them out. As a general thing it is as hard for a mine to get out of debt as for an individual; in fact, it is harder for the mine than the individual, as it is not its own master.

The mining and metallurgical experience gained by our miners since the days of Washoe, Reese River, White Pine, Pioche and others, has been of great benefit. Mines were opened in California before those camps were known, which were abandoned for silver mines in Nevada, and which have since laid idle. Now, however, come men with more experience than the miners of 1855 and 1860 had in quartz. They are going about California, occasionally starting up a mine which they knew in early days and which they think will pay now with increased knowledge and experience.

It is a good thing for California and the mining interests at large that these mines are being re-opened. They furnish employment to miners and help sustain the smaller interior towns. Those which are successful are examples to incite others to take hold also. Scarcely a week passes but we hear of half a dozen instances of these old mines being started up again, sometimes by the old owners and sometimes by new ones. There are a great many left, however, which might be worked to advantage by the right men with proper experience.

Remarks on Quicksilver.

[Written for the PRESS by SAMUEL PURNELL.—No. 1.]

At many points in the Coast range of California are found deposits of cinnabar of greater or lesser extent. It has, however, been mined successfully in but few places. The reasons are that the metal is seldom found sufficiently concentrated in the rocks to make mining possible; while in the remaining cases the extracted ores are of such low grade that they cannot be profitably smelted. Occasionally small deposits are found that yield very rich ores—60 to 70 per cent.—but it is well known that those deposits which are large and easily mined, are almost invariably composed of ores so poor—one to three per cent.—that they can barely be operated with profit when quicksilvar is at a less price than 50 cents per pound. The price at present being some 40 cents only, we accordingly see the greater part of our cinnabar mines closed, the furnaces cold, and large concerns—that alone remain at work—making little or no money. Perhaps not more than four or five important mines are now in operation in California; and, though the public constantly hears of new and great deposits of cinnabar, they are, as yet, practically undeveloped and valueless, and cannot affect the market price of mercury. This article is written from the standpoint of the producing mines.

That quicksilver will soon rise in value does not seem probable, unless one should look for the still more improbable occurrence of a combination to limit production; and, consequently, the writer thinks that mercury will still farther decline in price, till only those works which can make a profit when it sells below 30 cents per pound can afford to remain in operation.

It would appear to be the rule that quicksilver mines grow constantly

Poorer From the Surface Down.

Taking the New Almaden, the largest and foremost mine on this coast, as an example, we find that in 1850 the ores worked yielded, on the average, 36 per cent.; in 1862, 19 per cent.; in 1865, 11 per cent.; in 1870, 5.23 per cent.; in 1873, 4.87 per cent.—constantly growing poorer, while, at this date, the yield is said to be not over three and a half per cent., and which is considered as low a percentage yield as can be made profitable with the present apparatus, and with quicksilver below 50 cents per pound. The same is substantially true of the balance of the prominent mines of the coast, and the effect of the anticipated decline will be disastrous to their interests. Then only the small deposits of rich ores could be worked, which would not half supply the home demand, and quicksilver would have to be imported from Europe. In short, the quicksilver interests of this coast, so far as the developed and well known mines are concerned, to the ordinary observer appear to be not only on the decline, but in process of extinction; and the object of this communication is to examine the whole ground, to show wherein lies the difficulty in effecting a cheaper production, and to endeavor to point out a proper remedy.

Production.

The celebrated mines of the world are Almaden, in Spain; Idria, in Austria; and New Almaden, New Idria and Redington, in California. The Almaden has been worked more or less since the time of the ancient Romans, and is, without doubt, the most extensive deposit of cinnabar in the world. The mine is now under lease to the Rothschilds of Europe. In 1872 the workings were over 1,200 feet deep, and the mine was reported to be in such bad condition that it was thought it could not much increase its then production. The ores are poor—about 5 per cent.—but their abundance and the cheap labor of the country for their extraction and smelting enables the Almaden quicksilver to control the Eastern trade.

The Idria mine has been worked over 400 years. In 1872 its deepest workings were 750 feet. For many years it has been in charge of the Austrian government, and all the operations of mining and smelting are carried on with the best talent available and the best known apparatus. Hence, the operations at Idria have long been considered as models of completeness, and works elsewhere have imitated their processes. The ores average about 3 per cent.

The New Almaden mine, in California, has been worked, more or less, since May, 1846 to date. From tables furnished by Mr. J. B. Randol, the general manager, we learn that the production from 1850 to close of 1875 was 595,882 flasks, obtained from ores yielding from 36 per cent. in 1850 to 3.35 per cent. in 1875. The average of about four tons of ore is raised from the mine to each ton smelted, which are hand sorted.

Statistics of the New Idria and Redington mines are not at hand; but in general it may be said that the ores of the leading mines of California are so poor that they do not now yield, on the average, over one or two per cent. as they come from the mine. The concentration that is done by hand must necessarily be expensive.

IN the California mine the water coming in is all the pumps can manage, running at the rate of ten strokes per minute steadily, each blast of rock at the bottom of the shaft opening a fresh source of water supply for the pumps to reduce. In fact, it is about an even thing between the pumps and the water at present.

Death of James Lick.

James Lick, ths great phllanthropist, whose nams ie famous for his gifte to science and cbnrity, dled in thle city at one o'clock Sunday morning, at ths ripe age of 80 years. His dlesolution wne painlese and peaceful. The body was free from dieease, and death was eimply the result of the complete wearing out of ths syetem. He had been gradually einking for the previous ten dnys, and he was fully conscious that hie earthly career was rapidly drawing to a close. He conversed cheerfully of his approaching death, and manifested a spirit of thorough resignation. His thoughts were chiefly centered on ths execution of his will, as expressed in ths deed of trust, and his conversations related principally to the consummation of hie public benefactions. The only regret with which he surrendered his life was that he was not permitted to see hie various projects carried out. Mr. Lick had been in ill health for several years past and although hie demise has been several times expected, he has rallied so often that it was expected he would live to see a realization of his plans.

Although Mr. Lick, whose portrait ie seen on thia page, hae been a resident of California for many years, he was very little known even in San Francisco, being a man of eccentric and peculiar habits and averse to mixing with hie fellows. When, however, a few years since, he suddenly announced bis intention of giving his immense fortune to scientific and charitable objects, his name and fame was spread abroad through ths land, and no Californian was better known abroad than James Lick. The money which he had accumulated during hie long life was given to a board of trustees, who were to carry out ths plans devised by the donor on broad and generous principles. Ths philanthropist has taken occasion to change the board of trustees several times, which led some persons to believe that he had repented of his resolution, but in each instance the property was turned over to a new board in the same manner as to the first. He also changed ths trust deed once, by modifying certain bequests, increasing others, and leaving a certain amount of money to hie relatives.

Whatever may have been bis reasons for making ths change, the fact remains that the bulk of his immense wealth is to be distributed in various practical ways to ths people, who should surely allow ths giver to choose where to bestow his fortune without so close a criticism as to all the objects. He was considered an eccentric man, but surely ths eccentricity which leads a millionaire to divest himself of property valued at $5,000,000, and give it, during hie lifetime, to the people among whom he lived, is to be commended, not censured. Thie he did, and whatever may have been his idiosyncrasies, his varying moods or temper, the crowning act of his life shows that ths heart was in the right place, and that hie fortune was bestowed in accordance with long cherished convictions and matured plans. Mr. Lick was a man whom even those nearest to him did not understand or appreciate. He never had credit for ths sterling qualities he possessed. His greatness of wisdom and generosity will be better recognized in ths future.

For presenting a biographical sketch of James Lick the materials are meagre. He lived in seclusion, and even when engaged actively in business private was little known, even to those with whom he was brought in contact. He was born August 25th, 1796, in Fredericksburg, Penn. He was a descendant of one of ths Revolutionary fathers, William Lick, who emigrated from Germany to America previous to ths war of Independence, in which he took an active part. James Lick was taught the trade of a cabinet maker and carpenter, and served for a while in a pianoforte manufactory in Baltimore, Maryland.

His restive spirit, however, attracted him in 1820 to Buenos Ayres, and there he remained for 12 years, accumulating by industry and his speculative insight the good round capital of $40,000. For a season Mr. Lick returned to Pennsylvania, and seriously bent himself toward establishing a manufactory of pianofortes in Philadelphia, but after leaving ground and erecting buildings he gave up the project and returned to Buenos Ayres. Matters were there not to his liking, and he is heard of next at Valparaiso, in Chile, where commerce and pianos gave him occupation for a few years. From Chile he went to Peru, and there devoted himself to his business in cabinet work and pianofortes for 10 or 11 years.

Mr. Lick arrived in San Francisco in 1847, having with him his entire wealth, amounting to the sum of $30,000. He invested all his capital and all earnings in real estate. The most promising portion of the city in those days was then what is known as North Beach. Most of Mr. Lick's investments were made in that locality, and owing to the subsequent abandonment of that section as a business center, advanced but little in value. He extended his investments, however, to other parts of the peninsula which have since become the very heart of the great city. Then, the lots he purchased were more cheap than cost him but a trifle. The lot on which the Lick house now stands is said to have been bought by him for an ounce of gold. All the city property, outside of North Beach, in which Mr. Lick invested, multiplied in value rapidly and built up the immense fortune which he in later years enjoyed. He also invested money in Santa Clara and Los Angeles counties, purchasing in the latter county a portion of the Rancho de Los Felis and the island of Santa Catalina. With the exception of the Lick House lot and the property in Santa Clara, Mr. Lick was rather conservative in the matter of improvements. The structure which bears his name is, however, one of the most notable edifices in the city, and at the period of its erection was far in advance of the times. The property at Santa Clara he improved for his own residence, and, on a piece of land near San Jose, erected a flour mill, on which he lavished about $200,000, almost all the woodwork in the same being of mahogany.

After a lifetime spent in the pursuit of riches, on the 2d of June, 1874, Mr. Lick executed a deed of trust in which he divided nearly all his vast fortune for public benefaction, and appointed a board of trustees. Estimates of the estate at that time placed its value at $5,000,000. We gave at that time the full text of the deed, but as it has since been nullified we append a list of the donations of the last trust deed as it now stands. The present Trustees, appointed about a week before Mr. Lick's death, are: C. M. Plum, E. B. Mastick, Wm. Sherman, Geo. Schoenewald and R. S. Floyd. We omit any account of the schedule of property, and, in speaking of the gifts, summarize them from the deed:

To his son, John Henry Lick, he gives $150,000. To John H. Lick, of Fredericksburg, Pa., $3,000; to Henry Lick, of same place, (his half-

THE LATE JAMES LICK.

brother,) $5,000; To his sister, Sarah Hepler, $5,000; to his niece, $2,000; to another niece, $2,000; to his nephew, Jemee W. Lick, of Santa Clara, $2,000; to Thos. E. Fraser, of San Jose, $2,000.

The Trustees are required "to expend the sum of $700,000 for the purpoes of purchasing land, and constructing and putting up on such land, as shall be designated by the party of the first part, a powerful telescope, superior to and more powerful than any telescope ever yet made, with all the machinery appertaining thereto and appropriately connected therewith, or that is necessary and convenient to the most powerful telescope now in use, or suited to one more powerful than any yet constructed; and also a suitable observatory connected therewith. This is in charge of the Regents of the University of California, and the telescope and observatory are to be known as the Lick Astronomical Department of the University of California."

The Protestant orphan asylum of San Francisco receives $25,000.

The sum of $25,000 is given to the city of San Jose to erect a free orphan asylum, without regard to creed or religion of parents.

The Ladies' Protection and Relief Society of San Francisco receives $25,000.

The Mechanics' Institute of San Francisco receives $10,000 for the purchase of scientific and mechanical works.

The Society for the Prevention of Cruelty to Animals of San Francisco receives $10,000, with a hope that similar societies will be organized in other towns of California.

The sum of $5,000 is to be expended in a monument to his mother, Sarah Lick; $5,000 for a monument to his father; $5,000 for a monument to his grandfather William Lick, who died near Morristown, Pennsylvania, at the age of 104 years, to commemorate the services rendered by him in the American struggle for independence, and the hardships he suffered at Valley Forge and other places during the struggle; all of said monuments to be erected at Fredericksburg; and the further sum of $5,000 in the erection of a granite monument to the memory of the sister of the party of the first part, named Catherine, to be placed at her burial place, Pennsylvania.

Out of the proceeds of the estate the sum of $100,000 is set aside to found an institution to be called the "Old Ladies' Home," as a retreat for women who are unable to support themselves and who have no means of their own. The trustees of this are A. B. Forbes, J. B. Roberts, Ira P. Rankin, Robert McElroy, and Henry M. Newhall.

The sum of $150,000 is to be expended for free baths in the city of San Francisco. H. M Newhall, Ira P. Rankin, J. D. B. Stillman, and John O. Earl are the trustees.

The sum of $60,000 is to be expended for a monument to Francis Scott Key, author of the "Star Spangled Banner." This is to be erected in Golden Gate park.

The sum of $100,000 is to be expended in a group of bronze statuary at the City Hall, which shall represent by appropriate designs and figures the history of California; first, from the early settlement of the Missions to the acquisition of California by the United States; second, from such acquisition by the United States to the time when agriculture became the leading interest of the State; third, from the last named period to the first of January, 1874.

The Trustees are to found and endow, at a cost of $540,000, an institution to be called "the California School of Mechanical Arts," the object and purpose of which shall be to educate males and females in the practical arts of life, such as working in wood, iron and stone, or any of the metals, and in whatever industry intelligent mechanical skill now is or can hereafter be applied; such institution to be open to all youths born in California. The institution shall be founded and endowed under the direction of said Dr. J. D. B. Stillman, Horace Davis, A. S. Hallidie, John Oscar Eldridge, John O. Earl and Hon. Lorenzo Sawyer, and the survivors of them.

After making these payments, the residue and proceeds of the estate is to be conveyed in equal portions to ths California Academy of Sciences and the Society of California Pioneers, to be expended in ths purchase of a library holding natural specimens, chemical and philosophical apparatus, rare and curious things useful in the advancement of science, and generally in carrying out the objects of the societies.

Mr. Lick reserved to himself his homestead in San Jose, during his life, but this now goes to the Pioneers and Academy of Sciences. He had previously given to these societies each a lot 80x275, on Market and Fourth streets, the lots being valued at about $250,000 each. These lots are aside from the deed of trust and the societies now have possession of them.

The Society of California Pioneers, of which Mr. Lick was President, took charge of the obsequies. The remains lay in state at the Pioneers' hall on Monday and Tuesday. On Wednesday the funeral services were held. The body was escorted to the grave by the Pioneers, Academy of Sciences, students of the University, Mechanics' Institute and city officials, etc. The funeral services were held at the Mechanics' Institute pavilion, and the remains temporarily placed in a vault in the Masonic cemetery, until their final removal to Mount Hamilton—the site of the Lick Observatory. To one who has visited Mount Hamilton it is no mystery that Mr. Lick should choose it as his final resting place. We believe that this dead of his with reference to Mount Hamilton will be the greatest monument of his life.

Book Notices.

POPULAR HISTORY OF THE UNITED STATES.—William Cullen Bryant and Sydney Howard Gay have succeeded in compiling the most attractive history of the United States yet published. It covers a period of time from the first discovery of the Western hemisphere by Northmen to the end of the first century of the Union, and is preceded by a sketch of the pre-historic period and the age of the mound builders. The work is by no means a hackneyed reproduction or piecing out of previous histories, but is fresh, sparkling and interesting, written in excellent style and effectually covers all the ground. It forms a complete and compact history of the United States, adapted to popular perusal through its attractive narratives, and may be accepted as an authority through its full and accurate presentations of all the facts of our career as a nation. Among previously existing works upon the subject, that which is most attractive in style is too voluminous for popular use, and that which is most complete ends at the year 1820, leaving untouched the record of the last half century, into which the most important events in the history of the nation are crowded. Bryant's history is entirely free from any sectional bias. It is not composed of dry facts, but chronicles the intellectual growth of the people, the ameliorations of manners, the changes in habits and costumes, the advance in science and art, the progress of invention, the relation of classes, the increase or want of prosperity, the moral condition of society, and the every-day life of the people. It will be complete and at the same time popular; that is to say, without detracting in the least from the dignity of the work as a history, its authors present the narratives in such a form that it must attract even younger readers. The history will be an authority as a work of reference. The first volume only has been published so far, but there are to be four large royal octavo volumes in all. The first volume is profusely illustrated. The drawings have been executed upon wood and steel by the first engravers in this country and Europe, and probably no original work equalling this in the variety and excellence of its illustrations has ever before been offered to the American public. The first volume has a steel engraving of William Cullen Bryant, four full-page engravings on steel, 12 full-page woodcuts and about 300 illustrations in the text. The work is sold exclusively by subscription. A. Roman & Co., No. 11 Montgomery street, are the general agents.

FATIGUE OF METALS UNDER REPEATED STRAINS. "The fatigue of metals" is the name which has been given to the effect produced by oft-repeated strains or impacts. Spangenberg's experiments, an account of which, translated for *Van Nostrand's Magazine*, is given in the treatise under consideration, were in continuation of Woehler's. The results of these very important experiments have been before the profession for some years, but, strange to say, have attracted no attention; and tests of iron and steel still go on for the purpose of determining their elasticity, their elongation under strain, their ultimate strength and other qualities, while Woehler and Spangenberg's experiments show that it is very doubtful that these bear any proportion to the durability of metals. These experiments prove that there is a limit of strain within which iron is practically indestructible, and that that limit is but little over 30,000 pounds per square inch for the best iron. It is to be hoped that the translation of Spangenberg's book will excite sufficient interest to lead to a continuation of the experiments in this country. This little work, one of Van Nostrand's Science Series, (No. 23), is for sale by Payot, Upham & Co.

TEETH OF WHEELS.—This is another of Van Nostrand's Science Series, and is a practical treatise on the teeth of wheels, with the theory and use of Robinson's odontograph. It was written by S. W. Robinson, professor of mechanical engineering in the Illinois Industrial University. The volume has resulted from an effort to bring before the mechanical public improved facilities for obtaining correct gearing. Correct gear teeth are essential for the economic transmission of power, as well as extremely desirable for avoiding needless rattling. Many of the cast gears introduced into mills and factories may properly be termed rattling machines, and simply because the designer had too vague a conception of the theory of gearing, or because he sought to avoid the trouble of laying them out. This little manual and the odontograph are intended to contribute toward relieving these inconveniences. This book is really useful for machinists and foundrymen.

THE entire sophomore class at Williams college, Massachusetts, has been suspended for "rushing" freshmen.

THE BUCKMINSTER ROCK DRILL.

The Most Efficient Rock Drill in the Market.

LIGHT, STRONG and DURABLE.

No External Machinery Liable to Injury from Rough Usage, as all the Working Parts are Enclosed in the Cylinder and Valve Chest.

A TRUE SMOOTH HOLE EVERY TIME. THE MOST ECONOMICAL DRILL YET MADE.

THE WORKING PARTS OF THE DRILL ARE FEW AND SIMPLE IN ARRANGEMENT, SO THERE IS NO LIABILITY OF INJURY. THE CLAMPS FOR HOLDING THE DRILL ON THE TRIPOD, FOR HOLDING THE DRILL TOOL IN POSITION, AND FOR FIXING THE WEIGHTS ON THE LEGS OF TRIPOD, ARE ALL IMPROVED AND VERY EFFECTIVE.

The device for rotating this Drill has few parts, and can not get out of order. There is no chance for wear. The motion is positive, and never fails of action. The Drill Carriage can be turned clear round the column, and can also turn in a complete circle on the head of the clamp.

All parts subject to wear are of the Best Cast Steel, and all made to gauge and interchangeable.

This is the Lightest and Strongest Rock Drill yet invented. Being nearly all Cast Steel, it is easily handled and moved, as all superfluous metal is dispensed with.

We also call the attention of those interested to the Horizontal Air Compressor furnished with the Buckminster Drill when desired. It is Economical, Light, Easily Run and conveniently portable.

We claim that the Buckminster Drill will do as good work as any in the market, at a much less expenditure of power, and a great decrease in first cost of machinery. Drills made all the usual sizes.

Mining Companies Desiring Rock Drilling Machinery should Examine this Drill and Air Compressor, and we are confident that it will give satisfaction. Address,

PACIFIC IRON WORKS,

FIRST & FREMONT STS., NEAR HOWARD, S. F.

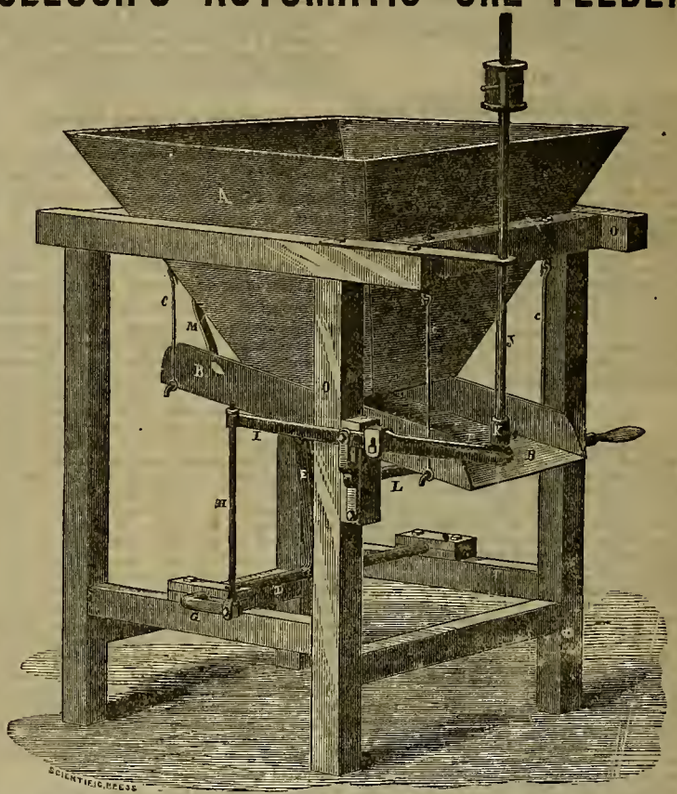
BIGELOW PORTABLE ENGINE AND BOILER, FROM 4 TO 15 HORSE POWER.
FOR SALE CHEAP.

STODDARD'S PATENT CONDENSER, for All Kinds of Steam Pumps

TULLOCH'S AUTOMATIC ORE FEEDER.



The TULLOCH AUTOMATIC ORE FEEDERS have been practically tested during the last year and a half in 40 mills, of from five to 80 stamps each, and have, in every case, given perfect satisfaction. The Tulloch machine is so constructed that the drop of the stamp feeds the ore in just such quantities as the stamps require. Each drop regulates the supply required for the next drop, whether it be more or less, and this is the true principle of an automatic feeder. The tray moves longitudinally, and a stationary scraper forces the material forward at each backward movement of the tray, thus insuring the perfect feeding of all classes of ore, whether it be dry or wet.

We appeud a few extracts from the many testimonials which we have received from mill men and practical mining men, of the effectiveness and positive action of the Tulloch Feeder. We do not depend solely upon these testimonials, as we are aware that testimouials are easily secured for almost any machine, but the high character of the parties certifying to those herewith given, will establish their value and genuineness:

Mr. Jas. G. Fair has 28 in use; says: I regard them superior to any Feeder with which I am acquainted; I consider no mill perfect without them. Mr. E. R. Burke, Sumner mine, Kern county, has 16: They never get tired; no man living can feed a battery as well; they save us in labor alone $48 a day. Mr. Green, of the Phœnix mill (12), Amador, writes: The first machine we had is working away; is as good as ever; have not spent a dime on it; in nse 14 mouths; you need fear no competitiou on wet ores. Mr. W. H. Armstrong, of Consolidated Virginia mill: We are running 60 stamps with your Feeders; they give unhounded satisfaction; they have not cost the company one dollar since atartiug up. Mr. H. C. Bidwell, Supt. Green Mountain and Gold Stripe companies, Plumas county, writes: From the start they have done splendidly; no tronble whatever; requiring but little atteution; a boy can manage them; the saving in both labor and castings is fully one-half over the old style of feediug by hand. Mr. Presto . writes: I have four of your Automatic Self Feeders, and my mill men each and all say they are the best they have ever used. They are an improvement on all I have ever seen, being simple in construction, and good for either wet or dry crushing; refer to over 40 mills using them; they are guaranteed to give perfect satisfaction. Send for circulars.

F. OGDEN, 417 Market Street, S. F.

ANGELL'S CHARCOAL DENTAL SOAP for Whitening and Preserving the Teeth. J. W. ANGELL, Prop., San Francisco

SUTTER CREEK, February 26th, 1875.

MESSRS. DEWEY & CO.—I have received my Letters Patent through your agency. And, for your promptness, accept my thanks. Yours, S. N. KNIGHT.

San Francisco Cordage Company.

Established 1856.

We have just added a large amount of new machinery of the latest and most improved kind, and are again prepared to fill orders for Rope of any special lengths and sizes. Constantly on hand a large stock of Manila Rope, all sizes; Tarred Manila Rope; Hay Rope; Whale Line, etc., etc.

Continued from Page 238.

Idaho.

THE MINES.—Idaho *Avalanche*, Sept. 23: The prospects of Owyhee look better to-day than they have for the past eight or nine months.

Captain Bledsoe paid off at the Poorman on last Wednesday. He says the mine is looking remarkably well and is yielding ore of an excellent quality from a good sized vein.

Ore is now being hauled by Pooey's teame to the Elimore mill to be crushed shortly. Some samples brought down from the mine the other day will run, from appearances, fifty per cent. silver, others literally filled with gold. An item concerning the yield of this mine in early days is somewhat interesting. Out of one stope, just above the present works, $680,000 were taken from a space of 100 feet in depth by 135 feet in length. This mine yielded, in the short time it was worked, $1,490 000.

John Mineer, Esq., paid off the Empire mine's creditors last Thursday. A small force has been engaged stoping from between the fifth and sixth levels where the ledge is three feet thick of good looking ore, carrying gold mainly. A limited quantity of this ore is being hauled to the Elmore mill to be reduced as soon as some repairs now being made on the mill are completed.

The Belle Peck is being vigorously worked with a full crew of men and is looking splendidly, the tunnel being in nearly 700 feet along the ledge.

The Potosi's tunnel is 400 feet in length on the ledge. A fine lot of ore is already out and stoping going on daily. The ledge is of good size and rich all the way.

Bahcox has had two and three-quarter tons of ore from the Crown Prince mine, worked by Mr. Trask's arastra, that yields about $80 per ton. This proves that to be a rich mine.

These encouragements, together with the fact that operations have been resumed on the Golden Chariot; South Mountain to be started up again; T. W. Jones & Co.'s mill in process of erection to reduce the abundant supply of valuable ores at Wagontown; and the probability of the Maggie mining company, at Frauconi, resuming; all combine to make the outlook more cheering than it has been for a long time.

There are various other mines, not enumerated here for want of time to visit them, whose prospects will appear in our next issue.

Montana.

MINING PRODUCTS.—Helena *Independent*, Sept. 24: It is pretty certain that the mining products of Montana this year are greatly in excess of last. It is true that in almost every locality in the Territory the want of proper milling facilities has been felt. In some of the mining districts unusual exertions have been made to supply the deficiency; or at least to put enterprises on foot that will in time grow into undertakings commensurate with the wants of the Territory. But in spite of all the drawbacks which our mining industry has encountered, the increase in the gold and silver product of Montana has been steady and rapid. From the best attainable sources of information these conditions are largely shared by those other States and Territories whose chief industry is similar to our own. Notwithstanding the great discouragement which the late fall in the price of silver occasioned, it in no wise diminished production; nor has the recent rise in the price of bullion lent to it any unusual activity. The fact indeed is plain that the production is steady and is rapidly assuming the condition of those other industries which help to develop communities and build up prosperous States and Territories.

Wyoming.

BLACK HILLS ITEMS.—Black Hills *Pioneer*, Sept. 9: While visiting some of the claims on Deadwood yesterday, we called on Messrs. E. B. Buckley, Smith Engher and our old-time friend George Stokes. These gentlemen own No. 10, and from its present appearance we should like to have a finger in that pie. The gulch at this point is very narrow, and it was supposed that the claim was nearly worked out. But these gentlemen conceived the idea of tunneling in on the southern side, on which there is a neck—or perhaps a better expression might be, bench. The creek rim was found when about three feet in, and from that on for 30 feet, the distance now reached, the dirt has yielded from 25 cents to $1.50 to the pan. It is believed by many old miners that this old channel on Deadwood has not yet been struck, and that the gold that has been taken out this summer is a second deposit. Should this be the case, this gulch will prove to be the richest ever discovered. Messrs. Chisem & Son sold out their claims, Nos. 4 and 5 below discovery, last Thursday to Robert Neale for $2,200. Like most of the adjoining claims, the creek had on 4 and 5 is about worked out. But the past week's experience proves that this is no evidence that all or nearly all of the "yellow dross" has been captured. For instance, Jack McCleary, on No. 9, after finding good pay above bedrock, sunk a hole four feet through it, near his upper line, and found $2.50 to the pan. No. 10 (Buckley, Enghar & Co.) drifted into their bar and found the identical body of gravel that has made Noe. 1 and 2 so famous. The streak is at least 14 feet in width and seven feet deep, and prospects from 50 cents to $1.50 to the pan. A very few weeks will demonstrate that, as to the richness of Deadwood, the half has not been told us. Many of the miners on Whitewood and Deadwood have made their little pile in three short months, and are now selling their claims, and going back to their homes to spend the winter.

THE CITY'S CENTENNIAL.—Arrangements are being made to celebrate the Centennial of San Francisco and the Mission Dolores. "On the ninth of October, 1776, having blessed the place and erected the cross, the Fathers took formal possession of the mission and began the work of conversion." The eighth of October has been selected for the demonstration, as it occurs on a Sunday, and as there is some doubt as to whether the eighth or ninth is the correct date. The proceedings will commence at 10 A. M., when Grand Pontifical High Mass will be celebrated in the Mission grounds.' At the conclusion, Archbishop Alemany will address the audience in Spanish, Bishop Grace, of Minnesota, will preach in English; then the assemblage will repair by the shortest route to the Mechanics' pavilion, where the commemorative exercises will be held. Hon. John W. Dwinelle will deliver an address in English, and General Vallejo will do the same in Spanish. Immediately afterwards the Archbishop, the clergy, and as many of the audience as wish, will return to the Mission for the purpose of laying the foundation stone of the new Mission church. The old building will not be removed, but care will be taken to preserve it as long as possible, as a memorial, of the fittest kind, of the planting of Catholicity on this spot, and of the origin of San Francisco.

STEPS are being taken at Carihoo to test the numerous quartz ledges abounding in that locality.

PATENTS & INVENTIONS.

A Weekly List of U. S. Patents Issued to Pacific Coast Inventors.

FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

FOR WEEK ENDING SEPTEMBER 19TH, 1876.

BUTTONS.—Samuel Adame, Antioch, Cal.
HOSE COUPLINGS.—Orrin Collier, Sacramento, Cal.
TRACE HOOKS.—Thomas J. Hubbell, Napa City, Cal.
BELLOWS VALVES.—James Campbell, S. F.
PROCESS AND APPARATUS FOR REFINING AND PACKING SULPHUR.—Edwin J. Fresser, S. F.
HINGE JOINTS.—Menzo Spring, S. F.
STEAM GOVERNORS.—John K. Trne, S. F.
STEM WINDING DEVICE FOR WATCHES.—Albert Troller, S. F.
FLUMES.—Sem'l C. Dike and Sidney M. Brown, Yon Bet, Cal.

REISSUE.

HYDRAULIC NOZZLES.—Henry C. Perkins, North Bloomfield, Cal.

FOR WEEK ENDING SEPTEMBER 26TH, 1876.

DENTAL PLUGGERS.—Cassius M. Richmond, S. F.
AXE SETS AND GAUGES.—William C. Carleton, Boise City, Idaho Ter.
SAWMILL HEAD BLOCKS.—William Phillips, Colfax, Cal.
RAILWAYS.—Andrew S. Hallidie, S. F.
WATER MOTORS.—John B. Morrow, S. F.
TRUCKS.—William L. L. Pierce, S. F.

REISSUE.

VAULT COVERS.—Thomas Thompson and Thornton Thompson, S. F.

*The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of mention:

WIRE ROPE STREET RAILWAYS.—A. S. Hallidie, San Francisco. This invention relates to that class of street railways in which the cars are propelled along the track by means of an endless wire rope or chain, which is arranged to travel in an underground tube or tunnel, and in which a gripping device is used to connect the cars with the rope through a slot in the tube. This system of propelling railway cars has long been used upon uniform planes. Sometimes these planes were inclined and sometimes horizontal, but previous to Mr. Hallidie's invention it was never made available for long lines of railway which pass over changing levels, or for propelling cars over steep inclines in the length of a road which was operated by horse or other power at either end of the line, so that the same car could proceed from one system of propulsion to the other without trouble or delay. The invention is intended to accomplish this object by providing a separate truck or car, which is called a dummy, for supporting the gripping device and which is a permanent part of the road, while the car to be propelled is simply connected by a coupling with this car or dummy so that it can be disconnected and run upon another track without disarranging any of the mechanisms connected with the gripper. This particular patent of Mr. Hallidie's covers the truck or dummy having the permanently attached gripping device.

HINGE JOINT.—Menzo Spring, San Francisco. This invention, while susceptible of a wide range of applications, is more especially adapted to the needs of that class of hinge joints which are employed in artificial legs at the knee joint or articulation, where the combined qualities of lightness and strength to resist the usual strain on such parts and a distribution of bearing and wearing are essential to obviate and overcome the constant wear by friction, are a great desideratum; or, if in case the difficulty be not entirely overcome, a means is afforded whereby a repair may be readily effected without injury to the artificial leg or joint. As joints of this class are apt to become worn by the constant use to which they are subjected, a split is formed on the hub through which one end of a thin flat wire (equal in thickness to the portion worn away), may be inserted, and such wire is then bent half way around the opposite end of wire inserted in the opposite split, thus effectually rendering the joint tight.

BELLOWS VALVE.—James Campbell, San Francisco. The object of this invention is to provide a combined valve and valve seat, which can be manufactured independent of the pipe or tuyere of a blacksmith's bellows, and which can be slipped into the pipe or tuyere so as to fit in it and form a partition across it, the valve being a portion of the partition. The object of this valve is to prevent the gas from passing or being drawn from the fire into the bellows when it is not in action. By the method of construction referred to, the invention avoids the expense of constructing the valve a permanent part of the pipe and avoids the unsightly square enlargement heretofore employed to contain this valve. The independent valve can be constructed quite cheaply and applied to the nozzles now in use.

OPERATING SAW-MILL HEAD BLOCKS.—William Phillips, Colfax, Placer county. Mr. Phillips' patent covers certain improvements in operating saw-mill head blocks, and consists, first, in a novel connection with the pawl lever (which turns the ratchet and pinion to operate the rack on the head block) so that all lost motion of the pawl between the teeth is taken up before the lever begins to move, and consequently the log will be moved exactly as much as is indicated upon the rule over which the lever passes, and all the cuts will be made of the same size. The invention further consists in the use of a curved rack having subdivisions and an adjustable stop, by which the exact thickness of the lumber will be insured at each cut.

STEM WINDING DEVICE FOR WATCHES.—Albert Troller, San Francisco. The invention relates to a cheap and simple device for winding watches by the turning of the stem, and it consists of a spirally slotted barrel which is turned alternately in one direction and the other by the stem, and the slot acts upon one end of a knee lever. The opposite end of this knee lever actuates a pawl so as to turn the winding ratchet. The mechanism is simple and can be easily repaired by any watch-maker, and in its operation does not necessitate the releasing of the crown until the watch is wound up.

COMBINED FERRULE AND TRACE FASTENER FOR WHIFFLETREES.—Thomas J. Hubbel, Napa. The object of the invention is to combine a trace fastener of superior construction with the ferrule that fits over the ends of the singletrees. The device can also be applied on the ends of neck yokes, so as to provide a convenient fastening for the breast-straps. The same device can be used on the ends of neck yokes for providing a fastening for the breast-straps.

California at the Centennial.

We gave last week the awards of Centennial exposition premiums to Pacific coast exhibitors so far as they are announced. It seems to be the general opinion that the coast has fared very well at the hands of the juries. The final judgment will of course depend upon the full list when it shall be made up. There was felt considerable anticipation of ill treatment among the exhibitors of California wines, and fears were expressed that other regions which were represented on the wine jury would obtain the benefit of partiality. There arose a better feeling from the fact that a Californian, Mr. J. H. Johnson, of Santa Barbara, was added to the official wine tasters, and justice was expected through his efforts. The awards for wine, show that this expectation was well founded.

The best deeds of our State at the exposition were done at the fruit display, September 9th There seems to be some difference of opinion concerning the excellence of the exhibit. It is however, pleasing to note in the correspondence from Philadelphia that the popular verdict was loud in glory of our fruit, although for reason of early picking and transportation it must have been very inferior to the fully matured and luscious profusion under which our home tables bend. A correspondent of the *Chronicle* writes: "Prof. Bsird, of the Smithsonian Institute at Washington, who is here in charge of the Government display, came around one day and made a careful examination of our fruit exhibit, expressing great satisfaction with what he saw; and the next day he brought Professor Huxley and wife, of England, and found a rare pleasure in showing the productions of California to such lovers of nature and of the good and beautiful. They seemed familiar with the fruits, as grown under glass, but expressed great surprise that such delicate fruits could be brought to perfection in the open air in California. As Professor Huxley gave his hand in parting he said, 'I had a desire to visit California, but now I deeply regret that I must return to England without seeing your beautiful country.' Although this letter is taken up with a report of the fruit display, and only half the story is told, it is due to the exhibit made, on account of its immense importance to California. Indeed, the State is under very great obligations to the venturesome gentlemen who had the courage to gather up this fruit, pay the heavy freight bills and send on a capable gentleman to place it on exhibition. The sad mistake made by the Legislature in refusing to appropriate a single dollar in aid of an exhibit of the resources of California at this grand gathering of the nations of the earth and of our own people, can only be realized by a visit to the Centennial grounds."

A dispatch from Philadelphia, Oct. 3d, says: "The party now in charge of what purports to be California fruit in pomological hall sells Florida shaddock for California oranges, and is reported to be mixing Eastern fruit with that of California, and so vending it. The fruit judges refuse to enter the California fruit for competitive exhibition because it was sold in the hall. The interest and standing of the California exhibits have been lowered by this method of procedure." This matter should be inquired into and justice meted to the fraud.

WOODWARD'S GARDENS embraces an Aquarium, Museum, Art Gallery, Conservatories, Tropical Houses, Menagerie, Seal Ponds and Skating Rink.

GLENN'S SULPHUR SOAP cures skin diseases by its specific action on the capillary vessels which have been morbidly impressed by their impure contents, and which are restored to a healthy condition by the counter-irritant influence of the sulphur. Sold everywhere.

ENCROACHMENT OF THE SEA.—Since the commencement of the Madras harbor works the sea, says *Engineering*, has been gradually but steadily encroaching on the beach at Royalpooram, and a groyne to the north of the railway shears, around which one could pass dryshod a few months since, has now some six feet of water at the end of it. One result of the continuous scour which is going on is that a large number of iron rails, the property of the Madras railway company, have been disembedded. These rails must have been dropped where they are now being found about the time of the commencement of railway operations in Madras presidency.

New Incorporations.

The following companies have filed certificates of incorporation in the County Clerk's office at San Francisco:

CHAMPION M. Co.—Sept. 30th. Location: Pacific Coast. Capital stock, $10,000,000. Directors—H. H. Lawrence, Samuel Locke, John D. Wilson, W. H. Duryea and J. E. Wilson.

CARELESS TOM G. & S. M. Co.—Sept. 29th. Location: Mono Co., Cal. Capital stock, $5,000,000. Directors—John M. Moore, A. O. Bradford, Jas. Tobin, C. C. Marsh and J. L. Trask.

EL PASO S. M. Co.—Sept. 30th. Location: California. Capital stock, $10,000,000. Directors—R. J. Trumbull, R. Guy McClellan, W. H. Knepp, T. L. Bibbins and A. D. Hatch.

KNIGHT'S American Mechanical Dictionary is a book for all persons who make, buy, sell, use, or want to know anything about tools for machines, or are curious as to the history and development of mechanic art. It is a descriptive word-book of tools, instruments, machines, chemical and mechanical processes; civil, mechanical, railway, hydranlic and military engineering; a history of inventions; general technological vocabulary; and digest of mechanical appliances in science and the industrial and fine arts, etc. For circulars or price address or apply to A. Roman & Co., wholesale and retail booksellers, 11 Montgomery street, San Francisco.

ISSUED OCT. 1st, 1876.

Testing and Working Silver Ores.

The above is the title of an illustrated work of 114 pages, for miners and prospectors by Chas. H. Aaron, which has just been issued by Dewey & Co. Mr. Aaron has managed to give many useful hints and suggestions, free from all technicalities, and in such a style as to be easily comprehended. It is written for the miner, with no chemical symbols or metallurgical technicalities to confuse those who are not chemists or metallurgists. The following summary of the contents of the work will give an idea of its scope:

Under the heading of the first chapter, "Testing Ores for Silver," we find paragraphs on ore formation, test for silver, with heat and water, acid or blow pipe. In speaking of testing for a process, the extent and richness of ores is considered, smelting ores, selecting and working sample, appliances for testing, roasting, etc. Under the head of "Working Ores" the author describes Aaron's process, has something to say of superheated steam, preparation of dichloride of copper and protochloride of copper, use of copper and iron, quantity of chemicals, carbonate of lime, chloride ores, amalgam, Patchen's process, etc. He also describes this method of working roasted ores, treatment of base metals, stirring, heat of furnace, want of sulphur, etc. Under the head of "Leaching Processes" are the titles, Smelting, Mexican process, Kroencke's process, Chilean process, etc. Under "Pulverizing Machines" are described the arastra and its construction and operation, stamp batteries, screens, Crocker's trip-hammer battery, Paul's pulverizing barrel, Kendall's battery, Noice's pulverizer, a cheap rock breaker, etc.

In speaking of amalgamators the author describes a cheap amalgamator, grinding the ore, directions for making a barrel, preventing mechanical wear, use of quicksilver, copper in bars, Freiberg barrel, cheap barrel, trough, barrel on rollers, Aaron's amalgamator, separator, etc.

He describes an improved retort, roasting furnace, furnace tools and furnace building. Among the miscellaneous mention may be found Aaron's leaching apparatus, with two or three different arrangements, a small mill, sampling tellings and settling tanks, dichloride of copper, etc.

The book is a serviceable one for miner's and prospector's use. Price, post free, (in leather,) $2.00. Address Dewey & Co., MINING AND SCIENTIFIC PRESS, 224 Sansome street, San Francisco.

HOW TO STOP YOUR PAPER.—If a subscriber wishes to stop his paper, do not direct the postmaster to return your paper. That will not stop it. Do not write upon it and return it yourself. That lays you liable to a fine. There are three ways to stop it: 1st. When you subscribe, state that you wish the paper to stop at the expiration of the time paid for. 2d. If you did not so expressly order, send a postal card, to reach us any time before the expiration. 3d. If you have neglected these two simple methods, and the time to which you have paid is past, send a letter enclosing pay for each paper issued since your subscription expired, at the rate of eight cents a copy or 33½ cents a month. If your paper does not stop promptly thereupon, you may be assured your letter has been miscarried; and, to test the fact, send a "postal" at once, that measures may be instituted for finding it or recovering the money.—*N. Y. Independent.*

SAN BERNARDINO, Cal., Sept. 29th, 1876.

MESSRS. DEWEY & CO., S. F.—

Gentlemen:—I was very much pleased a few days ago to receive my patent in the "Pastry Bureau" case, and I take great pleasure in recommending your agency to those who may have business in that line, particularly the first time. The courteous, prompt and efficient manner in which you act as patent solicitors is certainly the highest recommendation an inventor could ask; and to this fact I am pleased to attest. Hoping that our mutual interests have not ended with this successful issue, for I shall need your services in future, I remain truly yours, J. R. FELTER.

PAUL'S DRY PROCESS.

I am now prepared to test gold and silver milling ores in any quantity from FIVE POUNDS to FIFTY TONS and assert my ability to prove, by machinery NOW UP, and open to public inspection, and by practical testing of its merits, that I can increase the yield of gold mills, working wet batteries and copper plates, from FIFTY to ONE HUNDRED PER CENT., and on silver ores a much larger percentage than by pan amalgamation, and at less expense than any known method of working quartz will; and from some "gold" ores of California can extract more silver extra with the gold, which is now lost, than all the expenses of mining and milling. Having had 25 years' practical experience in milling gold and silver ores, I presume to know where of I speak, and AM PREPARED TO PROVE ALL I ASSERT. These mills, for simplicity, cheapness, practicability and perfection in working, challenge the skill of the age to surpass. Quartz miners who desire to investigate and have their ore tested, are invited to a critical examination of the machinery and process, and can receive permits for examination, particulars and pamphlets explaining process by calling at my office. ALMARIN B. PAUL.

Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

Eagle Quicksilver Mining Co.—Location

of works, Santa Barbara county, Cal. Principal place of business, San Francisco, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 30th day of September, 1876, an assessment (No. 9) of two hundred and fifty ($250) dollars per share was levied upon all the issued stock of said company, payable immediately, in gold coin of the United States, to the Secretary, at his office, rooms 5 & 6, No. 302 Montgomery street, San Francisco, Cal.

Any shares upon which said assessment shall remain unpaid on Wednesday, the 28th day of November, 1876, shall be deemed delinquent, and will be duly advertised on Saturday, the second day of December, 1876, for sale at public auction, and unless payment shall be made before, will be sold on Monday, the fourth day of December, 1876, as provided by the articles of agreement of said company, to pay the delinquent assessment, together with cost of advertising and expense of sale. By order of Board of Trustees. WM. H. WATSON, Secretary.

Cincinnati Gold and Silver Mining Co.

Location of principal place of business, San Francisco, Cal.

NOTICE.—There are delinquent upon the following described stock, on account of assessment, levied on the 29th day of August, 1876, the several amounts set opposite the names of the respective shareholders, as follows:

THE O'HARRA

CHLORIDIZING FURNACE.

Guaranteed to Chloridize from 85 to 95 per cent. of any gold or silver ores that are not more profitable for smelting. Will also desulphurize ores and put them in proper shape for working in cupola furnaces.

Cost of Roasting and Chloridizing by this Process:

Two cords of wood at $6	$12.00
Two firemen at $4	8.00
1500 lbs of salt at 1½c	22.50
Wear of shoes and power	1.50
Cost for 15 tons	$44.00
Cost for one ton	2.93⅓

In a furnace of three or four times this capacity the cost is decreased by 20 per cent.

The furnace is now working successfully at the Pope Consolidated Co.'s mines, in the Peavine District. For further information, apply to

D. J. O'HARRA,

Reno, Nevada.

Diamond Drill Co.

The undersigned, owners of LESCHOT'S PATENT for DIAMOND-POINTED DRILLS, now brought to the highest state of perfection, are prepared to fill orders for the IMPROVED PROSPECTING and TUNNELING DRILLS, with or without power, at short notice, and at reduced prices. Abundant testimony furnished of the great economy and successful working of numerous machines in operation in the quartz and gravel mines on this coast. Circulars forwarded, and full information given upon application.

GIANT POWDER,

Or DYNAMITE,

Manufactured Under ALFRED NOBEL'S Original and Only Valid Patents for

NITRO-GLYCERINE POWDERS.

Both Grades of GIANT POWDER have been much Improved, and we assure those who are engaged in Blasting Operations that all Imitations of our Powder, such as Hercules, etc., are, notwithstanding any assertions to the contrary, Inferior to the GIANT POWDER or DYNAMITE, which neither in Europe nor the United States has been superseded by any better or stronger Blasting Agent.

Infringers of our Patents are trying to Deceive the Public by ludicrous and bombastic advertisements but when such tricks are considered necessary, it is invariably done to recommend an inferior article, and no sesible man will be deceived by such advertisements as are issued from time to time in this pape.

We would call attention to the fact that the GIANT POWDER COMPANY employ an able Chemist, whose principal business is to experiment on Nitro-Glycerine Powders, with a view of improving these compounds so as to satisfy the consumer in every respect.

For the liberal support we have received from the public we are very grateful, and respectfully sk a continuance of the same for the legitimate company, which obtained its patents at a very large price paid the inventor, and to rely upon our statement that the GIANT POWDER or DYNAMITE has not been equaled by any other Powder, nor is it likely that it will be.

Both grades of Powder are now almost entirely free from fumes, and those which are yet evolved by a blast are not at all injurious to the health.

☞ We beg leave to assure the public that our suits against the Hercules Powder Manufacturers are vigorously prosecuted in the higher United States Courts. ☜

We respectfully solicit orders for our Powder, which is the only safe and reliable Nitro-Glycerin compound made.

SINGLE, DOUBLE and TRIPLE FORCE CAPS,

And the very best Electric Exploders always on hand; also, all grades of Fuse at Manufacturers' Prices.

VOLUME XXXIII. Number 16.

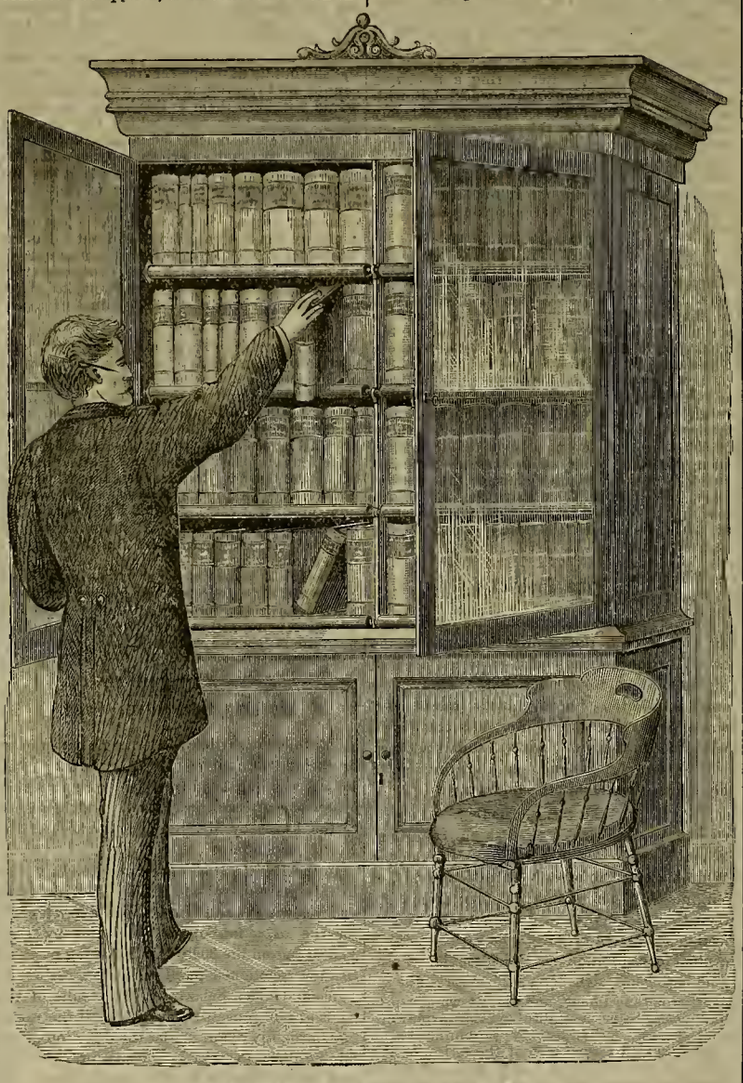
Roller Shelf Edge.

Judge a rich man by his looks,
Judge a wise man by his books.

After exsmining a man's library closely, a good judge of hnman nature can nenally give its proprietor a chart of his tastes and traits of character almost as well as a phrenologist who makes an examination of his cranial bumps, and possibly quite as correct a one as an ordinary person wonld make after becoming thoronghly and intimately acqnainted with the individnal. If we were to call upon a person with whom we were not acquaintsd, and the servant shonld nsher ns into the library, and leave us to our thonghts while ths gentle man made his toilet, we would first examine *the extent* of his library. If it was a small, cramped affair, and the honse was pretentious in style, we should at once set the proprietor down as an ignorsmus, and devoid of literary taste. We wonld next examine the *general character* of the books npon the shelves. If the library contained a nnmber of books relating to the treatment of horses, and horee celebrities, snch as, "The Life of Flora Temple," "Daring Achievements of American Girl on the American Tnrf," "Occident on a Spree," "Smnggler as a Flyer," and "Dan Voorhees, the Champion Strider," we should conclude at once that our host was a sporting man, and we would prepare onrselves accordingly. If, on the other hand, we fonnd it nnmerously sprinkled with books of a religious character, we would conclnde that the proprietor was a pious gentleman, and we wonld be careful that our greeting should be correspondingly appropriate. Having satisfied ourselves concerniug the mental caliber and general character of the fellow, we would then procesd to iuvestigate the matter of good breeding and neatness, and to do this we wonld examine the order and arrangement of the books npon the shelves, and we would open a few of them to discover the state of preservation in which they were kept. A well worn book is an evidence that it has been consulted; that it is not merely kept for show, and we always like to see the ordinary marks of nse npon a nseful book. The evidence of nse, however, should show more upon tbe leaves inside of the book than upon the back and edges, bnt the manner in which our cabinet makers have heretoforo been in the habit of constnoting book shelvee renders it almost impossible to preserve the backs and edges of books that are mnch handled, in a decent condition. The sharp edges of book shelves havo destroyed more books than all the handling to which the hooks themselves are snbjected for legitimate nses; and this is especially the case with reference to large and heavy books, which are nsnally the most valnable and most costly. When tbe shelf is higher than the level of an ontstretched arm, it is almost impossible to take down a large volnme, or replace it upon the shelf, withont dragging it over the edge of the shelf, and in this way the edges of the cover are mutilated and injnred. We can therefore excnse the gentleman if the covers of his books are ragged, worn and draggled, if his book shelves are of the ordinary old style pattern.

We present herewith, however, the illnstration of an improvement in book shelves which is intended to obviate the difficnlty. It consists, as the reader will perceive, of a roller, mounted in front of the edge of each shelf, so that the edge of the hooke will bear npon and roll over the roller when they are being taken down or replaced. The rollers are covered with a thin film of India rnbber or other elastic material, which gives softness and friction, eo that they will be sure to rotate, and the book will roll easily off or npon the shelf. The rollers also add to the beauty and finish of the shelf, and they can be colored in any desired tint. A person who hae not tried to take down or replace a hook over tbis attachment can realize the satisfaction, and in fact tbe real plessure, which it gives. One of the book cases in our Patent Agency department, on wbich we keep tbe monthly volumes of patents, ie supplied with these rollere, and we actually atate a fact when we assert that we have seen persons stand as long as ten minntes at a time and pull out and push back the volnmes over the rollers, asserting that it was a real pleasure to take down a book; in fact, tbat it would be a pleasant task to pnll down and pnt up hooks all day over them. The assertion was extravagant, bnt we exonsed it becanse, as like as not, they were inventors who had or expected to have cases of their own for our inspection, and were fishing in an underhand manner for a compliment for their own inventions. The rollers, however, merit a complimsnt.

One of the most important uses to which the roller oau be applied, is in connection with the



BOONE'S IMPROVED ROLLER SHELF EDGE.

shelves upon which large books of record are kept. An examination of the shelvee in our City Hall npon which these booke are kept will show that the authorities have been compelled to line and cover the edges of the shelves witb zinc, and even then the edgee of the booke look as though an army of rats had been let loose amongst them. This roller will not only preeerve the hooke but will cause them to move easily into and out of their compartments on the shelvee with but little mnscular exertion. This invention hae been recently patented, through the MINING AND SCIENTIFIC PRESS Patent Agency, by Jno. L. Boone, one of the firm of Dewey & Co. Gilbert & Moore, of 219 Bush street in this city, the well known office and school furnitnre manufactnrers, are the agents to whom all communiostions can bs, addressed.

Comstock Papers.

No. 7.

Brief Skstches of Washoe Pioneers, Continued.

John Osborne, who, as we have already stated, owned one-twelfth of the Ophir and one fourth of the Mexican gronnd, went to Western Utah at an early day, having been engaged in placer mining along Gold osnyon for several years prior to the discovery of the Comstock lode. Being a native of Kentucky, he was known among his companions as "Kentuck," the claim at Gold Hill so named having been oa led after him. He was a large owner in this ae well as in several other valnable locatione besides those above mentioned, and was at one time worth a good deal of money. For his interest in Ophir, eold to Donald Davidson and General Allen, he received a handsome sum, thongh we do not recollect exactly how mnch

Osborne, who was marked by that lack of thrift so chsracteristio of the first settlers on the "Eastern slope," parted with his money freely, and, therefore, as may be well supposed, pretty fast, having been reduced at the time of his death to rather moderate oirenmstances. He died at Silver City, a small hamlet on Gold oanyon, four miles helow the town of Virginia, in 1864, his death having been oansed by a fractnred limb that failed to mend readily, hastened, it is said, by grief arising from an unreciprocated attachment nnwisely cherished for a yonng woman with whom he met a short time before. It may seem improbable to some that one so long separated from refined society, and almost a stranger to female infinences, shonld have been seriously troubled by a feeling of this kind. Bnt it is notorious that this sort of partial exile is apt to render men all the more susceptible to the tender passion, many of these Washoe pioneers, after they had acquirsd some wealth, having given way to this weakness in a remarkable manner. Comstock, within a year after he received his money, was dispoiled of the most of it through the machinations of an artful woman, several of his companions having in like manner been cajoled out of their money, and sometimes into basty and ill-advised wedlock and that not always with women of the most exemplary or deserving kind.

Unhappy Effects of Suddenly Acquirsd Wealth on the Marital Relationship.

In some oases the staid and previously well behaved wives of these financially fortnnate men took it into their heads, upon their hnsbands becoming rich, to plsy an imperious snd overbearing part, persisting in which, they generally succeeded in seonring the larger share of his effects, and in rupturing the marital bonds that had bonnd them together. It was so with poor Berry, whose sponse, (the snpernumerary wife of a Washoe Mormon who had nnsealed and set her adrift,) so soon as she had got fairly wedded, deftly relieved her loving and unsnspecting hnsband of all his spare cash, and then took her departnre for the City of the Saints, leaving him to die poor and deserted. It was so with Wm. McNulty, once a well-to-do merchant in Ohio, afterwards a prosperous business man in California, who went to Washoe in '60, put np a mill and made money, lost some of it, took to drinking, mistreated his wife, who left him, having first secured the fragments of his fortnne, all of which drove the despondent and rnined man to commit snioide, which he did by shooting bimself at the Eagle hotel, in Sacramento, in the year 1865. It was so with poor Joseph Hastings, whose wife left him, perhaps not without canse, and afterwards married J. R. Hardenberg, of San Francisco. Hastings sold ont his interests in Washoe, which consisted of mining grounds, water franchises, arastras, etc., and realized from the same a handsome sum as esrly as 1860. He died a few years after, old and quite poor, his wife, a nephew and some other parties having secured a portion of his wealth, and thus saved it from going as the most of it had already gone, without any resultant benefit to any one.

So also fared Hiram Bacon, once the owner of the famous Bacon claim, now a portion of the Empire-Imperial ground, sitnated at what was long considered the very core of the Gold Hill bonanza. He owned also other valuable gronnd in the vicinity and became at an esrly day, through the sale of these properties, a man of large wealth, after which his evil star arose in the shape of a termagant and ungrateful wife, who, having set herself systematically at work to plunder him, succeeded so well with the job that he was compelled at last to seek relief from his poverty and sufferings in the almshouse at Placerville, where he died a panper only a few years after his unfortnnate marriage. Other examples migbt be oited tending to illnstrate the infelicitons effects of snddenly acquired riches npon that clase of people to which these Washoe pioneers belonged.

In our next paper we will speak of s class of men the very opposite of those we have just been considering, for a few such were to be found in those Washoe silver regions almost from the start.

ALPHA Council, No. 1. Order of Sovereigns of Indnstry, hae been organized in thie city, with Mrs. Winn as Secretary and J. Earl ae President. The object of the society is principally to associate the industrial classee together for co-operation so as to purchase all the necessary artiolee for family consnmption at wholesale prices.

AT the pisciculturnl convention held in the Centennial grounds on Satnrday, California received special commendation from some of the speakers for the extraordinary salmon propagation in her waters.

CORRESPONDENCE.

Alpine County—its Mines and Resources, Past, Present and Future.

[Written for the PRESS by VICTOR HARLAND.—No. 9.

Silver Mountain District.

In presenting to the pnblic the events of a series of years in any one locslity, let those eveuts be of whatsoever nature or description, there sre alwsys within the resch of the writer of such history or progress many items that serve as a basis for the wish thst the existing facts to be set forth could hsve been otherwise. Especially does this feeling pervsde the minds of those who, from a mining stsndpoint of the present day, review the former condition and progress of meritorions works which hsve been forced to an sbsndonment tbrough no fanlt of the enterprise itself; and in presenting to the readers of the PRESS the past history of one of the best and most promising mines of the district, it would most nsturally be of more satisfsction to the writer and to the pnblic, to ssy naught of those most interested in its future development, conld the immense and long continued labors of the compsny in prosecnting the work necessary for permanent operstions on their lode hsve resohed the point which the new organizstion hope to resch ere another yesr shall have psssed awsy. In the description that will follow of this mine, once so prominently before the mining pnblic, the first glimpse thus far shown in these artioles of the stupendous nndertakings of a few individnals that hsve been prosecnted throughout the length and breadth of these mining districts, will appear.

On the northern slope of the mountain ohain that rises upon the south side of the bssin in which is sitnsted the town of Silver Monntain, beginning, ss viewed on the snrfsce, on the south bank of Silver rreek, and forcing their way throngh the porphyritic walls that rise on either side, can be seen the massive oroppinga of the

Mountain Lode.

To the most careless observer this lode throughout its entire length appears of great strength and continuity, and from its prominent appearance it became the center of attraction to all who visited the district at the time of its discovery and earlier development. The mine was located in the earliest days of the district, a home organization was immediately effected, and labor commenced at a point a short distance below the outorop and at an slitude fully 1,000 feet above the town. The lode at this point shows a width of 15 feet, and the short surface tunnel driven at this high altitude through the lode, although being but a superficial opening in the mountain side, demonstrated the fact of tbe existenoe of a trne fissure vein, and also that the ore was of a qnality that wonld readily pay for reduction provided an economical metbod conld be obtained by which the ore could be transported from the mine to a mill.

In Those Early Days

The expense necessary for the transportation of ores and freights was proportionately high, and the oonstruotion of a new road from the town along the monntain-side to this point for the single purpose of transporting the ore that oould be taken from above tbe tnnnel level was deemed too expensive, and the proposition of running

A Long Tunnel

From the base of the mountain to the lode wsa laid before the company and finally accepted as the most practioal and immediate method of developing the mine. The company being, as before stated, of home organization, and composed in greater proportion of poor men, the idea of the erection of hoisting works at the base of the monntain was only for a moment entertained, they deeming the easier mode of extractiug the ore from above the level of the proposed tunnel more advantageous than the more expeusive mauner necessary in raising it from a shaft. It is donbtless, in the light of present events, well that this tnnnel was projected, for the length actually driven proved conclusively that the lode has a stronger dip than at first appears in the upper tunnel, and the distance from a shaft of even but a nominal depth sitnsted at the base of the mountain would be so great that an economical prosecntion of labor in development at the lower levels wonld be totally impracticable. Popular opinion at that time pointed to this tunnel system ss being the most proper method of opening the mines, especially, as in thia case, where an advantageous location is not easily fonnd for the erection of permanent works; therefore, this projeot of a tunnel which, when oompleted, would approximate 2,000 feet in length, met with but little or no opposition from partiea interested. Accordingly a site was seleoted, tbe gronnd broken, and the long and tedious battle with the rocky interior of the mountain commenced. For a period of five or six years

This Formidable Work

Was almost nninterruptedly carried on. The quantity and the qnality of the ore in the upper tunnel snd tbe hope of incressed value and proportions at the lower level when reached proved sn incentive for their lsbors, and never did a compsny organized under similar circumstances more faithfully prosecnte the lsbors thst dsy by day were beccming more tedions and hard to besr. As time passed on and the length of the tnunel gave rise to the belief of the penetrstion of the lode st almost any moment by dsy or night, the efforts to meet the nstural expense of such an undertaking were doubled, and a survey was msde for the purpose of ascertaining as near as possible the distance yet to be rnn before the lode wonld be penetrated by the tunnel. This completed and msde known caused the first actnal aud immediate embsrrassment of the compsny. By close and careful applicstion snd calculation the distance yet to penetrate the solid grsnite barrier wss fonnd to be considerably in excess of that determined upon by a former survey, and as the progress then made in driving the tunnel was neoessarily

Slow and Tedious

Witb snoh a solid, obdurste foe to contend with, it was fesred, snd not without foundation, as the sequel will attest, that the company would he nnable to complete the work, unless sssistsnce from other sonrces could be procured. The tunnel was persistently driven, however, till from a total lsck of funds or meaus at their command, the compsny wss compelled to desist, and for the time, at lesst, abandon the enterprise that wss commenced under snch fsvorsble and anspicious circnmstances. There being bnt one mill in the vicinity capsble of redncing ores even by the compsratively ineffectual process then known, the cost of transportation and reduction debsrred them the privilege of extssoting the ore alresdy on hand in the upper works, and the compsny, now forcedly impecunions, had but little hope of even a partial realizstion of their former wishes regarding the future permanency and vslue of their possessions. The dissdvsntage of location is really the only drawback thst a compsny would have to encounter during a final snd permauent prosecution of the work, but with the improved applianoes of the present dsy which are adapted for this speciea of mining, the greater portion of the difficulties that would heretofore have ensued can be proportionately obviated. The company have a property aggregating abont 2,700 feet in length on the lode, and now, after a rest of seven years, have tsken

Steps fsr a Reorganization,

And removed the office of the company to San Francisco. A high degree of interest seems to be manifested among the stockholders now residing in that city, and efforts are beiug made to resume work at an early day and npon a scale commensurate with their prospects as developed. The reorganization was effected on Sept. 11tb by the election of S. Reinstein as President, and John N. Barber, ex-connty clerk of Alpine county and a man well and favorably known in many places in the State, as secretary. About 10,000 shares of the new issue of stock have been placed in the market as a working capital, and it is now confidently expected that permaneut operations will be inaugurated withiu a mouth and pushed to a successful completion of tbe labors so enthusisstioslly begun so many years ago.

Tybo District.

EDITORS PRESS:—I cannot refrain from giving expression to the surprise that animated me on my entrance to this burg, after an absence of 14 months in the Golden State. Many new and substantial improvements have beeu wrought, not alone in and around the company's worka but in the town, which I fonnd adorned with several brick strnctnres, thus proving, to my mind at least, that the affairs of the

Tybo Consolidated

Company were in a flonrishing condition. When I was lsst here, State Mineralogist Whitehill and Professor W. Frank Stewart, of Virginia City, had visited this place in making their tour of the State, for tbe purpose of collecting samples of ores from the various mining centers for exhibition at Philadelphia. From here both gentlemen took some very fine argentiferous specimens, and Mr. Stewsrt, whose qualifications as a skillful mining expert are well known, unhesitatingly prononnoed the Two G, which forms one of the series of the mines of this company, one of the most promising base metal claims that he had met with during his extended trip through the mining districts of the State. Could that gentleman but see it now, and examine its fourth, fifth and sixth levels, I doubt not but a well defined smile of exultation would overspread his featnres as he contemplated the evidences which bear silent but tangible proof of his judgment as a mineralogist.

When I left here in Juue, 1875, there was not a great deal doing, and tbe sparse population of the place, like the illustrous Micawber, were supinely waiting and watching for some turn of fortune's wheel that would result to their advantage. Now, after, as I said, an absence of somethiug like 14 months, I return to find an almost Aladdin change all round; the inhabitants more than quadrupled; the tiger nightly bearded in his lair by the votaries of fortune, and trade dollars, drawn from the company's well stored coffers, strewn ronnd on the green cloth as thick as the lesves in Valombrosa.

The Business

Of tbe place is more concentrsted than heretofore, owing to the two upper towns being merged into one. I find slso thst the various industrisl pursuits, mining, coal-bnrning, etc., sre in a very healthy condition, and the most inattentive observer csnnot avoid noting the general well-to-do air of prosperity and finsncisl independence that pervades the camp and its energetic people. This, it must be said, is a plesssnt stste of things to either write of or read about. I have traveled mnch throughout Nevads, and have seen snd inspected many of its bossted mining locslities, snd in view of the dullness that I have witnessed elsewhere, it will not be too much for me to say that nowhere, ontside of Virginis City, have I seeu exhibited more resl and solid evideuces of wealth sud comfort thsn there sre existing in this vicinity. I must confess tbat it is very gratifying to me to be sble to note these facts, because they most strongly and conclusively bear testimouy to the fulfillment of my psst predictions regarding the brilliancy of the fntnre which from the first I foresaw wss in store for Tybo. Nature, always liberal, has bestowed no small store of her mineral treasures upon this favored locality. These miues, of whioh the Two G is the mouarch, sfford an irrefrsgible illustrstion of the bountiful resources of the minersl kingdom.

Eastern Nevada

Has alresdy become fsmous both at home and abrosd, on acconnt of the ohsracter and extent of its metsllio productions. Eureks, 100 miles to the north of here, was at one time the *ne plus ultra* of mining oistricts, and without a change hss taken place, it is yet the most importsnt oenter in the esst. The pristine glory of the Richmond and Enreks Consolidated hss not yet depsrted. A new stsr has, however, arisen in the horizon of the grest east, that bids fair to be by-snd-by classed as of the first msgnitude. Tbe growth of Tybo, together with the splendidly developed charaoter of its mines, cannot fail to confonnd those whose skepticism would not sllow them to think that the appsrently barren hills amid whicb this growing camp lies embosomed, contained, down deep beneath their rough exteriors, the rich snd inexhaustible argentiferous deposits which the unflagging energy and enterprise of the above corporation have helped to develop in the channels formed by Nature. And the said oompsny has not only developed but it has extracted, from the Two G fissure, thousands of tona of richest ore, which has been converted into bullion and shipped to your oity to add to its wealtb and greatness. The mines of

Eureka,

With one or two exceptions, have been self-sustaining from the first, and so have the mines of this company, whose immense and expensive outside improvements in bnildings, furnaces, water-tanks, pipes and ditches, coalbins, tramways and a 20-stamp quartz mill, etc., have all been completed without making a demand upon the pockets of stockholders. There are hnt few mining companies in this State that can exhibit a like atate of things, and none at all that can lay claim to the possession of as fine mining and reduction works, both furnsce and mill capacity, as can the company under consideration.

But I find that I have already exceeded my limits and must therefore briug these desultory lines to a close, promising that next week I will give you a full and correct description of both the mines and works of this corporation.

Tybo, Nevada. GOTHAM.

Working Quicksilver Ores.

The following article concerning a new process of working quicksilver ores, proposed by Emil Pellet, was translated from the *Berg und Huettenwesenmaennischen Zeitung*. It was furnished to the PRESS by Mr. Randol, manager of the New Almaden mine:

In the *Revista Minera*, volume XXII, as also in this journal, volnme XXXI, 1872, on 410th and following pages, is mentioned a new process for the reduction of cinuabar ores by Emil Pellet, and on the 309th and following pages of the first meutioned pnblioation, is a review by Ygnacio Gomez Salszar of the results of the trials of said process made in 1869 at the worka of Almaden in Spain, under the direction of the mining inspector Don Jose Monasterio y Correa and wbioh appears in his official report, the statements of which may prove of interest, as no further details about this process have been published since. In volnme XXIX, 1871, of the *Revue Universelle des Mines, etc.* by de Cnyper is, on the 1st and following pages, a communication about the qnicksilver mines of Almaden by Jose Monasterio y Correa, and at the end of it is promised also a description of tbe process employed in Almaden for the rednction of ores, but as this has not appeared as yet, the following remarks of Salszar on the results which were produced by the experimental tests of Pellet's process may find a place here.

According to the statements of Salazar, Pellet asserted that he had discovered a process for which he clsimed the following advantages: 1, No loss of quicksilver contained in the ore; 2, curtailing of the expenses of working the ore, and of fuel; 3, no loas of quioksilver hy vaporization, explosion or imperfection of apparatns; 4, reduction of the ore in the state in which it is mined, wet or dry, in large or smsll pieces; 5, nninterrupted-working throughout the year, regardless of the stste of the atmosphere; 6, low cost of the appsratus and inconsiderable repairs; 7, ssfety of the health of tbe workmen.

These great sdvsntsges of the new process were considered for the works of Almaden of tbe greatest importance, and each one of the advantsges clsimed was regsrded as meriting a reward; heuce the government of Spsin willingly offered opportunities and means to test the new process at the reduction works of Almsden under tbe msnagement of Monasterio and Arciags, who were directed to report upon the results in detsil.

Monasterio asserts in his report, that all conjectures of the inventor of the tested process had proved themselves to be incorrect. Tbe loss of quicksilver, which Pellet had promised to avoid entirely, had been found to be doubled. The cost of reduction hsd been four snd a half times grester than the expenses of the old process, which hsd been used in Almaden over 70 years; and the escape of quicksilver (volstilization) through crscks and in every conceivable manner, hsd csused great losses. Neither in the dry nor in the wet state, neither in small nor in lsrge pieces had they been able to reduce the ore as it had been mined; and after breaking with the hammer the ore had suffered losses in every stste of the atmosphere, in summer and in winter; and also the health of the workmen who were employed for the Pellet process hsd suffered considerable injury.

According to the process, by Pellet, the distillation of the volstile psrts of the ore is effected by mesns of a continnous rossting in plsce of the intermittiug rossting, and the condensation in the atmosphere is replaced by a condensation nuder wster. Sslazar fnrtber asserts that the process of Pellet respecting the two above-menticned devistions from the nsusl process of Almsden had been previonsly tried in Spsin and other countries with unfavorable resnlts. Tbe use of water for the condensstion of meronrisl vspors conld not properly be regsrded as the invention of Pellet, for the use of rsin had been proposed, but rejected, for the attainment of the same object; and the proposed conduction of tbese vapors througb a mass of water of five mi imeters did not promise f vorable resnlts. The application of a cnrrent of air, created by a ventilator placed at the bsse of the fnrnaoe, was neither new nor proper, and in the oase nuder oonsideration did not serve its pnrpose, and the arrangement of the contrivanoe was like many others, whose main part consisted in a system of chambers. Based npon these facts, Salazar believes to be justified in regsrding the process of Pellet as one which, although based upon good principles, througb their misapplicstion formed an aggregation totally unfit for the accomplishment of the desired object.

In accordance with Salazar's assertion, the unfavorable result obtsined of the competitive trial at Almaden cannot be ascribed to the retention of means and resources, as an nnlimited supply of them with the most favorable opportunities for their application had been accorded to Pellet. He was permitted to make a preliminary trial, and to introdnce, for tbe d cisive trial, several important modifications suggested by the resnlts of the prior trial. Pellet's process of redncticn was placed in comparison with the results of a furuace in Idria, which produced less than the older furnace of Bnstamante, and the competitive trial took plaoe in the hot season, which is the most unfavorable season of the year for the Idria furnace. Bills of oosl dust, which are always used in charging the Idria furnace, were omitted in the trial charge, for Pellet did not nse them. This was a disadvantage for the Idria furnace.

Notwithstauding the equality of the charges placed in both furnsces, Pellet protested against the coat of cement with which the interior of the Idria fnrnace was lined. But, to bring about, in this instance also, equality, Pellet's furnace was also liued with a coat of cement. Pellet asserted that the above mentioned coat of oement belonged to his invention and drew from tbis the inference that the nnfavorable difference of the obtained results at tbe trial was owing to this trifle.

Salazar says he would not have mentioned this assertion of Pellet's if Monasterio, in his report, had not spoken in favor of it. Bnt he wonld remark to both that neither the cement nor its applica ion belonged to the invention of Mr. Pellet, and that the cement coating of the furnaces of Almaden had beeu proposed many years previously by a mining engineer of Spain.

Omitting the other critical comments of the report of Monasterio, we shall make the following extrscts from the communication of Salazar, psge 392, etc., and 494 of the *Revista Minera:*

The mind of Pellet was not set at rest by the failure of the trial of his process at Almaden, bnt he gave it another test at Albunol, to which Salazsr had beeu previonsly invited; bnt the invitation was declined for the following reasons: Pellet had offered his process to the Spaoish government in 1867, olaiming for it tbe above meutioned advantsges; he had requested the government to compare the results obtained by his prooess with those obtained hy the process then in nse at Almaden; he had further requested the appointment of a committee of experts, and, in case the committee should report in favor of his process, to grant him a reward, whicb, according to the estimation of Pellet, would have amonnted to 15,000,000 reales.

Regarding the improvement in the process of

Continued on Page 254.

MECHANICAL PROGRESS.

Skill in Engine Firing.

People do not generally give to ths fireman credit for the skill his occupation embraces and demands. We have record of eome experiments made for a prize in an English contest which ere interesting and suggestive. The tests were made with a small motor, but the points involved are of general application. The Royel Agricultural Society of Englend offered prizes for the best driver of n portable engine. The first prize wns £5 and a silver medal, and the second and third prize consisted each of £2 10s and a silver medal. The *Engineer* says: The tests were carried out in the following wey: An eight horse-power agricultural locomotive was provided. The engine was fitted with n friction brake, euch es is nsed by the Royal Agricultural Society, end e counter. The brake was loaded to 22.5 horsepower. The engine wes hended over successively to the different competitore, 21 in number. Each man was supplied with 210 pounds of coal and 8 pounds of wood, and ae much oil and tallow as he required was weighed out to him, the quantities heing carefully noted. He wae then left to fire and drive es he pleased, without interference, except to warn him that he wes running hie engine too fast or too slow. The standard of effioiency was the number of revolutions got out of the engine. Without going into details we may say that nfter five days' work the four best men competed a second time, the result being thnt the first prize waa nwarded to John Watere, who got 13,967 revolutions ort of hie engine; the second prize to J. Snashell, with 13,366 revolutions, and the third prize to J. Gardiner, with 13,258 revolutions. Turning to the log sheets we find the following comments by the judges, Messrs. R. J. Sankey and Thomas Aveling. Againet Waters we have: "Tnbes swept: cylinder lubricated often, and engine oiled; damper closed; reversing lever maintained by a small wedge just hehind the fifth notoh. Coals well broken and wetted; preseure very regnler at 90 to 98 pounde; firing very good, ashes hurned." Very nearly similar entries were made by the judges for the two other prize men, from which it appears that they understood what tbey were about. We may call special attention to the use made of his expansion gear by Waters, who, finding that he could do a little better with the link in one pluce than in another, compensated for the want of sufficiently minute divisious in the sector of the reversing lever by wedging the latter just where he wanted it.

We may be asked wbat all thie amounts to, and what ie proved by the fact that Watere ran off 13,967 revolntions? The actuel running time wae 91 minutes; the mechanical time was 93 minutes, and the coneumption of fuel was 6.45 pounds per hrake horse power per hour. Now it must he borne in mind that none but tolerably good men, men with some reputation as divers, competed. If we turn to the log of the man who did worst during the trisl we ehall see what the difference between good and bed firing and driving comes to. The emallest number of revolutione obtained was 7,943, the running time being 59 minutes only; the mechanical time was just under 53 minutes, and the consumption of fuel was consequently over 11.3 pounds of coal. This is to eay that Gardiner used nearly twice as much coal per horee per hour as Waters. Gardiner'e driving eeeme to have been unsatisfactory throughout. The revereing lever was frequently changed from one notch to another, and the damper wee altered several times; the speed of the engine wae very irregular. We have thus the plainest possible evidence that the saving which can be effected in fuel by a skillful man is a very important item in the economy of engine power.

STARTING REVEESING ENGINES.—At the last meeting of the British science society, a short paper on an "Engine for Starting Large Reversing Engines," illuetrated by a working model, wae read by Mr. A. B. Brown, mechanical engineer, Edinburgh. The principal feature of this engine consisted of a combination of steam and hydraulic cylinders controlled by automatic valve-gear, which enahles the engineer to reverse the largest engines, without eesistance, in a few seconde. This is accomplished by the lever, which opens and closes the steam and hydraulic valves, being hung partly on the revereing lever, and at its other extremity on the weigh-ebaft lever, eo that auy motion given to it and the valves by the engineer in one direction is counteracted by the movement of the weigh-ehaft lever to which the liuks of the marine engine are attacbed. In thie way these links follow the motion of the reversing lever, and are locked fast at any degree of expansion in the quadrant.

A NEW PREVENTIVE FOR SLIPPING.—A European engineer, C. Heinrich, hae invented a new epparatus, inetead of the sand box now in uee, for preventing locomotive wheels from slipping. It cousiete of a narrow tuhe, running from the hot water reeervoir to the drivere, so that a small jet of hot water oan he played upon the traok, thue cleaning and drying the track at the same time, thereby giving the drivere their full power to propel the train. It hae been need with most eatisfactory reeulte on the Motan road, of Reechetza, Hungary.

Extinction of Fire on Board Ships.

At a recent meeting of the chemical section of the Glesgow Philosophical Society, a paper on this subject wae reed by Mr. D. Cargill, Dundee. He referred firet to the ventiletion of ships, and enid: Before cargo is put on board, place plenke along the bottom of the hold to make an open space about one foot squere; lead a three-inch diameter cest-iron pipe from this open space to deck, which can he closed with plug screw flush with deck till wanted; have one of these pipes every 50 feet length of ship. On deck have en ordinary blaet fan about 12 inches diemeter, may he more or lees as reqnired; attnch to thie fan one end of n flexible hose, en ordinary three-inch eenves hose will do; the other end attach to the top of the cast iron pipe. Wben ventilation ie wented work the fen by hand, wind or eteam power, which will blow through the ship any quentity of eir to purify the gee arising from coal cargo, or expel any sweat arising from other cargoes. As to the meene of preventing firee by counteracting the ignitable and inflammable tendency of gas-emitting cergoes, Mr. Cargill said: For this purpose an earthenware, fireclay or metel veseel, or even an empty cnsk, ie pleced upon the deck, or at otber convenient parts of the ship, into which a quantity of broken chalk, marble, hicerbonate of seda, or other carbonate ie plnced. The vessel is formed with two openings or necks, but nny enitable form of vessel may he employed. To one neck a flexible pipe, composed of gntta percha or other suitable material, is attached and secured to a vertical pipe. Into the other neck or opening of the vessel a eyphon pipe, formed with a funnel or mouth at its outer end, is inserted; and it, together with the flexible pipe, is luted with putty, or otherwise fixed in a manuer to prevent escape of gas from the veesel. Through the syphou pipe n mixture of eulphuric or muriatic acid and water, acid salt, or dry acid dissolved in water, is poured into the vessel, which mixture, acting on the chalk or other carbonates, liberates carhouic acid gae, which is conducted through the flexible pipe into one of the vertical pipee, and is thereby conducted to the bottom of the ship'e hold, where, combining or commingling with the gases arising from the coal, or other gaseous or inflammable cargoes, the carbonic acid ghe destroys the combustible tendency.

BOILER EXPLOSIONS.—The Manchester Steam Users' Association (established by the late Sir W. Fairbairn, to prevent the sacrifice of humau life from steam hoiler explosione) has published a etatement, showing that, in ten years euded in 1874, there were 534 explosions, which killed 617 persons and injured 997 others; an average for each year of 53 explosions, killing 62 persons and injuring 99. During 1875 there were 45 explosions, killing 67 persons and injuring 96. The Secretary of the association, Mr. Tonge, writes: "This sacrifice of humen life continues year after year. It is perfectly gratuitous. There is nothing in the nature of steam to cause it. It arises from the use, in most cases, of bed hoilers, sometimes purchaeed second-hand, and put to uses for which they are quite unfit, sometimes bought at so stiogy a price that the maker cannot put in good material or good workmanship. In other cases it arises from working boilere till long after they are worn out, and frequently so reduced that the platee are no tbicker in places than an old sixpence. The association is desirous of promoting a searohing investigation in the event of every explosion, so that the truth may be arrived at and published, instead of letting negligent eteam ueers get off under a verdict of 'accidental death.'"

WHAT THE CENTENNIAL IS DOING.—Every day brings to our notice freeh indications of the great adventagee which the International Expositiou must almost immediately and from time to time bring to city and couutry. The Philadelphia *Press* says: 'We have just seen a letter from a large house in Geneva, heving extensive connections throughout Switzerland, making inquiriee respecting the manufacture of hosiery, of which very favorable and gratifyiug accounts have been eent home by the Swise experts in attendance upon the exhibition. Thie house was led to believe that American goods in the hosiery line could be more profitably introduced iuto Switzerland and the adjoining states than similar goods of European manufacture, and they desired full information as to dealere' prices, terme of sale, etc., with a view of extensive operetions. From Naples, also, we have seen a communication inquiring as to American sewing machines. These are but indications of the widespread interest in American manufaotures which has been awekened, and which cannot fail to be of immense practical advantage to all our industries.

WOODEN WALL PAPER.—The machinery for the manufacture of wood paper hangiogs has been so perfected that an inch of white maple or other fine grained wood can be slit ao ae to furnish 200 thin leavee, having the surface and grain of the wood. These leaves are laid upon a peper backing, and, thus coustituted, may be fastened to the wall the same ae common wall paper. A room thue furnished presente the appearance of a paneled apartment, since all the surface visible is that of the actual wood. With smoothed and poliehed woods of a coarser or more open grain, the number of leavee or veneers to the inch ie 125. The machine which producee these leaves ie a marvel of mechanical ingenuity and skill.

SCIENTIFIC PROGRESS.

Electric Lights at Sea.

At the time two rival lights were being tested on the clock tower at Westminster, it was asserted that the wonderfully brilliant electric light would, by-and-by, come to be very generally adopted on shipboard, not merely as a substitute for the lamps now commonly in use, but ae a meane of lighting a vessel on her ocean pethway hy night. It wae thought possible to throw a glere of light from the mesthead so far in advence of the veseel, that rocks, floeting icebergs and other dengere ehead might he descried in time to avoid collision. The London *Globe* seye that the French Trensatlantic company's vessel, *Amerique*, hes been trying the experiment with an apparatus similar, we believe, to thet which wes shown on the clock tower, and the success of it is said to have beeu so decided thet the compeny hes taken steps to provide other vessels helonging to them with the seme illumination. This experimental triel hes been made in the course of a run from Havre to New York and back, end the light has been found of immense service in many ways. As described in the *Revue Industrielle*, the apparatue consists mainly of a Gramme machine, a portable lamp and a signal light placed in the upper part of a sheet-iron turret. The Gramme megneto-electric machine has a power of 200 carrel jets, while the lamp is fitted with prismatic lenses, and is capable of throwing a glare of brilliant white light over an aro of 225 degrees. The lamp on board the *Amerique* wae 33 feet above the water, and at this hight it was thought to have a poesible range of ten geographical miles for an observer etationed 20 feet above the water. Not only would euch a range, or anything approaching it, tend greetly to reduce the rieks of collision, but the power ful illumination was found available for loading or unloading operations, and was useful in guiding the vessel in or out of port, at night. As regards the movable lamp, a very important use wae found for that. By means of a cone of sheet-iron placed over the light, with the broad base of the cone nppermost, a flood of light wae thrown on the *Amerique's* topgallant sails, so that these might be seen hy other vessels a long distance off, even apart from the signal light. It is further added that the whole apparatus is by no meane expensive, is easily managed, but little liable to get out of order, and occupies little room.

INFLUENCE OF THE SUN'S HEAT.—Prof. J. D. Whitney, in the *American Naturalist*, describes the way in which the sun accomplishes the evaporation of great bodiee of water ae follows: The sun's heat is notoriously the source of all climatee, and changes in the amount of heat rsdiated from the sun are now regarded aa causing the changes in terreetrial weather. It is therefore reasonable to ascribe our drying up, since it requires ages for its completion, to a change in the solar cause requiring also a long cycle for its fulfillment, provided that astronomy gives us proof of any sucb change. And astronomy does tell us of two such cycles; one in the obliquity of the elliptio, and one in the perihelion distnnce of the earth from the sun, both oycles being results of planetary perturbations of the earth's orbit. The effect of the second of theee cyclee is too abetruse to explain here; the first ie simpler. As the angle between the plane of the earth's equator and that of her orbit diminiehee, the limite of the torrid zone also diminish, inasmuch es that zoue is bounded by the tropica which are determined by the angle in questiou. The region, then, over which the sun is occasionally vertical is being narrowed. An obvious result of this narrowiug would seem to be an intensificatiou of the equatorial pbenomena of trade-winde, heat and rainfall within the torrid zone, and a correeponding loss of heat and of precipitation in the extra-tropical zones.

REDISCOVERY OF A LOST PLANET.—The astronomers of Europe, eays the *Polytechnic*, are just now excited by the re-discovery of Leverrier'e planet, Vulcan. Some twenty years ago the great French astronomer announced that certain perturbatione in the orbit of Mercury could only be accounted for by the exietence of another planet still nearer the eun; even as the perturbations of Saturn had enabled him to discover the planet Neptune. Within three yeare after Leverrier's announcement, a French observer, Dr. Lescarbault, detected Vulcan in his trensit across the eun'e disk; bnt inasmuch he has not been seen since then, most savana have hegun to doubt whether he was ever seen at all. But the lateet Parisian journals inform us that two eminent astronomers at the observatory in that city—M. Porro and M. Wolf, of Zurich—heve just found Vulcan duriug hie transit ae before. It is not stated whether their observations were sufficient for the preciee calculation of the elemente of the planet. Keppler'e law, however, would reduce the time of Vulcan's revolntion around the sun to about a month. Thie youngest of the planets muet swim in a eea of almoet unimaginable light and heat, and be uninhabitable by any form of life known to us.

MR. POGSON, the Government astronomer of Madrae, carries hie love of hie science to such a pitch that he hae his children christened in accordance with the names of the chief celestial bodies which he from time to time discovers.

The Growth of the World.

Prof. C. A. Young, the well knowu astronomer of Dertmouth college, has written for the *Journal of Chemistry* an estimate of the growth of the world from the fall of meteorites. We meke the following extract:

Since meteoric metter is continually falling npon the eerth, she must of course he growing larger, end the daily number of meteore ie so immense that it would be netural to suppose that the increase might be quite appreciehle in a few centuries. It ie not so, however; the surface of the earth is so enormous, compared with the quantity of meteoric metter, thet, even on the most favoreble hypothesis, her diemeter would grow only about an inch in five hundred million yeers by eccessions of this kind.

A few figuree will meke this clear.

As to the number of visible meteors there is a substantiel egreement emong nuthorities. The estimete of Prof. Newton is ae lerge ae that of any one, I believe, nnd he puts it at 7,500,000 per diem, which number we will use.

As to their averege weigbt there is more difference of opinion. Prohehly, however, the moat careful and best founded investigation is that of Prof. Harkness, published iu his report upon obeervations of the November meteore of 1866, and hie conclusion is thet "the mase of ordinary shooting stara does not differ greatly from *one grain*." Prof. Newcomb appears also to concur in this estimate. There ere reaeons which it would take too long to discuss, for thinking that this value is likely to he somewhat too small; but on the other hand it is almost absolutely certain that the average mess cannot be as greet as one-fourth of an ounce. To he on the eafe side, we will assume 100 greins as the mean weight of the visible shooting stare.

Remembering that the pound ie 7,000 grains, we shnll then find nearly 107,000 pounds, or about 50 tons, for the total weight of one day's supply of shooting stars. An allowance must also he made for the meteors too small to be visible (which are known by telescopic observations to he very numerous), and for the matter brought down by aerolites. If we double the quantity stated above we shall certainly he abundantly liberal, and this will give us 214,000 pounds a day, or about 78,164,000 pounds per year, as the earth's rate of growth *in weight*.

Her increase of *bulk* depends upon the density of the meteoric matter, and probably this density does not differ much from that of ordinary soil, or nearly three timee that of water. If so, each cnbic foot would weigh about 187½ pounds, and the annual meteoric accession to the bulk of the earth would be not far from 417,000 cubic feet. A cube about 75 feet on each eide would he a little larger. It would take more than four million euch to make a pile ae large as Mount Washington. Now, since the surface of the eerth is about 5.484 millions of millions of square feet, it follows that the annual supply of meteoric metter, if spread uniformly, would form a layer whose thickness would be only 1-13,155,000,000 of a foot, or very nearly 1-1,100,000,000 of an inch.

In other words, even on euch extravagantly favorable hypothesee ae we heve assumed, the formation of a eheet of meteoric matter covering the earth to a depth of one inch would require a period of eleven hundred millions of yeare.

If we suppose meteoric matter to have been just as abundant in space as now since the beginning of time, and that the velocity of the earth's orbital motion has remained unchanged, and that the effects of her atmoephere and of gradual shrinkage under the action of gravity can be neglected, then it can be shown by an easy couree of reasoning, which would, however, hardly suit these columns, that her diameter must have grown during her whole existence at the seme uniform rate as now, and we find that to build her up to her present dimensione by euch a process of aggregation must have teken a period of at least twenty-seven and a half millions of millione of years.

It is not intended to assert, however, that the earth was really formed in this way, and even if it was, the above estimate is of little value except as indicating the order of magnitude involved, since there ie no certainty whatever—not even a probability—that in tbe early atages of the formation of the planetary system circumstances nearly enough resembled the present to warrant any conclusion. Nor must it be forgotten that the more probable estimatee of Harkness and others as to the weight of meteors would lengthen all the periods of time mentioned from ten to one hundred fold; we have given the smallest valuea possible.

THE PRESSURE OF SUNLIGHT.—Prof. Clerk-Maxwell says: The meen energy in one cubic foot of sunlight is about 0.0000000882 of a foot-pound, and the mean pressure on a square foot ie 0.0000000882 of a pound weight. A flat body exposed to ennlight would experience thie preeeure on ite illuminated side only, and would therefore be repelled from the eide upon which the light falls. Calculated out, this gives the preseure of sunlight equal to about two and a half pounds per square mile. Between the two and a half pounds deduced from calculation and the 57 tone obtained from experiment the difference ie great, bnt no greater than ie otten the caee between theory and experiment.

Mining Share Market.

The stock market has for some time been under the weather. Without any appreciable cause securities have been steadily declining, scarcely a glimmer of a reaction occurring to mar the disagreeable monotony prevailing. What is known as the "outside" public will never buy at low figures, although in times of excitement and inflated prices this element is only too anxious to get in. It therefore becomes necessary for some strong power to lift the market bodily until a decade of values is established which will prove sufficiently tempting. The news from the Comstock is encouraging, without any important or new developments being announced. The bear canards have been successively exploded, and the forthcoming regular dividends of the bonanza mines are the best answer to the reports spread about the condition of these mines, while the water scare has evaporated under the steady strokes of the Savage and Hale & Norcross pumps. One of the features of the market has been the eccentric movement in Eureka Consolidated, presumably under election influences, and this has caused the stock to become for a time a favorite gamble. Other outside stocks have sympathized in the general decline. Altogether, the week has been anything but a satisfactory one, and all, for there are no hears now, are looking anxiously for signs of improvement. The stock which is now coming upon the market is sold under pressure, and not for short account. Brokers have been very cautious of late and have weeded out most of the elements of insecurity by keeping a sharp lookout for shaky customers, and the market is now sufficiently stable to remove all apprehension of a serious panic.

Two thousand one hundred Californians have been registered at the California building from June 15th to October 1st.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior in proximity to the mines mentioned.

California.

ALPINE.

I. X. L. MILL.—Alpine *Chronicle*, Sept. 30th: The whole of the machinery for this mill, with the exception of that en route, will leave San Francisco on Thursday next. The mechanics for the erection of the buildings arrived yesterday, and are pushing their work with great energy. Thirty-five men are engaged about the place.

AMADOR.

MINING IN VOLCANO.—Amador *Dispatch*, Oct. 7: We understand that another company has been formed for the purpose of deep gravel mining at Volcano, and that the work of running a tunnel into the mines has been commenced. The tunnel is begun down Sutter creek, about 1,000 feet below town, and is expected to strike the mines in the basin some 30 or 40 feet beneath the surface. This is the second company prosecuting this kind of work at Volcano. It will cost thousands of dollars to develop these mines, but when they are developed there is little doubt but that they will yield their ten-fold rewards to their owners. Volcano stands a fair show to again see the flush times of '49.

THE MONTERICHARD MINE.—Amador *Ledger*, Oct. 7: It is pleasing to be able to state that this mine—the only one now being worked which is tributary to Jackson—is in a prosperous condition. A whim has just been erected on the property, and commenced hoisting rock on Friday of last week. The shaft is now down 80 feet; the ledge at the bottom showing four feet in width. The character of the rock continues to improve. It is estimated that the ore now being extracted will run at least $20 to the ton. Three men are engaged in stopiag. On Monday sinking operations will be resumed, when the working force will be increased to 21 hands. The intention is to sink 100 feet deeper before the winter sets in, and if the ledge at that depth is found to hold its own, a quartz mill will be erected close to the mine. Altogether the Monterichard must be classed among the most promising mines in the county. It has paid its way from the very start, and considering the depth attained, we do not know of another claim that shows so well. We understand that the property has been incorporated recently in 32,000 shares, at $3 per share. Persons having spare cash could not, perhaps, find a more desirable investment than the purchase of some of this stock. The neighborhood in which this mine is located seems to be rich in mineral. A great many claims have been taken up, some of the ledges surpassing the Monterichard in size and richness. The development of the Monterichard into a permanent paying mine would have the effect of starting up all these dormant claims.

ANOTHER DRYTOWN MINING VENTURA.—From present indications it seems probable that the neighborhood of Drytown is destined to be as thoroughly prospected for quartz as any part of the State. In addition to the many claims we have noticed of late, O. Dickerson and seven others have taken up a claim close to and parallel with the Crown Point and Bonanza mines. They have put two men to work, and have sunk a depth of 15 feet, developing a ledge 2½ feet wide, apparently of high grade ore. The rock has been tested, and averages well. It is the intention to incorporate at an early date, under the name of the Drytown mining company.

PILFERING GOLD.—Stealing gold used to be a frequent occurrence years back by the miners engaged in the Amador Consolidated mine, of Sutter Creek. The rock was so rich, the free gold being visible throughout, that the employees were unable to resist the temptation to try and get away with some of the richest specimens they met with in their work. Latterly, however, little has been heard of this species of dishonesty. Within the last few months the ore has rivaled in golden wealth the days of yore, and the inducement to steal, it is rumored, has been more than the moral courage of some of the workmen could withstand. The utmost precaution is taken by the company to guard against the possibility of loss by dishonest workmen, but of course some will resort to expedients to avoid detection in theft. One man was discharged on Saturday morning last, it is commonly reported, because of being suspected of taking specimens from the mine.

CALAVERAS.

RICH ROCK.—Calaveras *Chronicle*, Oct. 7: We have been shown some specimens of rich quartz from Potter & Co.'s mine, at Mosquito. We are informed that the ledge is a wide one, and if the rock shown us was an average sample it is the richest thing in the country.

LAMPHEAR MINE.—Everything continues favorable at the Lamphear mine. Sinking the shaft and running the north level progresses rapidly, and the mill is kept running day and night.

COLUSA.

THE BUCKEYE.—Colusa *Sun*, Sept. 30: We are very glad to hear that the shaft recently sunk on the Buckeye ground has at last reached the ore bed. The shaft is 200 feet deep, but it is only 175 down to a very rich bed of ore. The face of the tunnel run from the shaft is 12 feet, and shows a cinnabar of the richest quality all the way across. This mine has been one of the best managed in the State, and, until a cave in the tunnel some months ago, was turning out a large amount of quicksilver, at a profit. We may now expect to see them come in with between 100 and 200 flasks a month.

EL DORADO.

ST. LAWRENCE.—*Mountain Democrat*, Oct. 7: Geo. M. Lederer, of No. 2,628 Battery street, San Francisco, President of the St. Lawrence mine, was up here last week, and went over to take a squint at the big hosanna lately discovered in the St. Lawrence, wishing to "see it with his own eyes," as the saying goes. And he went down to the 800-ft level, and did see with his own eyes far more than had been promised or expected. With his own hands he picked and gadded from the ledge, in a place where it was fully four and a half feet thick, one chunk of ore weighing about 30 pounds, which showed on its surface gold to fully the amount of $100. Mr. Lederer is more than satisfied with what he saw in the St. Lawrence.

ROBINSON.—El Dorado *Republican*, Oct. 5: The Robinson mine, at Prospect Flat, has the finest bed of gravel developed that it has ever yet had, and the mill is turning out the precious metal in highly satisfactory quantities.

INYO.

LOCAL NEWS.—Coso *Mining News*, Oct. 7: We have the pleasure this week of presenting our readers with a report of our principal mines, written by E. E. Crossman, one of the most thorough practical and theoretical mining experts on the coast. First the Modoc mines: The Confidence mine is the most valuable of their several properties. There are about 2,000 tons of high-grade ore on the dump, with thousands in sight as reserve. My assays, taken carefully, run high in both lead and silver, and are of a character, with proper fluxes and worked understandingly, to guarantee big results—high-grade bullion and dividends close at hand. Lookout, a fissure on the line, filled with boulders and fragments of a high-grade argentiferous galena, promises a brilliant future from the few levels and winzes that have been sunk. Hundreds of tons have been extracted, assuring many hundreds of tons more as reserves. The Modoc shows a blanket of high-grade silver-lead ore. Its extent is to be proved. The plant is complete in all its parts. The 60-ton furnaces are ready to start up. The company have excellent boarding houses, blacksmith shops, etc., which are perfect in all their appointments. The Defiance, located near Darwin, I consider to be the "mother lode" of your district. The vein is a true fissure, coursing northerly and southerly, and lying between two dissimilar formations, partaking in some respects of the character of a contact deposit, but as it occasionally cuts the formation, I class it a true fissure. This property consists of four several veins running parallel to each other and but short distances apart. Distinctly defined upon the surface, heavy croppings, traceable for five miles, and the underground workings, at a depth of 150 feet, show conclusively their character. By measurement I am satisfied that the four several veins are approximating, and will form, at no great depth, a veritable Comstock, containing kidneys and chambers of high-grade argentiferous ores. The improvements, steam hoisting works, inclines, etc., are planned with good judgment for future development and workings, but, unfortunately for the success of the mine, the owners of the property were too anxious to realize in the immediate future, and killed the goose that laid the golden egg by building extensive smelting works and other improvements before their mine was properly opened and in shape to supply the ore demanded, and thereby incurring a heavy liability that the product of the mine could not stand. A reasonable amount of capital—say $50,000—would put this mine on a dividend paying basis. The New Coso, I will simply say has merits which, like good wine, requires no bush. I carefully examined the mine and consider it quite equal to Meadow Valley in its palmy days. Ores high grade, a true fissure vein and improving rapidly as depth is attained. A bright future for New Coso. The Emigrant mine is a very interesting piece of property, and I should have been glad to have spent a longer time there.

MR. VERNON DISTRICT.—J. R. Frink, who is interested in the Emigrant company's mines, at Lee district, is also interested in mines at Mt. Vernon, San Diego county, near the Colorado river. He informs us that he has got the foundation for a five-stamp mill built, and the machinery for same is at the terminus of the railroad, waiting transportation to the mines. The mines are gold bearing, the ore of high grade. The mine is looking well, although but little work has been done upon it. Barney Lee, the discoverer of Lee district, is interested with Mr. Frink. It is believed to be a valuable property.

LOS ANGELES.

FINE SPECIMENS.—Los Angeles *Express*, Oct. 7: Mr. Richard Duryea yesterday exhibited to us some fine specimens of gold-bearing ore from Bear valley. From a piece of this ore, weighing scarcely three ounces, he pounded out upwards of a dollar's worth of gold, of a very fine grade, in one of Dr. Heinzeman's mortars. It speaks well for the prospects of that district if there is much of that kind of ore to be found there.

MONO.

BENTON MINES.—Cor. Inyo *Independent*, Sept. 30: In my last communication I promised to give you more of a detailed account of matters and things in this vicinity, especially in relation to the mines. Our mineral interests are looking much better than at any time heretofore, and the prospects for the prosperity of Benton were never so flattering as at the present time. Water at the mines has hitherto been an enormously expensive item, as it was all drawn on wagons from town. But fortune has smiled on the Comanche M. & M. Co.; at last they have struck water in the bottom of the shaft in quantity quite sufficient to supply the hoisting works. The Comanche makes regular shipments of bullion, and declares her dividends monthly. A contract for sinking a shaft on the Blind Spring mine is completed to the depth of 150 feet, and Superintendent Howell is talking of putting up a small hoisting engine, sufficient in power to hoist 1,000 feet. The contractors, Messrs. Louder & King, did the mining. The mines at the Yellow Jacket, seven miles south of Benton, are assuming quite a conspicuous place in the history of the mines in this vicinity. John Tregembo has opened up in the Tower mine a vein of the metallic substance about two feet thick, which assays up in the thousands. Messrs. Tregembo & Thomas, who purchased the Illinois mine last spring, have worked manfully upon it ever since. In the matter of dollars and cents their accomplishment thus far has not amounted to much, but the preparatory work has been immense. A depth of 75 feet has been reached, and there is not a mine or a mining piece of workmanship in the State of California that is any more deserving of credit to the workmen than that of Messrs. Tregembo & Thomas in the Illinois mine at Yellow Jacket. The Indian Queen mill and mine has started up, under the superintendency of Mr. Dudley Hoyt, and that he is equal to the emergency is established by his regular shipment of the usual seven bars per week. This morning the steamer put out loaded down by the guards with bullion. The Diana mine is not panning out as some might expect, but on the other hand it is paying out for improvements now being made, after the completion of which it is thought the owners will begin to realize dividends. A mine known as the "Careless Tom" was incorporated a short time ago, with a capital stock of $5,000,000. It is the south extension of the Diana, and there is no doubt but that the Careless Tom will prove as good as either the Diana or the Kerrick.

NEVADA.

NEW ENTERPRISE.—*Foothill Tidings*, Oct. 7: A new mining enterprise has been started a short distance below the old Allison Ranch mine, on what is supposed to be an extension of the Carlhoo ledge. The owners have been quietly working for some time. They have a shaft down 18 or 20 feet, and in running a drift therefrom on Friday morning the miners cut into a fine ledge which looks well. The owners are N. Dodsworth, Geo. Johnston, T. W. McFate, Wm. McFate, M. Roach and others, who are, we understand, feeling well over the discovery.

THE Orleans mine is turning out very fine ore. A few days ago a crushing of 19 loads was put through the mill and the yield was 278 ounces of gold, worth about $5,000. The ore was from the old Hueston Hill mine.

INKERMAN.—Some parties are taking out rock "on tribute" from this old mine, and we are glad to learn the prospects are good.

PLACER.

MINING ITEMS.—Dutch Flat *Forum*, Oct. 5: The work of cleaning ditches, repairing flumes and fitting up the various claims for the approaching season is being carried on with vigor. The Baker claim already shows that the superintendent means business. The shaft leading down to the grade of the Yankee tunnel is completed. An incline therefrom along the bedrock to the rim is being run. A string of pipe is laid ready for water. A blacksmith shop is being built. The Yankee derrick is being removed to this claim, and in fact everything is being prepared for early washing. The Yankee tunnel will reach a point opposite the Baker shaft this week, there then remains but the running of the branch to complete the work. This tunnel was driven 181 feet last month, at a cost of $23.41 per foot. The Southern Cross and Polar Star claims are idle at present, pending the repairs on the South Yuba ditch, and all the men were paid off on Saturday night. In the Franklin claim the superintendent is taking time by the forelock, by driving the main tunnel ahead, so as not to be delayed while washing. He is also constructing a water power derrick of the most improved style, so as to hoist the large boulders out of the pit instead of blasting and sledging them. At Gold Run the claim of the Gold Run H. M. Co., limited, is being prepared for early washing. An incline leading from the tunnel to the surface of the gravel is being run. Powder drifts are being driven under the banks, so as to be in readiness to use when desired. The Indiana Hill claim is also in a state of activity. Powder drifts are being run under the banks and a deep, open rock cut, for the ground sluice to convey the loosened gravel to the incline, is being blasted out of solid rock. The Illinois or Midas claim, owned by the Miners' ditch company, is being rigged for washing the approaching season. A short bedrock tunnel is being run, so as to wash the gravel to the rim rock. The gravel in the Bailey claim adjoining was quite rich, and it is reasonable to suppose that this piece of ground will pay well.

GREEN VALLEY MINING ITEMS.—The Green Valley mining company are still busy sinking. The shaft is up the old channel is down 63 feet. It has passed through the quicksand, and is now about three feet in gravel, which prospects well in fine gold. The shaft in the hill is down 50 feet, among large boulders, and is making slow progress. The tunnel of the Oppel is completed, and washing the top ground will commence in a few days. Norvey & Co. are making good headway running their tunnel, also in preparing for the erection of a cement mill. The Hidden Hill and other companies are busy, making preperations for winter.

BEAR RIVER MINES.—The Centennial claim, worked by Messrs. Bailew and Crisman, has commenced washing gravel that insures good pay. At the Richie mine they had the misfortune to break the incline rope, which will have to be replaced by a new one, causing a few days' delay. The Bartlett claim, after running a tunnel 600 feet, have struck a channel which prospects well. They have commenced washing. At the Whipple claim they are still busy drifting, but without any success as yet.

THE claim owned by Ross & Ford, at Euchre bar, on the North fork of the American river, has been steadily worked since last winter. They employ 15 men and use 500 inches of water. Good dividends have been paid during the year. This claim has been worked by the owners for a number of years, and is likely to be a good piece of property for some time to come.

YANKEE JIMS.—The miners here are working with a will to get their claims in shape for operations when the water comes, and will no doubt all be in readiness. The drift claims are doing well. The Sebastopol, near town, is paying about $7 to the hand per day, and the Centennial, half a mile from here, is doing still better, averaging $10 per day to the pick. The owners are in good spirits and are making extensive and permanent improvements. They have built an engine house, a fine blacksmith shop, a machine shop, superintendent's office and a boarding house, all new and substantial, and are now building a wood shed, 36x100 feet, and grading the site for their crushing mill. Everything runs smoothly under the management of the superintendent, John Hensley, a practical miner and a gentleman of the old school.

LITTLE YORK MINES.—As the water is turned out of the ditches, with a view to clean and repair them, the only work being done in the mines at present is the running of powder drifts. As soon as the ditches are repaired, water will be turned on at the Empire mine. The other claims will not resume washing until after the winter rains set in.

SAN BENITO.

READY FOR OPERATIONS.—Hollister *Enterprise*, Oct 7: One of the new furnaces at the Stayton mines is almost completed, and will be ready to operate next week. Work on the other furnaces is being pushed along as rapidly as possible. A rich and extensive strike of first-class metal was struck in one of the mines located near the furnaces a few days ago, exceeding anything yet developed in the mineral line in this section of the country. The owners are much elated over the prospects and believe, as we do, that they have the biggest thing in the shape of mines in the State. They will commence shipping metal about the 15th inst.

QUICKSILVER MINING.—The prospect for the successful mining of quicksilver in this section seems now to be very bright. As developments in several localities have disclosed the existence of paying bodies of ore, preparations are being made in some of the mines for work on a far more extensive scale than has been the custom heretofore. The new proprietors of the Stayton mines are pushing ahead their furnaces as fast as possible, and will in a short time be ready to turn out metal in large quantities. This company are also preparing for the reduction of antimony, of which ore they have a great deal in nearly all their mines, some of it being of the highest grade and very best quality. M. Cody & Co. in the Picacho district, we learn will also increase their working facilities this fall, and judging from some samples of the ore sent down the other day, we may look for large shipments of the metal from that quarter. We made mention of an unprecedented rich strike in these mines a couple of weeks ago, and we are informed that the ledge grows better every day, and is clearly a permanent vein. The Consolidated Wonder mines show excellent prospects and it is the intention of the owners to work them up to their fullest capacity this fall and winter. A strike was made a short time since in one of the Consolidated Ralston claims lying southwest of the Stayton mines, which is said to be immense. We have seen some of the surface ore, which shows good sign of metal. The ledge containing it is 20 feet wide and traceable for a long distance. Old and experienced miners seem to have much confidence in this discovery. A number of other claims, mostly north of the Consolidated Wonder, have been worked considerably during the summer and are looking well.

TRINITY.

RICH QUARTZ.—Trinity *Journal*, Oct. 7: A few weeks ago we made mention of a new discovery in quartz on Dead wood gulch, above Lewiston, by Muncey & Belleau, who were then erecting an arastra at the mine. Since then they have crushed two tons of rock, from which they got over $800, and Mr. Muncey is well satisfied that if they had cleaned the bed of the arastra thoroughly at least $200 more would have been secured. They are now down on the lode to the depth of 30 feet and it is six feet in width. Specimens of the rock brought to town are rich in gold, much of which is visible to the naked eye. Four hundred dollars to the ton is certainly a good yield, particularly when obtained by the crude process of an arastra, whereby a large percentage of the gold is lost that would be saved by a regular milling process.

GOOD PROSPECT.—News of a rich strike in the Trinity quicksilver mine reached here last week, and Hon. W. J. Tinnin and Mr. J. W. Smiley have since visited the mine for the purpose of investigation. They report a seam of considerable width impregnated with rich cinnabar, and brought with them some specimens that look remarkably well. The discovery was made in the lower tunnel which is now being run, and is not within 40 feet of the deposit found in the upper tunnel last year. Indications now are that the Trinity company will open a mine equal in richness to either the Altoona or Boston, and another season will find them producing quicksilver in large quantities.

TULARE.

DISCOVERY.—Tulare *Times*, Oct. 7: Dr. Clark and C. M. Tubbs, Esq., have just returned from the mountains at the head of Kings river, where they secured some of the rarest and richest specimens of ore we have yet seen. The specimens can be seen at Kirkland's real estate office. There is some talk of organizing a joint stock company for the purpose of immediately developing the mine. This is a rare opportunity for capitalists to invest with good results.

Nevada.

WHITE PINE DISTRICT.

ARRIVED.—White Pine *News*, Oct. 3: The machinery and drills for the Eberhardt tunnel, through Treasure hill, have arrived and are being set up. At the present time the tunnel is completed to a distance of 200 feet, which has been accomplished by two shifts of men since its commencement. When the machinery and drills are set in motion, it is thought that not less than from five to seven feet of tunnel will be made every 24 hours. We are informed that very favorable indications for veins of ore have already been struck in the tunnel, in the way of a number of feeders that probably attach to some mine. The company are also sinking an incline shaft, which has now attained a depth of 342 feet, and the indications are said to be very encouraging for striking ore.

CLEAN-UP.—The Eberhardt & Aurora company's mill closed down last Saturday night for a clean-up and repairs. The run lasted 36 days, during which time the engine stopped only 30 minutes, which was for needed repairs to the machinery. There is no better 30-stamp mill in the State, and there is no men in the country who can do more or better work with a mill than Perley Rowell, the company's millman.

EUREKA DISTRICT.

MATAMORAS MINE.—Eureka *Sentinel*, Oct. 6: Messrs. Steele & Sturgis, of the Chicago company that owns the Matamorae mine, have gone to Chicago to meet the other members of the company and make arrangements for the thorough working of the mine. At present there is no means of getting ore down from the mine except by pack mules; but it is the intention to build either a road or a tramway, most probable the latter, when ore can be brought down cheaply and conveniently. The furnace is now shut down for want of ore, but the run which was recently made had demonstrated its entire practicability and proved it a success to the satisfaction of Captain Taylor, the inventor, and other gentlemen interested. The mine is now in charge of Captain T. J. Taylor, who has a force of men at work opening and getting it in condition for active operations in the way of extracting ore. The ore body shows up well and promises to yield largely when everything is fairly under way, and everything indicates that the Matamoras company has a first-class mine.

REESE RIVER DISTRICT.

MANHATTAN. — *Reese River Reveille*, Oct. 6: As an evidence that the mines of the Manhattan company are now producing ores of extraordinary richness, we will state that the average assay of ores worked at the Manhattan mill, from the Panamint vein, during the past week, was $383.15; and of the ores from the Frost shaft, $114.12. Are there any other mines in the State that can show so high an average grade of ores? If there are we do not know it; and the best of it is that these ores are not taken from small bunches, but from regularly defined fissure veins, carrying extensive chimneys. The results mentioned are not for a day or for a week, but are now a regular thing. The immense ore bodies, from a portion of which these results are obtained, are barely touched as yet. There is ore enough in sight in the Panamint and Independent veins alone to run the Manhattan mill for the next six months, without a stroke of work being done to develop them further than they are at present, with the exception of the cross-cut connecting the Curlis shaft with the Panamint vein.

WASHOE DISTRICT.

CON. VIRGINIA.—Gold Hill *News*, Oct. 5th: Daily yield, 400 tons of ore, keeping the mills steadily crushing. The ore breasts on the 1400-ft level are yielding richer ores than for some time past, and are looking splendidly. This ore is east of any that has yet been taken from that level. On the 1550 ft level the ore stopes are yielding richly. The ore and bullion productions of the mine are again steadily on the increase. The mine is in splendid working condition throughout, and it will not be long before the old standard of $2,000,000 per month of bullion will be reached. The new pan mill is being tested and put in order for regular work. It will start up regularly about the 8th of this month. The usual dividend of $2per share, aggregating $1,080,000, was declared yesterday, payable on the 11th inst. Day before yesterday the diamond drills on the 1700-ft level, designed to penetrate to the bottom of the south winze and drain the water, were again started up. The air pipes, however, proved defective, obliging the entire suspension of the work until new pipes can be inserted, which is now being done as rapidly as possible. A large supply of reserve ore is being hauled to the Sacramento and Occidental mills, to guard against any delay that may be occasioned by the storms and snows of winter. The dividend, declared yesterday, makes the thirtieth consecutive monthly dividend paid by the mine, the whole aggregating $22,680,000, and the appearances of the mine warrant the belief that it is good for almost as many more of the same amounts.

CALIFORNIA.—Daily yield, 550 tons, keeping the mills crushing up to their capacities. The ore stopes on the 1500-ft level are looking finely, and are yielding the richest character of ores. The main south drift on the 1600-ft level, running through the center of the ledge, has advanced 18 feet during the week, the face still being in ore equal to any that has yet been developed in the mine. Cross-cuts are now being run at different points on the 1400-ft level, which are opening up ore of a much richer character than has before been developed. The yield of bullion for the month of September will not fall much short of $2,000,000. The mine was never showing better, or in a more prosperous condition than at present. Sinking the C. & O. shaft is progressing at the rate of 12 feet per week. All the blasting, and the entire extraction of the rock from the bottom of the shaft, has to be done under water, at a very great disadvantage. Every blast discharged brings a fresh flood of water, which keeps the pumps steadily running at the rate of ten strokes per minute. The work has been prosecuted in this manner for the last 140 feet. The shaft is now down 140 feet below the 1500-ft level.

CROWN POINT.—The main incline is down 140 feet below the 1700-ft level. Burleigh drills have just been put in, and are worked with compressed air to a great advantage. Much better progress can now be made with the sinking. The main south drift on the 1700-ft level has reached a point about 30 feet directly east of the combination pump-shaft on the Belcher line. The drift was run east of the shaft purposely to give room for the large water tanks required at that point. This connection will be completed as soon as the tanks are in place for the reception of the water. The joint pumping machinery on the south line of the mine started up on Sunday last and works with the utmost perfection. There is not sufficient water in the pump-shaft to hardly give it a fair test, but there is no doubt of its doing immense work whenever it is required. A splendid new air compressor has just been placed ready to run, which will not only facilitate greatly the work on the lower levels, but benefit the air circulation as well.

GOULD & CURRY.—The shaft is now in good working condition to within about 400 feet of the bottom. The main incline has been cleaned out and repaired to the bottom, a distance of 85 feet below the 1700-ft level. The flood of water in the bottom, which formerly resisted all efforts to drain it, has all disappeared, and the bottom of the incline is now perfectly dry. The water has evidently been drained by either the C. & C. or Savage shafts. On the 1700-ft level a cross-cut is now being run east from the shaft to cut the ledge. The main south drift on the 1700-ft level is steadily advancing, the face still in favorable ledge matter.

JUSTICE.—Daily yield, 150 tons of ore. The ore stopes are looking splendidly and yielding good ore. The mills are all kept steadily running on ore from the mine, and the yield of bullion is steadily on the increase. The cross-cuts from the main south drift on the 800-ft level show no change of value for the week. The main south drift on the 1000-ft level is showing much better, and the chances are that it will soon cut a continuation of the rich ore body found on the levels above. The flow of water at the bottom of the shaft is still very strong, and greatly impedes the progress of the work at that point. The condition of the mine for

extracting ore and driving the developmente on the lower levels is heing greatly improved.

NIAGARA.—Everything in and ahont this mine is being pnt in the hest possible working condition. The shait is now down 475 feet, tbe prospects of the ledge where it has been cnt heing of the most encouraging character. The new Board of Trustees have wisely re-elected Mr. William Alperson as superintendent for the ensuing year. The choice is one of the hest that could have been made, Mr. Alperson having proven, by his vigorous management and prosecution of the work of development, that he was the right man for the position.

HALE & NORCROSS.—The water in the main shaft was lowered 208 feet np to Tnesdey afternoon. At that time some new reserve of weter appeared to have broken loose on the lower levels, and it rose steadily, gaining on the pnmps until it hes filled the shaft for a distance of 60 feet ahove the lowest point reached. The rise has not ceased, the pnmps harely holding it in check at that point, and being unable to make any headway against it, although running at the rate of seven strokes per minnte. This sudden rise of the water is snpposed to have been caused by the breaking loose of the floods of water thet had prohably heen dammed np hy caves in the drifts on the lower levels, and cannot therefore he of any lasting or permanent duration.

OVERMAN.—Sinking the main shaft below the 1300-ft level is going repidly ahead. The soit streak of ground recently encountered at the hottom haa heen passed thrnngh, and the hottom of the shait is again in hard porphyry of just such a character as to make the most permanent and durahle kind of a shait. The flow of water is still considerahle, hut is easily handled hy the pumps.

BULLION.—The east cross-cut from the north drift on the 1400-ft level is in much more favorahle grnnnd, with evident indications of soon reaching the mein ledge. The east cross-cut on the 1500-ft level is steadily advancing, and is in very lively ledge material of a favorahle character.

FLORIDA.—The north cross-cnt on the 400-ft level hae been advanced 20 feet during the week. The rock in the face of this cross-cut is much softer. The flow of water is very strong. During the week several fine stringers of qnartz have heen passed through hy this drift.

SAVAGE.—The pumping machinery is doing splendid work, end, assisted hy the Hele & Norcross pumps, had reduced the water over 200 feet up to last Tuesday afternoon, when a fresh tlood of weter poured into the shaft, causing a rise of 60 feet in less than 36 hours in the main shaft. The rise has, however, heen again overcome.

CALEDONIA.—At the 1150-ft station a drift has heen started northward, for the donble purpose of prospecting the ore veln in that direction and making a connection with the south drift on the 1200 ft level of the Overman for air purposes.

TWIN PEAKS.—The hoisting works shaft over the new huilding is completed. The shaft is down nine feet, the first two sets of timbers having just heen pnt in. This shaft is situated several hundred feet east of the old shaft and the croppings of the ledge.

BEST & BELCHER.—The continned hot weather greatly impedes the progress of the developments on the lower levels, the air always heing much hotter and poorer in deep mines during the hottest seasons. But little prospecting is heing done in the mine at present and hut little can be done on the lower levels nntil the new pnmping machinery of the Gould & Curry is completed.

AREOLA.—Total depth of shaft to-day, 63 feet, and heing well timhered throughont. The hottom of the ehaft is all in quartz, with clay seams.

BELCHER —Daily yield, 300 tons of ore. No changes in the ore hreasts, which are showing very well. The new and powerfui combination pumping machinery started into full operation last Monday morning, and works with the ntmost perfection.

NORTH CON. VIRGINIA.—The new pumping machinery is working splendidly, and drains the water without an effort. Sinking the shaft is going ahead at the very rapid rate of four to five feet per day.

NEW YORK.—Three shifts of men are employed at three different points, cntting out the third compartment of the main ehaft. As soon as the shaft is completed the pumps will he lowered into place and the sinking resumed.

IMPERIAL.—Daily yield, 35 to 40 tons of ore. The ore stopes on the 2000-ft level show little or no change.

ROCK ISLAND —The flow of water at the 850-ft level still continues very strong and keeps the pumps husily employed.

CALCUTTA.—The diamond drill is still heing pnshed downward in search of the rich honanza at the lower levels, and very encouraging assays are occasionally met with, showing that the drill is on the right treck. It has already penetrated to the depth of a little over 300 feet.

KOSSUTH.—Sinking the main shaft is making excellent progress. Prospecting the 500-ft level is heing pushed ahead with great vigor.

JULIA.—The sonth drift on the 1600-ft level, running to connect with the Ward shaft, has passed throngh the helt of hard qnartz recently encountered, and is now in quartz of a very fine charecter. This hody of qnartz is much further to the eastward than any that has hefore heen opened in that portion of the mine, and is looked upon as a highly encouraging feature.

YELLOW JACKET.—The main south drift on the 1740-ft level, on last Monday, made the connection with the north drift on the 1700-ft level of the Crown Point mine. This connection has greatly cooled and henefited the main incline and the 1740-ft station.

AMAZON & GLASGOW.—The pnmp is in place, the hoilers set, the machinery heing pleced in position, and next week the work will he started up again, when sinking the combination shaft will he resumed under the most favorahle anspices.

OPHIR.—Daily yield, 300 tons of ore. There is little or no change in any of the ore-producing sections of the mine.

PHIL. SHERIDAN.—Sinking the main shaft is making excellent progress, the hottom in very favorahle ledge material.

HERSAL.—The drift north from the 180-ft level hes advanced 20 feet, encountering some very fine hlack snlphurets and chlorides, and with every indication of soon finding a large hody of ore.

SILVER HILL.—Cntting out for the pump station at the 600-ft level is completed.

LADY BRYAN.—The erection of the new and powerfnl pnmping machinery is making excellent progress. This machinery is all paid for, and when once in operation will rank with the finest and most serviceable on the Comstock lode.

WARD.—Sinking the main shaft ie making good progress, notwithstanding a conelderahle flow of water, which gave some trouble.

SIERRA-NEVADA. — Cross-cntting the 1250, 1500 and 1700-ft levels is being carried forward in the usuel energetic manner.

DAYTON.—The developments on the 300, 500 and 700-ft levels are heing prosecnted with vigor.

BALTIMORE & AMERICAN FLAT.—The drifts south on the 1050-ft level are showing somewhat of en improvement.

LEVIATHAN.—The north drift on the 800-ft level is steadily advancing, with more favorahle prospects than for some time past.

CHOLLAR-POTOSI.—Sinking the main incline is making steady progress. Sinking the combinetion shaft is also making rapid progress. Dally yield, 110 tons of ore.

SUPERIOR.—The west drift at the 160-ft level is showing better every day, the quartz and ore becoming more concentrated and of a hetter quality.

SUTRO TUNNEL.—Face of heading in herd porphyry, with streaks of quartz and clay. Total length of tunnel, 14,483 feet this morning

Continued on Page 260.

(Continuad from Page 250.)

reanction and the preservation of the health of the workmen, the government had referred the petition to the highest mining authority, which had agreed with Pellet to test his process under the following conditions: The reduction of the quickeilver ore taken from the same pile should take place simultaneously in two furnaces, one to be constructed according to the direction of Pellet, and the other to be modeled after the furnaces then used in Almaden, and the obtained results to be placed side hy side for comparison. Pellet had received, with the greatest readiness, during his presence of two years at Almaden, and even before the beginning of his principal trial, all the required means and assistance; and, furthermore, in a preliminary trial for the discovery of some possible defects, he had been materially aided. Workmen for the training in the work of the new process had been placed in his charge and in every respect the greatest possible latitude in his actions had hean granted to him. But notwithstanding these opportunities favorable to success, a large number of laborers had got sick, and a smaller yield of quickeilver had been obtained, and, without counting the cost of erection, the expenees had heen greater than was usual at Almaden. Pellet had acknowledged the trial and the ohtained results, but after the expiration of two years he had rejected the trial and had insinuated that Monasterio was responsible for the failure; and therefore, he, Salazar, could not accept the invitation to Albunol. Salazar asserts further that the failure of both trials in Almaden and Albunol had not heen sufficient to refrain Pellet from making a third trial. Pellet had transferred his invention to a company, to which the Spanish government had granted a repetition of another trial. Salazar does not doubt but that this would be another competitive trial, that one furnace would be constructed according to Pellet's direction, and the other after the Almaden old style, that in both the same quality of ore would be used and that all necessary caution would ba taken at the trial. He also thinks it indispensable not to lose sight of the experience already gained at the former trials, and to guard against any error which might give a right to the inventor to claim the premium of 15,000,000 reales. He (Salazar), thinks the decision of the new trials of Pellet's process under all circumstances as determined, for the following reasons:

1. The appointed commissioners possess the most extensive knowledge of mining and reducing quickeilver ores.

2. In case this trial should result in favor of Pellet's process it would be imperative that another trial should be ordered, to decide the contradictory results of the trials so far made.

In the following volume, XXIII, of the *Revista Minera*, no mention is made of Pellet's process, with the exception of the single allusion to the first unsuccessful trial, and as Salazar, (page 389, etc., of this vol.) when speaking of some objections which had been made against the furnace of Bustamante, commends the said furnace, it would appear that the trial had not then taken place. Salazar will doubtless publish, in the *Revista Minera*, the results of the new trial as soon as it shall have ended, and will, at the same time, make publicly known the peculiarities of Pellet's process, and the application of the contrivance employed.

The Combination Shaft.

The following description of the Chollar, Hale & Norcross and Savage shaft company's works is from the Virginia *Enterprise*: The development of the Comstock is continually putting on new phases. One project after another is conceived and carried out, and generally these are gradually becoming of greater magnitude and importance. Improvements are being made also in the facilities for conducting extensive operations, until almost any attempt seems feasible, and no plan which has for its object the furthering of the general desire of following our great lode to increased depths, is seemingly too great to be undertaken and carried out successfully. In some respects the greatest of all these undertakings is that of

The Chollar-Norcross-Savage Shaft Company,

Who are carrying on operations east of tha southern part of the city. As a step preparatory to the inauguration of this truly mammoth enterprise the company, after its incorporation, took up and inclosed 35 acres of land east of tha ravine leading down into tha Six-mile canyon, and a mile south and east of the city. This land is now owned and occupied hy the company and upon it are situated the works hereinafter described. Having secured the desired site for future operations the next step was to make it available for their purposes. In order to do this

Approaches Were Constructed

In the shape of grades for a side-track from the Virginia & Truckee railroad, and for a wagon road to an elevated point thereon. Both approaches are easy. The side track on tha railroad is a little over half a mila in length, and takes its run from tha main track at the second tunnel. It is made hy alternate cuts and fills, some of both being quite heavy. These were completed something over a year ago. Tha wagon road winds around the sharp ribs of tha ravine, crossing and recrossing the railroad track, and furnishes a delightful drive from tha city. While all this was going on, I. L. Requa, of tha Chollar-Potosi, the chosen superintendent of the company, was busy maturing plans for the present works.

The Site

Which had been selected was an eligible and commanding one. From it the view of the city is particularly fine. It stands some 200 feet above the bottom of the ravine, just where the hill rounds to meet another ravine coming down further east. Both of these ravines are of great use to the company in furnishing dump-room, a site for reservoirs, etc. In fact, should the company go on with the work till the next Centennial dawns they will still have dump-room to spare. The outlook to the east is magnificent, and the whole site is aptly chosen in every respect.

The Present Works Were Inaugurated

Something about a year ago. The beginning was small but the growth has been wonderful, and it is not even yet completed. But they have grown to the general plan conceived by Mr. Requa till, in the perfection of their arrangements and the magnificence of their design, they are second to none on the lode. First, a double grade was cut out, one lying above the other, and then, on the lower temporary machinery was set up and operations commenced. The upper grade was continued till some three acres were made available for building and other purposes.

The Shaft

Was started on the lower grade, and of dimensions such as were never attempted before. The actual excavation is 30 feet 6 inches in length and 10 feet 6 inches in width. It is in four compartments, three of which are 5 by 6 feet in the clear, the other 6 by 7. This is timbered up with 14 hy 14 timbers in sets of 6 feet each. The lagging is 3 by 12. In the timbering and construction of the shaft only tha best red-spruce timber from Dutch Flat is used. Experience has demonstrated this to outlast any and all other woods used in the mines. As the work of sinking the shaft has progressed the other work has been carried on to its present state of perfection.

The Main Building,

Or engine room, as it is very properly called, is 60x140 feet and 20 feet high. It is in this room that the hoisting and pumping engines are placed and the winch, hereafter mentioned. These engines are put on foundations of hewn stone and set on a level with the floor. The room is well lighted and ready of access, being situated on the upper grade, which is reached by both the side track of the railroad and the wagon road. It extends out over the shaft room, heresfter mentioned, and near the west end a flight of stairs descends to

The Shaft Room.

This is 40x60 feet and 32 feet high, that being the difference in elevation of the two grades. Here the shaft goes down into the depths below, and here the dump is situated, into which is emptied all that comes up out of the ground, and from which the waste is run out. It has an easy communication with both the carpenter and blacksmith shops. The east side of this room is a wall extending from the lower to the upper grade. This is eight feet in thickness on the bottom and 32 feet high, built of hewn granite. It contains four vertical piers. The hatter of the wall is two feet six inches. It is pierced for the shaft-end of the pump-bob, hereafter mentioned.

The Carpenter Shop

Is at the southwest corner of the shaft room. Here are the usual facilities for prepering timbers, lagging, wedges, etc., for the shaft. The machinery is run hy a 35-horse power engine The timbers, planks, etc., all come in by rail, and are dumped from the upper grade directly down at the door of the carpenter shop, where they are handy when wanted. The room is 80x40 feet and 16 feet high. It has a communication also with

The Blacksmith Shop,

Which is at the west end of the main structure, communicating with both the carpenter shop and shaft rooms. It is 30x60 feet, and 20 feet high, and contains two forges and two fires, driven hy a Sturtevant No. 5 blower. Tha motive power is a small vertical engine in an adjacent room. The pipes from the blower lead underground to the fires, thus giving perfect access to them from all sides. Both shops are admirably arranged with the view of facilitating work and communications all through the buildings.

The Remaining Buildings

Are the boiler and drying rooms. The former is situated north of the main building, near the east end. It is 40x50 and 20 feet high, allowing communication directly with the main or engine room. It contains two sets of boilers, 52 inches by 16 feet, containing each 52 three-inch tubes, with supply pumps and all complete. Another set of boilers of the same size is on hand ready to be set up when needed. The drying room is south of the main building, and is 30x50 feet, and used by tha workmen to dry their clothes in. A good drying room is one of the essentials of all mines.

The Machinery

Is first-class in every respect. The hoisting engine in use is 135 nominal horse power, driven hy gearing which makes it equivalent to 350-horse power. It turns a reel upon which is wound and unwound an English steel wire cable 2,900 feet in length. This cable is flat, six by five-eighths inches. The second cable, of like dimensions and make, will be attached in four or five days. It is already on the reel. North of the hoisting engine

A Heavy Steam Winch

Is being put in to handle the big pumps and other heavy substances which are to be raised or lowered in the shaft. This will be strongly geared and handle easily a weight of 60 tons. To this will be attached the hoes cable of the Comstock. It is seven inches by five-eighths, and made of the very best steel wires by Hallidie & Co, of San Francisco, on a special order thereof. It has the strength to handle the pump to the depth of 3,500 feet, if it be required.

The Pumping Engine

Stands in well towards the shaft, and is a most magnificent affair. It will be ready to run in about eight days. It is a compound, vertical condensing engine of 700-horse power, and is to run a double column of 12-inch, eight-feet plunger pumps to any required depth. It will be controlled by a Davy differential valve, by which it will be made to make any number of strokes between one in 15 minutes and 12 in one minute. The stroke will be made in the same length of time, whether the engine be running fast or slow, and when not in motion it will consume no steam. The attachment will be made direct to the bishop-head of tha bob, thus doing away with all unnecessary friction and the liability of intermediate gear to break.

Its Dimensions.

The initial cylinder is 32 inches in dismeter and has a stroke of 10 feet. The expansion cylinder is 64 inches in dismster and has a stroke of aight feet. The whole engine, pumps and bob weigh 150 tons. The cylinders stand on an immense foundation of iron and stone, and side by side, the larger being nearest the shaft of the pump-bob. The beam of this bob alone weighs 52 tons and is all iron. It is known as an imperial beam.

The Pump Rods,

Which are on the ground and ready for use, are tha finest sticks ever seen on the Comstock. They are Oregon pines sawed square, 15 hy 15 inches, each stick being 100 feet in length and as straight and clear as an arrow. The joints at the ends of these are they go together to form the rod will be out squsre and oak kays fitted and driven in so as to make all solid as the native stick. These joints will be still more firmly secured hy iron straps ten inches wide, one inch thick and 35 feet long, one on each side. At every 200 feet two plunger-pumps will be put in, one on each side of the rod. The rod will be balanced by bobs 300 feet apart. For sinking, a suction of 17¼ inches will be used, that being equivalent to the two plungers of 12 inches each. Returning again to the hoisting apparatus,

The Sheaves

And the construction of the gallows-frame are worthy of particular attention. This frame is built upon the top of the wall heretofore mentioned, and the timbers are framed and seonred there in the firmest manner possible. These carry three enormous sheaves, 18 feet in diameter, so set as to carry the cable over to the center of the shaft below. The faces of these sheaves are eight and one-half inches, filled with oak wood where the ropes run, to prevent their crystallization. These are constructed to stand a strain of 100 tons each. Following the cable over the sheaves to the end, we find

The Skeet.

This is a receptable made of boiler-iron and capable of holding five tons. Tha sides are parallel, but the ends are flaring. It rests its bottom on two bars of iron, upon each of which it is hung as a hinge. Being used for sinking, it has false guides reaching 18 feet above its top. As this is run up the shaft and comes to the top of the dump, it is made by an ingenious contrivance to unload itself into either an ore or waste-bin. As it descends again it rights itself, and so no man is needed to stand at the shaft to attend to the work of loading or unloading.

It is Attached to the Cable

By means of several large and strong links, so that if any extra strain comes thereon at any time these links will break and the safeties catch and save the skeet. With this skeet a round trip can be made in one minute. Another one will be in use in four or five days, and then the hoisting capacity of the shaft will not be less than 2,880 tons per day. The capacity of the skeets can with slight expense be increased to ten tons each, but for sinking these would be too high to throw into. Tha skeet empties into the dump between the shaft and the wall before referred to.

The Rope House

Is to be built soma 200 feet to the east of the main building, so that in case of accident by fire the hoisting works will not be endangered. There now stand the reels and they are each connected with the reels on tha engine hy underground trongha through which the cables run in reeling and unreeling. This is a most excellent arrangement and one which, while safe, is very convenient. Tha works are, however, amply supplied with means for

Protection Against Fire.

Connection has been made with tha Virginia and Gold Hill water company's tanks and flumes hy a four-inch pipe laid a mile and a quarter long. This pipe descends into tha bottom of the ravine, a distance of 207 feet below tha grade of the works, and then comes up to where there are three hydrants ready for use. These are so situated as to thoroughly protect

the buildings. Two of them are supplied with the regular fire, star, carbolized hose, while the third is two-inch. The hydrants and hose are well housed and always ready for use.

Miscellaneous.

Winding around the hill to the east is a ditch leading to the reservoir. This has a partition in the center. On one side flows the water to the reservoir and on the other is the return for the use of the condenser. The reservoir has a surface of from 22,000 to 30,000 square feet. The wood for the boiler rooms is dumped to the east of the works, where there is capacity to store 1,000 cords if wanted. The arrangement is very complete and handy. The building is surmounted by a flag-staff of galvanized iron 76 feet six inches in hight, ready to give "old glory" to the breeze whenever occasion requires. The staff is topped with a large golden ball.

Such and So Great

Is the undertaking of the Chollar-Norcross-Savage shaft company to overcome the disadvantage and loss of power incident to working inclines and to gain, at the same time, the depth which experience has shown to be necessary to success in mining. They have, at one step, overcome all these obstacles or will as their work progresses. The dip of the Comstock is to the east, and when it is reached through this shaft, as reached it will be at some time, the lode can be explored and its treasures taken out on a scale almost incomprehensible. In the choice of Mr. Regna for their superintendent they have put the right man in the right place.

Mining in Drytown.—The ancient mining camp of Drytown, which, until within a few months past, has apparently been on the down grade for years, continues to revive perceptibly. The Crown Point mine, which has just been incorporated, is expected to add much to the material interests of that place. One of the shareholders, who has unbounded confidence in the property, informs us that the lead runs parallel with that of the Bonanza mine. The croppings of the ledge are very heavy, and can be traced for 800 feet, averaging about 8 feet in width, all said to be gold bearing. The development at present consists of a shaft 70 feet deep, the width of the ore averaging six feet. Three men are now at work upon the claim. Two crushings of the rock have been had, one comprising 73 tons, yielding $10 per ton, the other giving $10.50. Ground is now being graded for the erection of a ten-stamp mill, which will be pushed to completion as early as possible. It is contemplated to get the water to run the mill from the Gover mine, thereby insuring an almost uninterrupted supply. The Crown Point company is incorporated with 60,000 shares at $1 per share; 9,000 shares are offered to the public to provide working capital. Another quartz discovery has lately been made in the neighborhood, which has been christened the Exchange mine. The ledge describes an acute angle with that of the Crown Point, running in a southeasterly direction. The rock, we are told, will yield something like $20 per ton. Mining experts have great confidence in this claim, and expect that in connection with the Crown Point it will restore Drytown to its pristine glory.—*Amador Ledger.*

Chinese Method of Welding.—Mr Balestier, who went on a mission to the East, describes the Chinese method of welding cracked iron-wares by cementing them with cast iron while in a liquid state. In a cast-iron pan which Mr. B. required to be welded, the operator commenced by breaking the edges of the fracture slightly with a hammer, so as to enlarge the fissures, after which the fractured parts were placed and held in their natural positions by means of wooden braces. The pan being ready, crucibles, made of clay, were laid in charcoal and ignited in a small portable sheet-iron furnace, with bellows working horizontally. As soon as the pieces of cast iron with which the crucibles were charged were fixed, it was poured on a layer of partly charred husk of rough rice, or paddy, previously spread on a thickly doubled cloth, the object of which is to prevent the sudden cooling and hardening of the liquid metal. Whilst in the liquid state it was quickly conveyed to the fractured part under the vessel, and forced up with a jerk into the enlarged fissures, whilst a paper rubber was passed over the obtruding liquid inside of the vessel, making a strong, substantial and neat operation.

Fog Signals.—An interesting experiment with fog signals is about to be tried at Heligoland. At the extremity of that island farthest from its little town of 900 people is a steep cliff overhanging a dangerous shore, and for a long time past ships belonging to various nations, but more especially to Germany, have suffered disaster at the spot. The English Government has been solicited to establish a signal station there, and the Trinity Board, to whom the matter was referred, have resolved to accede. The establishment of the new station will be marked by the employment for the first time of gun-cotton to produce the warning reports. The gun-cotton will be in discs varying from one-half pound to one and one-half pounds; they will be kept wet, and will be fired in that state by electricity, a dry primer and a detonating fuse. A sergeant of artillery will go out in charge and work the signals, which are made of various powers, to be used according to the state of the weather. No gun, reflector or other appliance is to be used with the cotton, thus effecting a saving in stores.

Useful Information.

Construction of Petroleum Tanks.

The magnitude of the petroleum resources of some of our Southern counties is attracting the attention of capitalists, and investment in the shape of machinery, etc., is being freely made. A necessity of the industry is for tanks. We find in the *Scientific American* an article on the construction of tanks, written by W. S. Newall, which may be of value to our Southern readers:

Storage tanks, whether built by private enterprise or constructed in the interests of the pipe lines, are necessarily of iron. They must needs be of some such material in order to resist the pressure of enormous quantities of fluid intended to be stored within them. Their contents vary all the way from 8,000 or 9,000 to 25,000 barrels of 42 gallons each. These tanks are constructed of heavy iron, riveted together and made fluid tight in the usual boiler fashion. The first step, after the bed has been made by carefully compacting and leveling the ground on which the tank will rest, is to lay out the sheets which are to constitute the bottom on wooden horses properly arranged in the bed. These bottoms are then riveted together until a vast iron disk of the required diameter is produced; the diameter in the case of a 20,000 barrel tank, for instance, being about 80 feet. It is calculated in a rough way that the bottom of the tank, with the first ring of siding attached, is chargeable with half the cost of the whole tank. This first ring is attached to the bottom by means of a number of L-shaped pieces, to which these parts are respectively riveted. The remaining rings are attached or built up in the usual boiler fashion. At the proper time the wooden bases are withdrawn; and by means of jack screws or similar devices, the tank is let down upon its earthen bed. The roof is either of iron or of wood. Iron roofs are sometimes constructed of something akin to ordinary roofing metal, properly supported by a frame within, if the tank be small; but if it be large, the roof is generally constructed of heavier sheets, riveted together. The vast majority of tanks have wooden roofs. Out of 85 examined recently, only 18 had iron tops. Wooden roofs are generally tarred and graveled. Sometimes, instead of being flush with the top of the tank, they are set some inches below it, forming a water top intended to hold water. Sometimes they are covered with earth, in which vagrant grass seeds take root, the roof presenting somewhat the appearance of turf. These are the earth tops.

Every roof has a manhole, generally upon the principle of an ordinary house scuttle. It affords access to the interior of the tank for cleansing and other purposes. There is a supply pipe which runs up the side of the tank and enters at the top near the manhole. About an inch or so above the bottom, one or more drawing-off pipes are inserted. Access to the roof is secured by a wooden ladder or steps; these are generally permanent attachments. Across the roof, be it of wood or iron, a slatted or oleated wooden walk is provided, so that the roof may not be injured by being trodden upon. Sometimes, if tanks are near together, their roofs are connected by wooden bridges or plank ways, that easy access may be had to all. Sometimes the base of the tanks is earthed up for three or four feet with sloping banks of gravel.

Sometimes a trench two feet in depth is dug about the base, with an opening towards the downwards slope of the land. When the tank is completed, it is subjected to an hydraulic test; water to its full capacity is pumped in; and if the tank bears this strain without either bursting or leaking, it will of course withstand the pressure of an equal quantity of oil. Occasionally the water pressure proves too strong, particularly if the iron has not been of a good quality. The tank, now completed, receives its contents through the supply pipe, the oil coming through, it may be, miles of piping, either direct from the wells or from other tanks or from barges laden with the oil in bulk. In this way the oil producing country is threaded with countless miles of piping, sometimes above ground, sometimes on or beneath its surface, and sometimes in the beds of rivers.

Some tanks are on the tops, others on the sides or in the hearts of mountains, others at their base. Sometimes they cluster together in particular localities by the dozen. Frequently we find knots of tanks, only from five to ten feet apart, hence all morally certain of destruction by the fire that seizes upon any one of them. On the other hand, where wiser foresight has prevailed—as on the Anchor farm, Chestnut hill, opposite Parker—it is made obligatory upon tank owners to build at least 200 feet apart. There are now 12 tanks upon the summit of this hill. At Mount Nebo, just south of Parker, there are ten tanks separated by distances varying from 100 to 150 feet; while at Montrose there are ten new tanks being built on the river bank, separated from each other by only 50 to 75 feet.

Gold leaf is cut by placing it on a flat, clean leather pad, pressing it very gently and sawing with a perfectly straight-edged knife or split cane. The dutch metal may be cut between paper by close shearing scissors, with such long blades that each cut is made with one motion.

Saving Waste Iron.

The progress in saving waste material is apparently prompted by a method which professes to use profitably the very lowest classes of scrap iron. The latest issue of the *Bulletin of the Iron and Steel Association* contains the following: Mr. William Batty, of 140 Hazel street, Philadelphia, has invented a process by which partly decarbonized iron, such as stove and machinery scrap and the harder numbers of pig iron, 2, 3 and 4, can be melted and made softer, or carbonized to such an extent in melting as to take the place of No. 1 pig for all kinds of castings. By this process any old stove can be made in one melting into a new one. An old tin roof may be transformed into any kind of cast iron article, and clippings of tin and other tin refuse can be utilized in making castings. The inventor claims to be able to melt iron waste of every description, and produce therefrom castings of any desired quality, by modifying certain details and varying the duration of the operation, the rapidity of which (that is, the productive capacity of the cupola) he claims to have doubled, while effecting a decided economy in the consumption of fuel. The essential part of the process seems to be to decarbonize the iron, which always loses carbon when being melted in the usual way. This is accomplished by introducing into the furnace a larger proportion of carbon than is contained in the coal, in such a way as to combine with the oxygen of the blast. This is done by dropping in the blast pipe, just before it enters the tuyeres, a fine powdered pure carbon. The oxygen of the blast commingling with the carbon, they both strike the melting zone together, and each atom of oxygen having an atom of carbon with which to unite, a neutral flame is obtained, in which the heat is very intense. The iron is made better, melting more rapidly, and there being no oxygen whatever left to combine with the carbon in the iron, but rather an excess of carbon being present, the iron becomes carbonized, and therefore softer after melting than it was before, a result entirely contrary to that now obtained by iron founders. Where iron is very much decarbonized, Mr. Batty uses as an auxiliary a bed of charcoal in the bottom of the cupola furnace below the tuyeres. The slag that forms in the furnace lies between the tuyeres and the top of the charcoal bed, and prevents the latter from burning out, while the molten iron circulates through the charcoal and takes up such a quantity of carbon as will refine, purify and soften the cast iron. Mr. Batty's process has been in constant operation in Philadelphia, under his own supervision, for a considerable time, working up tin scrap, old roofing, etc.

A Laundry Secret.—The following recipe for doing up shirts will be found of use to many housewives: Take two ounces of fine white gum arabic powder; put it into a pitcher and pour on it a pint or so of water, and then having covered it up let it stand all night. In the morning pour it carefully from the dregs into a clean bottle and cork it, and keep it for use. A tablespoonful of gum water stirred into a pint of starch made in the usual manner, will give to the lawns, either white or printed, a look of newness, when nothing else can restore them, after they have been washed.

Swimming a Horse.—On reaching deep water, the rider should relieve the horse of his weight, by sliding into the water beside the horse, grasping the mane near the withers with one hand, thus requiring the horse simply to tow the rider, the latter assisting him in this by using his legs and free arm in the same way as in swimming. In crossing rivers with rapid currents the rider should take the down stream side of the horse.

Mercury is made to adhere to any metal by putting a very little sodium with the mercury, the hundredth part by weight is ample. The sodium mercury may, if necessary, be washed off by fresh, pure mercury, which continues to adhere.

Good Health.

A Generation on the March.

A recent English magazine gives the following interesting summary of statistics concerning the life and death of a generation of people:

An English generation on the march from the cradle to the grave is an instructive spectacle. Let us trace the physical fortune which any million of us may reasonably expect. The number, to begin with, is made up of 511,745 boys and 488,255 girls, a disproportion which, by and by, will be redressed by the undue mortality of the boys, and will be reversed before the close of the strange, eventful history. More than a quarter of these children will die before they are five years old—in exact numbers, 141,387 boys and 121,795 girls. The two sexes are now nearly on a level. The next five years will be much less fatal. In the succeeding five years, from 10 to 15, the mortality will be still further reduced. Indeed, for both sexes this is the most healthy period of life; the death-rate, however, is lower for boys than for girls. There will be some advance in deaths in the next five years and still more in the five which follow, but 634,045 will certainly enter on their 26th year. Before the next ten years are at an end, two-thirds of the women will have married. The deaths during that period will be 62,052, and of these no fewer than 27,134 will be caused by consumption. Between 35 and 45, a still larger "death-toll" will be paid, and little more than half the original band—in exact numbers, 502,915—will enter on their forty-sixth year. Each succeeding decade, up to 75, will now become more fatal, and the numbers will shrink terribly. At 75 only 161,124 will remain to be struck down, and of these 122,559 will have perished by the 85th year of their march. The 38,565 that remained will soon lay down their burdens; but 2,153 of them will struggle on to be 95, and 223 to be 100 years old. Finally, in the 108th year of the course, the last solitary life will flicker out. Such, then, is the average lot of 1,000,000 English men and women.

The Apple Cure.—The apple cure is the use of apples as food, on the same principle that grapes are used. The cure by apples might be equally popular if introduced. Who has an orchard where it can be tried? The scenery and surroundings should be good. A writer in the *Laws of Life*, for June, states that after being troubled with heartburn, wakefulness, indigestion, etc., he adopted the practice of eating apples with each meal, daily. The wakefulness and heartburn are gone. He is cured. When he began he weighed 130 pounds. Two months later he had increased to 160 pounds, his strength being similarly increased. Instead of "bitters for the stomach, cathartics for the bowels, iron for the blood," all of which weaken the vital organs and give a relief that is only temporary, apples are a natural stimulant. Apples, like medicine, induce a sustained healthy action of all the organs. Apples are, besides, very nutritive, and rightly termed the "bread of fruit."

Alloys of Tin and Lead.—Dr. Knapp, of Brunswick, Germany, has been investigating the use of these alloys for culinary purposes. He has studied their behavior with distilled water, vinegar and ordinary salt solution; and corrects the idea that the mere proportion of mixture of the metals or the chemical constitution *per se*, is decisive as to the behavior of the alloys. There are at least two other important points to be considered, namely, the mechanical nature of the surface of the metal and the nature of the attacking substance. To these may be added the joint action of atmospheric air, the time the metal has been attacked and the temperature. One alloy, A, with an equal amount of tin, contained nine times more lead than another alloy, B, but gave up, with vinegar, not nine times but nearly 26 times more lead. With ordinary salt solution, on the other hand, B lost over 21 times more lead than A. In diluted water, also, A resisted both.

Carbon Bisulphide as an Antiseptic.—Herr P. Zoller publishes the statement in the *Deutsche Industrie Zeitung*, that, in an atmosphere containing a small quantity of the vapor of carbon bisulphide, animal and vegetable matters are effectually preserved against decomposition or putrefaction. The author affirms that a few drops of this substance is sufficient for the purpose; and since it volatilizes at ordinary temperature the employment of heat is rendered unnecessary. In this manner, he adds, bread, vegetables, fruit of every kind (and fruit juices), and meat may be preserved for a considerable time in closed vessels. Upon opening the vessels the unpleasant odor of the bisulphide is very apparent; but upon airing the substances treated for a few minutes, it disappears entirely by volatilization. In the case of meats, the flesh, after having been submitted to the above treatment for several weeks, is in no wise unpleasantly affected.

Body and Mind.—Science and medicine are demonstrating that the body and the mind are so intimately related to each other that we are driven to believe in physical health as a most desirable, if not always necessary, condition of moral and religious health. We ought to cultivate health of body in every direction; we ought to cultivate and restrain the passions; we ought to carefully observe the hygienic and sanitary laws; we ought to give our children a good birth, and we ought to cultivate moral goodness, love, truth, faith and religious confidence, as being, each and every one in its own way, conducive to health, happiness and righteousness. If we need the Holy Ghost within, we need frequent bathings without; if godliness is to be sought after, so is cleanliness; if faith is necessary to salvation, so is purity of body; sin is not worse than filth; devil means dirtiness; total depravity is being badly born; grace has its counterpart in physical vigor.

Sunshine.—The world wants more sunshine in its disposition, in its business, in its charities, in its theology. For ten thousand of the aches and pains and irritations of men and women we recommend sunshine. It soothes better than morphine; it stimulates better than champagne; it is the best plaster for a wound. The Good Samaritan poured out into the fallen traveler's gash more of this than of oil. Florence Nightingale used it on the Crimean battlefields. Take it into all the alleys, on board of all the ships, by all the sick beds. Not a phial full, not a cupful, not a decanter full, but a soul full. It is good for spleen, for liver complaint, for neuralgia, for rheumatism, for falling fortunes, for melancholy. Perhaps heaven itself is only more sunshine.

A law has been passed in Germany forbidding the construction of school-rooms with windows on both sides, as they are injurious to the eyes.

MINING AND SCIENTIFIC PRESS

W. B. EWEB.....SENIOR EDITOR.

DEWEY & CO., Publishers.

A. T. DEWEY, GEO. H. STRONG
W. B. EWER, JNO. L. BOONE

Office, Nn. 224 Sansnme St., S. E. Corner nf California St., San Francisen.

Subscriptinn and Advertising Ratea:

ADVERTISING RATES.—1 week.	1 month.	3 mos.	12 mos.
Per line.....	.25	.80	$2.00	$5.00
Half inch (1 square)...	$1.00	3.00	7.50	24.00
One inch.....	1.50	4.00	12.00	40.00

Four weeks are rated a month.

Large advertisements at favorsble rates. Special or reading notices, legal advertisements, notices appearing in extraordinary type or in particular parts of the paper inserted at special rates.

SUBSCRIPTIONS payable in advance—For one year, $4; six montas, $2.25; three months, $1.25. Remittances hy Registered letters or P. O. orders at our risk

SAMPLE COPIES.—Occasionally we send copies of this paper to persons who we believe would be benefited by subscribing for it, or willing to assist us in extending its circulation. We call the attention of snch to our prospectus and terms of subscription.

THE ORIGINAL ARTICLES in this paper are mostly set in solid type, giving in our columns one-third more reading than is contained in ordinary leaded matter.

ADDRESS all letters to the firm, and not to individnal members, or others, who may at any time be absent from our office.

Our latest forms go to press on Thursday evening.

San Francisco:

Saturday Morning. Oct. 14. 1876.

TABLE OF CONTENTS.

GENERAL EDITORIALS.—Roller Shelf Edge; Comstock Papers, 249. A New Method of Packing and Befining Sulphur; Aerial Navigation; Gems and Precious Stones, 256. The Centennial at Philadelphia, 257. Mines Around Eureka, Nevada; The Burleigh Air Compressor at the Crown Point Mine, 260. Patents and Inventions, 261,

ILLUSTRATIONS.—Boone's Improved Roller Shelf Edge, 249. Art Gallery—International Exhibition, 257.

CORRESPONDENCE.—Alpine Connty—Its Mines and Resources, Past, Present and Future; Tyho District, 250.

MECHANICAL PROGRESS.—Skill in Engine Firing; Starting Reversing Engines; A New Preventive for Slipping; Extinction of Fire on Board Ships; Boiler Explosions; What the Centennial is Doing; Wooden Wall Paper, 251.

SCIENTIFIC PROGRESS.—Electric Lights at Sea; Influence of the Sun's Heat; Rediscovery of a Lost Planet; The Growth of the World; The Pressnre of Sunlight, 251.

MINING STOCK MARKET.—Sales at the San Francisco, Pacilic and California Stock Boards; Notices of Assessments; Meetings and Dividends; Review of the Stock Market for the Week, 252.

MINING SUMMARY from various counties in California, Nevada, Montana, Idaho and Utah, 253-54-60.

USEFUL INFORMATION.—Construction of Petroleum Tanks; Saving Waste Iron; A Laundry Secret; Swimming a Horse, 255.

GOOD HEALTH.—A Generation on the March; The Apple Cure; Alloys of Tin and Lead; Carhon Bisulphide as an Antiseptic; Body and Mind; Snnshine, 255.

GENERAL NEWS.—General News Items and Miscellaneous Paragraphs, on 261 and other pages.

MISCELLANEOUS ARTICLES.—Working Quicksilver Ores, 250-54. The Combination Shaft, 254-5. Mining in Drytown; Chinese Method of Welding: Fog Signals, 255. Coast Railroad Items, 261.

PERSONAL.—By Wednesday morning's overland train, Alfred T. Dewey, senior member of the firm of Dewey & Co., took his departure for a visit to the East aud the Oentennial. Mrs. Dewey accompanies him. In the absence of our chief, we are free to inform the readers of the PRESS how richly Mr. Dewey is entitled to the brief respite for rest and recreation which he has taken. He labors for the success of his publications, and in the interest of those who patrouize them, with an untiring zeal and devotion not common among men. The success of the publications themselves is the best evidence that he labors wisely and effeotively. While he profits in strength by the enlivenment of chaugiug scenes, we have no idea that he will be idle, but expect that his journey to the East will secure for the PRESS new attractioos and points of inoreased value. We wish him a most happy and prosperous journey and a safe and speedy return.

GEORGE W. AMOS, driver of engine No. 4, who was thrown from this seat while going to a fire on Fifth street about ten days ago, and sustained serious injuries, died on Snnday. He was one of the oldest drivers in the paid department.

THE Society of Pioneers have decided to meet on the 25th instant to consider the question of electing a successor to the late James Liok, president of the society.

ON FILE.—Letter from Tybo District, Nevada; Alpine County Mines; Leaching Processes; Mechanical Ore Conoentration.

THE eleventh annual convention of locomotive firemen is being held in Baltimore with closed doors.

THE St. Louis fair closed on Satnrday, after a very successful week. The receipts were about $70,000.

A New Method of Packing and Refining Sulphur.

Edwin J. Fraser, of this city, has recently patented through tbe MINING AND SCIENTIFIC PRESS Patent Agency an improved process and apparatus for producing mercantile snlphur from deposits of crude sulphur or sulphur ore, the object being to provide a cheap and simple method of refiniog and packing the sulphur so that its production in a suitable form and condition to reuder it marketable can be accomplished at a small expense. This method the inventor thinks will render the working of snlphur deposits profitable even when the refined product commands a low price iu the market. As there are large deposits of sulphur on the coast, some description of the process will be of interest.

Instead of separating and removing the sulphur from the matrix or gangue with which it is intermixed in its natural state, by sublimation, and restoring the fumes to a solid form by condensation, as has been heretofore practiced, Dr. Fraser accomplishes the separatiou by fusion and settling, and then refines by passing the sulphur through suitable strainers, by which the gangue or earthy portions of the ore or crude sulphur are separated and the pure sulphur obtained. The ore or crude sulphur as it comes from the mine is dumped into a tank under which is a furnace. Sufficient fire is maintained in this furnace to tuse the sulphur in the tank and reduced it to a liquid form, so that the heavy impurities or gangue will settle to the bottom of the tank. The fused sulphur is drawn from the tank by means of sponts and deposited in a filtering bag. This filtering bag is suspended over a second tank, under which is also a furnace, so that the strained solphur will be received in the tank and kept in a liquid condition so as to allow a further settling of the impurities.

The filter employed is made of a textile fabric of sufficient porosity (such as common bleached muslin) to allow the liquid sulphur to strain through and yet retain the impurities or earthy matter in the bag. This style of filter will serve an excellent purpose as loog as it is kept heated and the filtering operation is coutinned, but care must be taken not to allow the bag to become cool or chilled, otherwise its filtering quality is destroyed and it must be thrown away. The tube inside which the bag is suspended prevents tbe air from striking its exterior aud cooling it, while the heat from the fused sulphur in the tank keeps it in a properly heated conditiou. A filtering bag made of this material, however, will require to be removed and a fresh one substituted when the impurities accumulate inside of it sufficiently to clog its interstices. In the settling tank the heat of the furnace keeps the sulphur in a fluid condition and ordinarily the settling is completed, but if found desirable other settling tanks can be used. From the settliug tanks the sulphur is drawn off through the spout and packed by Dr. Fraser's improved process, which is as follows:

Ontside of the settling tanks is placed a tauk, which is filled, or partially filled, with water. Over this tank is suspended a short tube or cylinder, so that the spout which draws the liquid sulphur from the settling tank will deliver it into the upper open end of the tube. The inventor then takes a sack made of common textile fabric, and dips it into water so as to thoroughly saturate it, and then draws its open end ou over the tube referred to, so that its lower end will hang iu the water tank. The liquid sulphur is then allowed to flow from the spout into the sack through the tube. As the sulphur strikes the wet sides of the sack it is instantly chilled and solidified so as to form a shell on the inside of the sack, which prevents it from passing through the meshes of the cloth. The weight of the sulphur as it accumulates withdraws or forces the sack gradually off of the tube so that it settle into the water in the tank until it is filled. It is then removed from the tank and set away to cool. This method of packing sulphur is extremely economical and convenient. The sacks, containing as they do a solid roll of sulphur, are easily handled, and none of the sulphur is wasted in case it should become broken. The tanks are mounted one above another so that the sulphur can be drawn directly from one into the other. The inventor thus produces a simple and effective process for redncing, refining and packing sulphur, which will be specially valuable when the deposit is largely composed of sulphur, as in several instances where it is found on the Pacific coast. This process of refining and packing is now in use at a mine in Humbolt county which produces about six tons of pure sulphur per day. It is found to answer exceedingly well and is much more economical than the methods previously in use.

THE United States coast survey party, under Captain Elliott, is now engaged on Puget sound taking hydrographical and typographical notes above the line of the coast, making charts, maps, etc., for publication by the Government. The party has accomplished a large amount of work thus far.

THE Comstock mining companies have levied $45,925,153 in assessments, and have paid $82,924,199 in dividends, showing an excess in dividends over assessments of $36,996,046.

Aerial Navigation.

Has any earnest, persistent and systematic attempt yet been made to produce a machine or craft capable of navigating the air? Periodically some enthusiast makes his debut with flattering promises and possible prospects, but as often he sinks back into oblivion without leaving any substantial evidence of progress to immortalize his name. In fact, has any real and important discovery or improvement in aerial navigation been made since Montgolfier discovered that a bag filled with rarefied air or gas would float in the atmosphere? These questions naturally present themselves to us in commencing to write an article on aerial navigation. A careful examination fails to discover any decided advance towards the successful solution of the problem. We have certainly made discoveries which enable us to more fully comprehend the philosophy of ballooning, so that we are able to utilize and take advantage of the flight of balloons for many purposes, but have we made any substantial progress towards the production of a practical and useful solution of the question of aerial navigation? By practical and useful we mean the production of a craft or vessel possessing all the elements of utility, adaptability and manageability. The mere demonstration of the fact that a balloon will rise in the atmosphere and float upon the air currents at once surrounded the fact with many philosophic corollaries which we had long before deduced from our knowledge of the laws of motion, of the laws of gravity and of the laws of nature, and these established rules we were able to apply at once from our knowledge of them derived from other sources. As soon as the main fact of possible flotation was demonstrated we immediately and almost intuitively became cognizant that certain rules and regulations were involved in the act, and so far only as we have been able to apply them have we been able to control and utilize the discovery. The fact is, that the discovery of Montgolfier stands alone by itself until some other great discovery shall enable us to overcome existing disabilities and thus accomplish what at present is impossible. It is one of the meteors which the world encounters in its flight through space that is of but little account to build a meteoric house with, until others are overtaken to supply the deficiency. We do not doubt but that the deficiency will be supplied. The meteors are somewhere whirling in space, and it is only a question of when we shall overtake them.

The conditions incident upon successful air navigation are different from those involved in water navigation. In the former the vessel or craft is submerged in a single fluid of a uniform or nearly uniform density, while in the latter the vessel floats in a medium of sufficient density to sustain it on a permanent level, while the greater portion of its bulk is in a lighter and more active element, so that the gravity of the vessel and the comparative sluggishness of its sustaining fluid counteracts the fickleness and activity of the atmosphere or upper element. If the ship were entirely submerged in water there would still be elements of difference to prevent us from drawing a parallel case, because water is dense, sluggish and non compressible, while air is rare, active, elastic and practically imponderable. Although a fish can dart through the water with great speed and control its actions perfectly, it would make a sorry bird, and a bird, although a perfect swimmer in the air, would never soar well in the water. We must therefore learn from the bird and not from the fish how to navigate the air. A dead fish will float in the water, but a dead bird will not float in the air. The bird therefore is heavier than the air, so that practically our balloon does not help us so far. The bird has wings and great muscular power to move them, and herein is certainly the secret of aerial navigation. Let us make an hypothetical example. Say that a bird weighs two pounds and that the area of its two wings is 100 inches and that its muscular power is sufficient to lift five pounds. Now, a vessel weighing 100 pounds, engine and all, to be equal in proportion must have 5,000 square feet of wing surface, and an engine capable of lifting 250 foot-pounds in order to simply propel itself through the air, and when we come to make it of a practical size and load it with human or other freight, we simply render the matter impossible. We therefore fall back upon our balloon again, because it enables us to obtain an equipoise or even flotation if desired. Utilizing this discovery we can make as large a vessel as we may desire and by inflation take away its weight so that it will float of its own volition. When we do this, however, we increase the size and consequently the resistance area, thus necessitating a propelling agency of increased power. It thus resolves itself into a question of suitable power. If we could produce, in a small compass and in a light form, an engine of sufficient power, the question of aerial navigation would not long vex us. We pause to see who will supply the wanted motor.

THE California and Consolidated Virginia mines paid out $94,463 for labor last month. The amount was divided between 933 men, and all of it was in gold, except $5,663, necessary in making change.

Gems and Precious Stones.

[Written for the PRESS by HENRY G. HANKS.]

S. Turquois.

This mineral occurs in incrustations and in reniform or stalactitic masses. Its color is sky blue, bluish green to apple green. Hardness, 6; specific gravity, 2.6, 2.83-2.61; streak, white or pale green; tracture, concboidal. The true turquois is a hydrous phosphate of copper and alumina, with generally a small portion of oxide of iron or sesquioxide of iron. An analysis of a specimen of blue Oriental turquois gave the following result: Phosphoric acid, 27.34; elumina, 47.45; oxide of copper, 2.02; water, 18.18; sequioxide of iron, 1.10; oxide of manganese, .50; phosphate of lime, 3.41=100.00.

In a closed tube the turquois decrepitates and yields water, turning at the same time black or brown. B. B. in platinum points becomes brown but does not fuse. The blowpipe fisme becomes green. After wetting the assay with hydrochloric acid the blowpipe flame is blue, from the copper present in the mineral. A bead of horax glass in a loop of platinum will become yellowish green on the addition of a minute portion of the powdered mineral and application of a strong heat. In cooling, the bead becomes green. On charcoal, by skillful manipulation a bead of copper may be obtained.

Turquois finds its way to commerce from Persia. According to the most reliable accounts it is found in veins which traverse the mountains in every direction. Pieces the size of a hazelnut are unusual. There is a deposit of turquois in the State of Nevada, at Columbus, which should be more thoroughly prospected. Very fine specimens occur in that locality.

Turquois can be polished, and when of good quality is much prized as a gem. There was a curious superstition concerning the turquois in ancient times. It was supposed that the gem was in sympathy with its owner, and that it paled when sickness came. It is stated as a fact that some turquoises do change their color, but that the change is owing to temperature or from dampness. An old treatise on precious stones relates of a turquois, that while its owner enjoyed good health the stone displayed remarkable beauty, but when he sickened and died it became dull and assumed a faded, withered appearance. When sold, the purchaser was surprised to see it suddenly assume its former beauty.

Turquois was formerly called turkis or Turkey stone, taking its name, no doubt, from having been first brought from Turkey.

There is a fossil or mineralized bone called odontite, which is often confounded with the turquois. It is called bone turquois, but has but little of the nature of true turquois. The Persian turquois is much prized as a gem. The price varies according to the size and beauty of the stone. A very fine specimen has lately been sold for £400. The beauty of a fine turquois is greatly enhanced by setting it in a circle of small diamonds or pearls.

BULLION SEIZED IN MEXICO.—A dispatch by the steamer *Montana*, which arrived on Saturday, dated La Paz, Lower California, September 26th, states that 19 bars of bullion, valued at $25,000, the property of the Hormiguerra mining company, had been seized by the government authorities for back taxes alleged to be due during the administration of D. O. Mills and Thomas Bell. The amount claimed by the Mexican government was $8,500, which Mr. Brooks, superintendent of the mine, refused to pay, and applied for protection to the United States steamer *Pensacola*, then lying at Prehelingue, near La Paz. The *Montana* sailed before the result was known. No bullion was shipped by this steamer, which will be a disappointment to those holding drafts against the company.

THE London *Examiner* says: "So long as Englishmen prefer the chance of 20 per cent. to the certainty of five per cent., so long will there be periodical times of trouble, and political economy must remain a dreary science while its teachers pretend that they can juggle away these facts by the manipulation of pieces of paper."

THE Centennial anniversary of the founding of Mission Dolores by the Franciscan fathers on the 8th of October, 1776, was celebrated with great eclat last Sunday, with a procession of various civic and military organizations through the public streets, services at the old Mission church and exercises at the Mechanics' Pavilion.

THE Oakland health officer reports that the city water, furnished by the Contra Costa water company, is pure, and further reports that the present unpleasant taste is caused by the large amount of sulphur in the rocks at the bottom of the reservoir.

THE regular amount of square timber used in the Consolidated Virginia and California mines each month is something over 2,200,000 feet.

A MINING stock board is reported to be incubating in Chicago.

[Editorial Correspondence.]

The Centennial at Philadelphia.—No. 16.

There yet remains one of the five main exhibition buildings to which your correspondent has made no reference, and which, for its size, is the most costly of all.

The Art Gallery or Memorial Hall.

This structure is situated just north of and parallel with the main building, and, like horticultural hall, has been built to remain upon the grounds after the exhibition is over. It is intended to serve the double purpose of an art gallery and a permanent monumental memorial of the great exhibition and of the first Centennial occurrence of our national existence. It stands on a terrace six feet above the surrounding level, and over one hundred feet above the Schuylkill river, which flows near its base. The structure is in the modern Renaissance style of architecture. No wood has been used in its construction, the materials being granite, iron and glass, and the intention is that it shall be thoroughly fire-proof. The superstructure is 365 feet in length, 210 feet in width and 59 feet high, standing upon a substantial granite basement 12 feet high, and covering an acre and a half of ground. A beautiful dome, constructed of iron and glass, rises from the center to the hight of 150 feet from the ground, terminating in a colossal bell surmounted by a gigantic figure of Columbia, with outstretched arms, in an attitude of protection, and holding a laurel wreath in her right hand. On each of the four corners of the base of the dome stands an emblematic figure, typifying respectively art, commerce, manufactures and agriculture.

The general design of the building is a right-angled parallelogram, relieved by square towers at each of the four corners, and by a corresponding projecting vestibule in the center of the front or main entrance. The towers at the angles do not rise much above the line of the walls. They are ornamented at each corner with the national eagle—16 in all, with outspread wings and in defiant attitude. The entrance is gained by a broad and easy flight of steps, and made through massive doors of bronze. The steps to the terrace in front of the main entrance are flanked by enormous bronze figures of winged horses, held from their desire to spring forward by women of proportionate mold and ample flowing drapery. The terraces and surrounding grounds are well turfed and bordered with flowers and shrubbery. The whole forms quite an imposing and most fitting entrance to this great palace of art.

The accompanying illustration conveys a very good idea of its construction and appearance.

It is intended that this beautiful structure shall stand as a memorial for generations to come, and that within it shall be shown, free to all, the art treasures of the world—paintings, sculptures, engravings on steel, copper and wood, lithographs, chromos, drawings, architectural designs, etc. So great was the application for space from all quarters of the earth, that the Commission was early compelled to erect an additional, temporary "annex," of nearly equal area to the original building.

Within the Walls.

Nearly every nation on the globe, with any pretence to civilization, is represented within the walls of memorial hall or its "annex." Each country appointed its own art committee of selection, or rather, we should say, rejection; through the gauntlet of whose criticism each work of art had to pass before it could find a place within these walls. England, France, Germany, Spain, Belgium and Italy are all large contributors. We have seen it stated that France alone has sent over 500 specimens of her art in painting and statuary. Italy sends about one hundred groups of statuary. Mexico, Chile and Brazil are also contributors. Nineteen different nationalities are represented, which, reckoned according to space occupied, and rating the United States at 40, stand about as follows: United States, 40; France, 34; Italy, 32; England, 30; Germany, 24; Belgium, 20; Netherlands, 12; Sweden, 9; Spain, 8; Austria, 6; Russia, 4; Canada, 4; Brazil, 4; Portugal, 4; Mexico, 2; Denmark, 2; Norway, 2; Chile, 1; Argentine Republic, 1.

With regard to the relative merits of the several exhibitors, your correspondent will have but little to say, except in general terms, as he does not pretend to any special knowledge in such matters. The rooms are well proportioned and well lighted. A large corridor with a broad entrance runs entirely through memorial hall from north to south, with a narrow, but ample and convenient exit, at its farther extremity, through which the visitor passes direct to the temporary "annex."

The Display of Statuary.

In a central position in the main corridor, Doulton & Co., of Lambeth, England, the largest pottery and china-ware manufactrera in the world, have erected a copy of their famous group, "America," which adorns the base of the Albert memorial in London. As indicative of the care with which everything has been packed, transported and handled, we may remark that not a single one of the thousands of parts of which this group is made up, has been broken. In this central hall there are also some equestrian figures occupying the corners, and several other minor pieces of sculpture. But the chief exhibit in this line is made by Italy in the "annex," and that exhibit constitutes her chief contribution to the art department. The visitor, on entering that building, is encountered at the entrance by a great crowd of figures in marble and bronze, which fill to profusion two large rooms and a long hall or corridor besides. Some of these groups, 100 or more in number, have been pretty severely criticised. They consist of statues, big and little, tragic and pathetic, comic and otherwise, in an almost endless profusion. France also makes several contributions to this department, most of which are highly characteristic of French ideas, and some of which so far transcend American ideas of morals that the short-comings in that direction have been, by order of the Centennial Commission, supplemented by an addition of drapery which bears very little resemblance to that which the artists have so scantily supplied.

The Display of Paintings

Is certainly extensive enough, but the ill-natured critics claim that it is not sufficiently "select." They claim that it would have been better if the commissioners had "weeded and weeded and weeded until enough respectable pictures and statues had been obtained to have filled the main building, (memorial hall,) and then to have rested content." While they acknowledge the presence of some really fine pictures, they assert that the greater number do not rise even to the level of mediocrity—a fault which detracts so much from the general character of the whole, that that which should have been "the crowning joy-giver of the entire exhibition, is really the most disappointing and unwelcome feature about it." We are also told that "after surveying, in other buildings, all that industry, ingenuity and taste can do for the comfort and welfare of man as an animal," when we come to the memorial hall "to seek the springs of delight in seeing how the soul reveals herself in beautiful and solemn ideals clothed in form and color," we turn away in disappointment and sorrow.

Particular Exhibits.

England is generally accorded with the finest display. We are told that she has never before made so full and creditable an exhibition in any foreign country. One room in the English section is devoted exclusively to deceased masters. But we have no space to enumerate.

The United States makes a very creditable display of what has been accomplished by our own people during the first hundred years of the Republic. This exhibition shows that we have in this country a large number of artists of real genius and talent, who are diligent, intelligent and earnest students of nature; and if their efforts lack something of the finer and more conventional qualities that are so much admired in the works of the best foreign artists, they certainly possess qualities of a high order that are peculiarly their own, which fully compensate for their deficiencies. These qualities, moreover, give evidence that when the world comes up to this hall, as it surely will, to celebrate our next Centennial, if we do not rival European in her copyings from the ancient masters, we shall at least be able to present to the nations a distinctive and well established American school of arts, which will confound critics and give us a place which, if it be not higher, will at least be on an equal plane with the trans-atlantic school.

Of Germany it has been offered in apology for what has been considered by some a rather meager display, that there is an exhibition going on this year at Munich, where, for the first time in 30 years, a general display is being made of paintings contributed by German artists. This exhibition has very naturally drawn away from Philadelphia many works of a superior character, which would under other circumstances have found a place in memorial hall.

Conclusion.

But we have no space in this letter to make even the slightest detailed reference to all who have come up with their contributions to this great world's exhibit of art and genius. We have merely space for one or two more brief general references, and we shall leave the art department to the tender mercies of the critics and the more generous consideration of the great masses of the people who, by their daily pilgrimages thither, are recording their favorable verdict and full appreciation thereof.

Considerable criticism, not so much, perhaps, of the hypercritical order, has been devoted to another feature, which has become somewhat prominent in the eyes and ears of those who have been almost daily visitors at the art gallery for months in succession. It is generally understood among artists everywhere, that in cosmopolitan exhibitions of this kind care should be taken to avoid all appearances of offence in matters of international difference. It is held by many that the German commission has exhibited bad taste, if not feeling, in this direction in insisting, against earnest objections, upon the presentation of certain paintings distasteful to French nationality—that they have sought to make this exhibition a "brag" over the Franco-German war, in that they have placed in a particularly conspicuous position not one only, but two large representations of the disaster at Sedan. And what makes the matter still more unfortunate is the fact that the visitor approaches the German exhibit directly from that of France. The consequence has been that an ill-disguised bitterness and bad feeling is frequently manifested between visitors from these two nationalities who chance to meet before these pictures. This feeling is often displayed by fiery glances, and sometimes by low but bitter words.

Then again, our own people have not been altogether innocent of sin in this direction, since Rothermel's "Battle of Gettysburg" is displayed at one end of the United States main exhibition room, while Hicks' "General Mead" occupies a prominent position at the other extremity. It is held that these exhibits lead to a painful "dragging back" to the light, of many things which, on this occasion above all others, should be carefully buried out of sight, if not entirely forgotten.

Of course no exhibition or management can be entirely faultless; but with all its faults and short-comings, this great exhibition of the world's progress in the fine arts is one of the best ever made. Days and weeks may be spent in these two buildings with pleasure and profit, in looking upon and studying the great works of art here presented, which, without this opportunity of bringing them together, would have required of our people years of travel in foreign lands and our own to behold.

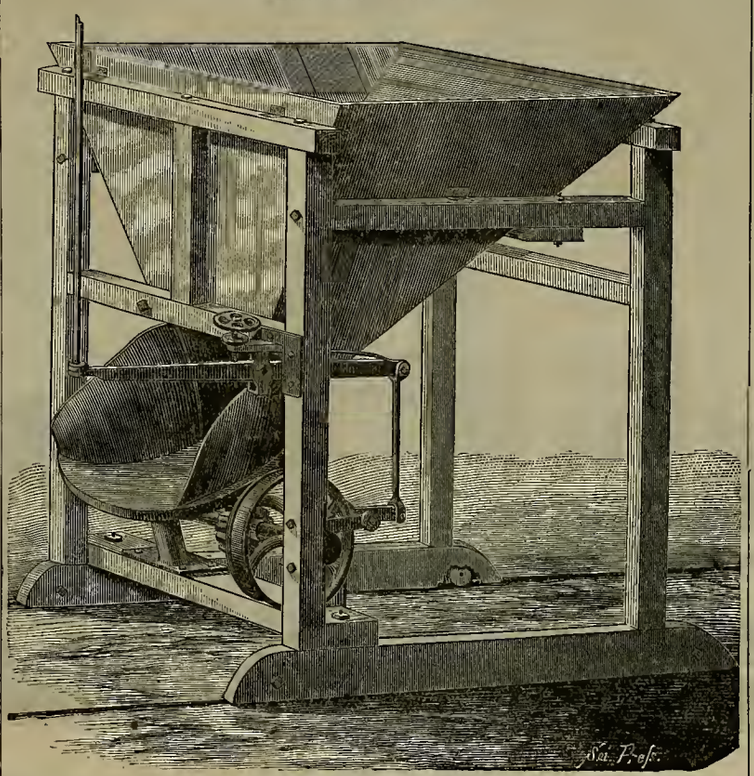
Dewey's new elastic fileholders (black walnut), size of the PRESS, *Harper's Weekly* and *Scientific American*, for 50 cts. Larger sizes, to suit any newspaper, 75 cts. By mail, postpaid, 10 cts. extra. Each with all orders. Patent allowed. Address, DEWEY & Co., Publishers, San Francisco.

$1,000 CHALLENGE ORE FEEDER,

HENDY & COCHRANE'S PATENT,

AWARDED FIRST PREMIUM AT THE TENTH INDUSTRIAL FAIR OF THE MECHANICS' INSTITUTE.



It may be considered as now fully demonstrated, by careful and long-continued experimentation, that the plan upon which a perfect ore feeder must be constructed is that of the *carrier*, and not that of the shaking table. Uniform and accurate feeding is not possible upon the latter plan. The ore must be evenly carried, upon a steadily advancing plane, or table, to the line of discharge, and there simply *dropped*. Spasmodic or jerky contrivances will not answer the purpose.

REFERENCES.

A letter received from the Julian Mill, Newcastle, says, of the Table Feeder: "It is the most perfect Feeder we have ever seen; don't see how eny mill can do without them."——A letter from Mr. C. C. Belding, of Amador County, speaks in the highest terms of them.——Two of the machines were shipped to the Bunker Hill Mill, Amador County.——Mr. Stevenson, of Boston Mill, Gold Hill, Nevada, says they are the best Feeder he has ever seen.——Mr. Lachman, of the Soulsby Mill, Tuolumne County, says they work splendid; could not do better.——Two of the machines were shipped to the California Company, Nevada City.——C. J. Garland, of Mosquito Gulch, Calaveras County, says: "I find them an excellent machine."——S. D. B. Stewart, Supt. Lincoln Gold Mining Company, says they are a perfect success.——C. C. Hewitt, Supt. Keystone Mining Company, says: "I can safely recommend them to all millmen."

We warrant the machines to give perfect satisfaction, and to be a better and more durable Feeder than any other in the market, and will sell them as cheap as any other machine of its class.

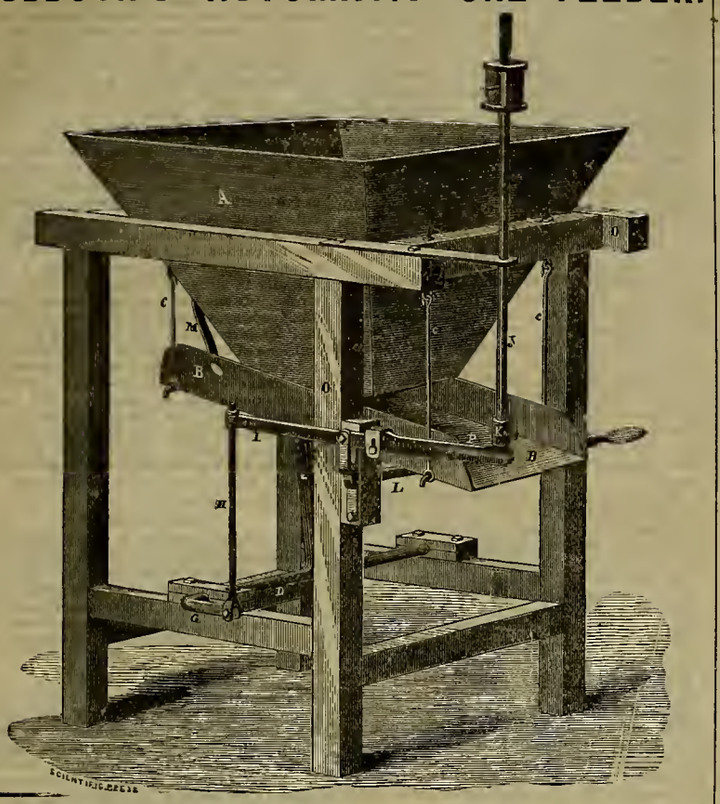
TULLOCH'S AUTOMATIC ORE FEEDER.



The TULLOCH AUTOMATIC ORE FEEDERS have been practically tested during the last year and a half in 40 mills, of from five to 80 stamps each, and have, in every case, given perfect satisfaction. The Tulloch machine is so constructed that the drop of the stamp feede the ore in just such quantities as the stamps require. Each drop regulates the supply required for the next drop, whether it be more or less, and this is the true principle of an automatic feeder. The tray moves longitudinally, and a stationary scraper forces the material forward at each backward movemeut of the tray, thus insuring the perfect feeding of all classes of ore, whether it be dry or wet.

We append a few extracts from the many testimonials which we have received from mill men and practical mining men, of the effectiveness and positive action of the Tulloch Feeder. We do not depend solely upon these testimonials, as we are aware that testimouials are easily secured for almost any machiue, hut the high character of the parties certifying to those herewith given, will establish their value and genuineness:

Mr. Jas. G. Fair has 28 in use; says: I regard them superior to any Feeder with which I am acquainted; I consider no mill perfect without them. Mr. E. R. Burke, Sumner mine, Kern county, has 16: They never get tired; no man living can feed a battery as well; they save us in labor alone $48 a day. Mr. Green, of the Phœnix mill (12), Amador, writes: The first machiue we had is working away; is as good as ever; have not spent a dime on it; in use 14 months; you need fear no competition on wet ores. Mr. W. H. Armstrong, of Consolidated Virginia mill: We are running 60 stamps with your Feeders; they give unbounded satisfaction; they have not cost the company one dollar since starting up. Mr. H. C. Bidwell, Supt. Green Mountain and Gold Stripe companies, Plumas county, writes: From the start they have done splendidly; no trouble whatever; requiring hut little attention; a hoy can manage them; the saving in hoth labor and castings is fully one-half over the old style of feeding hy hand. Mr. Preston writes: I have four of your Automatic Self Feeders, and my mill men each and all say they are the hest they have ever used. They are an improvement on all I have ever seen, heing simple in construction, and good for either wet or dry crushiug; refer to over 40 mills using them; they are guarauteed to give perfect satisfaction. Send for circulars.

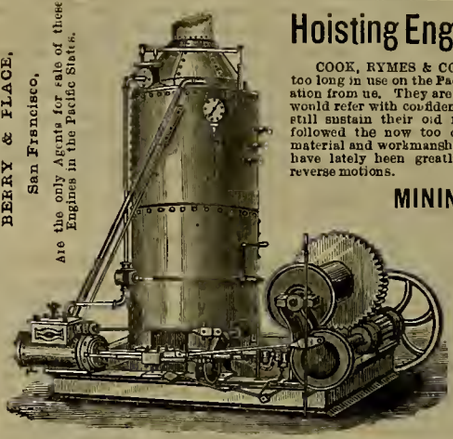
BERRY & PLACE, San Francisco, Are the only Agents for sale of these Engines in the Pacific States.



Hoisting Engines. Mining Engines.

COOK, RYMES & CO.'S celebrated Hoisting Engines have been too long in use on the Pacific coast to require any special recommendation from us. They are well known from Alaska to Mexico. We would refer with confidence to any one of the hundreds in use. They still sustain their old reputation, the manufacturers not having followed the now too common practice of reducing the quality of material and workmanship to compete with cheaper engines. They have lately been greatly improved by adding large drums, and reverse motions.

MINING HOISTING ENGINES.

(Manufactured by the same parties.)

Our new Mining Engine is built from plans and specifications of several of our MOST SUCCESSFUL MINING ENGINEERS, and the result is the most complete

Double Drum Hoisting Engine

Ever built. Their advantages will be seen at a glance by any one familiar with the necessities of a mine. These engines may be seen in use in Ophir, Con. Virginia, Chollar, Enrcka, Niagara, Leviathan, Phil Sheridan, and several other mines on the Comstock Lode. For sale only at

(Continued from Page 254.)

Arizona.

MINING NOTES.—Cor. Arizona *Miner*, Sept. 29: In Peck district operations in the mines are going on quietly and successfully. I learned that Rigge & Hammond are running a tunnel in on the vein on their claim on the Tiger, and have struck fine argentiferous galena ore, and feel well satisfied. In the Bradshaw Basin, Luke & Co. are working in opening both gold and silver veins, and are negotiating with outside parties for the erection of a mill. Coe's work on the War Eagle goes on steadily, and the good ore holds out as well as ever. Goodwin & Co. have been taking out fine silver ore recently from the Lone Jusiper. Myers & Laird are sinking a shaft on the Black Warrior for the ore they take out, and have several tons on the dump, and are sure of good wages. On the Prince the owners are sinking a shaft on the main vein, near the point of discovery, and are following down a streak of the rich chloride ore which has made the mine famous. At the Peck mine the track through the 240 ft tunnel is in good working order, and the company is taking out a good quantity of ore. After sinking the main shaft 70 feet below the tunnel, water commenced coming in rapidly and rose about 10 feet in the shaft, where it now stands, and probably sinking will not be resumed until machinery for pumping is procured. High grade ore was taken out below the water level, the pay streak being over three feet thick, giving great satisfaction to all interested in the permanency of this mine. Three pack trains are now taking ore from the mine to the Aztlan mill, about 25 miles, to fill the contract to deliver 200 tons to the mill. The splendid results of the milling of the ore hae already been published. At Pine Flat, McCloud and others have recently opened a gold mine which promises great results, and were bargaining with parties in town to sink a 60-foot shaft for an interest in the mine. Dan Martin has just been packing some of the ore to the Crook mill for reduction, and it is stated that if the results are good, the mill may be moved to the Flat, which is a splendid location. The Senator mine yields as much ore as usual and Mr. Shipman, superintendent at the mill, is getting more than the ordinary yield of gold from the ore. Banning's new discovery just below Lount's old placer ditch, this side of Hassayampa, looks well, showing at the bottom of the 25-foot shaft a four foot vein of decomposed ore that shows a fine gold prospect in a horn spoon, while the ore apparently carries considerable silver also. The Aztlan mill had piles of silver ore from the Peck, and gold ores from the mines of Willis & Co. and Mr. Mojors, in front of the hatteries as the writer passed. The smeltiug works of Mulvenon & Roach were in full blast, and Martin's pack train was unloading ors at the furnace from the Accidental mine on Lynx creek for flux. The Accidental company are running their four steam arastras steadily and taking out a great deal of gold. Everything considered, the mining interests of this immediate section are probably in a more flourishing condition than ever before.

Idaho.

THE MINES.—Idaho *Avalanche*, Oct. 7: The prospects of the Poorman continue to grow brighter each day. It has, in fact, never occupied a more promising position than it does at the present time. The new ore shute between the 4th and 5th levels is developing splendidly, and gets larger and richer all the time, with the very best indications of its holding out to the surface. A sample of this ore brought down from the mine yesterday by Superintendent Bledsoe assayed at the rate of $612.38 to the ton, of which the gold percentage is $351.63. The Empire continues to look first-rate, and the force employed there have been doing a good business for the past few weeks. There are now 100 tons of ore out ready for shipment, and the work of hauling it to the Elmore mill will commence next week. We are glad to learn that there is a prospect of re-umption of work in the South Chariot at an early day. Favorable progress is being made in removing the water, and the sooner active operations are begun in the mine, the sooner will the parties interested profit thereby. Operations are progressing favorably at the Golden Chariot and the resumption of work has given quite an impetus to business on the hill. In the Belle Peck the tunnel has been completed to the shaft and everything is looking first-rate. The Potosi is prospecting finely, and Mr. Peck is beginning to realize that he has a bonanza here of no mean dimensions.

Montana.

MINING ITEMS.—Helena *Independent*, Sept. 28: Two hundred tons of silver ore was shipped down the river from Benton last week. Sixty thousand pounds of silver ore was shipped last week from the Lete Acquisition spur lode. The citizens of Butte are determined to have more quartz mills and several new ones are projected. Large quantities of copper ore are being taken from the Mountain lode at Butte. The Rainbow lead is furnishing splendid ore for the mills at Butte. The Dexter mill is turning out a weekly allowance of $5,000 in silver bullion. Several new leads have been opened in the Trapper district. Stuart's mill has been running on Luxembourg ore. The Black hills fever has utterly died out in Eastern Montana. Some rich discoveries have recently been made in the famous Willow Creek district. The yield from the claims in the Nine Mile mines is reported very light. Mining operations have closed for the season in Atlanta gulch. The Duck Creek quartz mill has recently made a fine run on ore from the Lone Tree lode. Several new quartz leads have been opened at the head of Montana gulch. Nowlan's furnace, at Jefferson City, has been put in complete order for smelting ores. The Quartz creek mines are said to be doing badly—not paying. There are about 40 miners at work at Cedar creek. Some fine copper leads have recently been discovered on Flint creek, above Georgetown. The drifting diggings on Georgetown Flat pay from $30 to $40 to the set of timbers.

Utah.

BEAVER COUNTY MINES.—Cor. Salt Lake *Tribune*, Oct. 5: The Shauntie smelter is running very successfully, and is now turning out from 80 to 100 bars of bullion every eight hours' shift. The bullion is said by good judges to be the best that has ever been run out in southern Utah. This speaks well for the Old Reliable and Pioneer furnaces, owned by good, square gentiles. A carload is run ready for shipment every 24 hours. 'Frisco, in San Francisco district is looking up. Buildings are being erected on every side. The big calcining ovens will be finished before the 10th of October next, and the smelter will start up then to run until it shuts down for repairs. The Big Horn silver mine shows no signs of weakening. Hoisting works are now being erected on the mine. Milford, at the Beaver river, is now making some show with its fine quartz mill now running, and the new smelting works of Williams & Co. building.

STOCKTON ITEMS.—There is little or no prospect of the Jacobs smelter ever again starting up under the management of Messrs. Longmaid & Co. The Southport mine is only working five men at present. The Chicago smelter is running two stacks, with every prospect of continuing to do so for some time. The Waterman is running hut one.

At the C. & C. shaft a cage containing two cars of ore is hoisted a distance of 1,500 feet in 36 seconds.

There is considerable placer mining going on in the canyons around Gold Hill and Virginia.

Mines Around Eureka, Nevada.

[From our own Correspondent.]

"Gallop apace, ye fiery-footed steeds."

Off from Tyho on a bright September morning, aboard of one of Bell & Co.'s fast coaches, the town of Eureka, 100 miles north, and the largest in Eastern Nevada, was not long in being reached. Right here, perhaps, an acknowledgment is due generally for frequent past favors, on the part of newspaper publishers, proprietors of stage lines or public-spirited individuals, shown to the MINING AND SCIENTIFIC PRESS as one of the great mediums of communication between miner and capitalist, or for its otherwise well-known devotion to the mining and other leading interests. You have doubtless seen and appreciate particularly the recent kindly notices given by the *Reese River Reveille*, the Belmont *Courier* and the Eureka *Sentinel*, all ranking among the most respectable journals of the State. In spite of laying you open to the old charge of the "you-tickle-me-and-I-tickle-you" motive, something, at least, seemed due for acts of kindness apparently so spontaneous, and nothing, it is thought, ought to deter one from a like spontaneous acknowledgment.

After arriving in

The District,

Some attention was paid to the surrounding country rock as well as to the peculiarities of the veins, without arriving at any very settled hypothesis in regard to either. Questions of this kind may well be left to those who have time for closer examination or who make geology a specialty. One thing, however, seems to be well settled, that whether the veins are inclosed between the stratified and unstratified rocks, as in some cases, or wholly in the limestone, or with clay, shale, quartzite, porphyry or feldspar as one wall or in close proximity, whether denominated fissure, contact, pipe, accumulated or what not, they all appear to carry more or less ore, varying from smaller pockets, of richer or poorer quality, to immense chambers or bonanzas of the very highest grade, sufficient in extent and value to have long since attracted the attention of the European market.

The Richmond,

A London incorporation, and by far the most productive and valuable in the district, is situated on Ruby hill, a spur of Prospect mountain, about two and a half miles from Eureka. The vein cropped out on the southwest side of the hill, and has been followed probably in the neighborhood of 1,500 feet on the dip of the vein to the northeast, the workings passing below the crest of the hill, at the depth of about 300 feet.

While it has been technically termed a "pipe vein," it is represented by Rev. Mr. Probert, (the managing director of the company, and to whom I am wholly indebted for this and all other information in regard to this valuable property,) as in reality made up a series of bonanzas of an ellipsoidal shape, with their longer axes in the direction of the dip. The country rock is a metamorphic limestone. The ore consists mostly of an argentiferous carbonate of lead, with nodules of galena interspersed, together with some decomposed gold-bearing arsenical pyrites. Large masses of oxide of iron, more or less rich in gold and silver and with other material, making an excellent flux, alternate with the richer vein-matter, consisting in the main what may be termed the "gangue." Some rarer minerals are also found, always rich in gold, such as mimetite, an arseniate of lead in combination with a chloride.

The ore for the most part is very easily mined and admirably adapted for smelting, requiring no previous fluxing, which is attributable mainly to the very high percentage of peroxide of iron it contains, amounting to upwards of 40 per cent. of the entire contents of the vein. The refining and desilverization process used here is a modification of the Pattinson. The stirring is done by steam, and the entire work of removing the intermediate products is performed by machinery and is considered a decided improvement on the old process.

Five large furnaces of the most improved pattern are kept constantly in operation during the whole running season.

As to the enormous amount of bullion that must have been yielded during its successful run since it was first opened, little can be said, as it is probably only known to those most deeply interested; the total product for the two years ending January 1st, 1876, alone, being definitely ascertained to amount to something upwards of $3,000,000. The mine at present is represented as looking fully as well and to be in every way as promising and productive as at any period of the past. It is looked upon by those best acquainted with its merits as not only one among the grandest silver mines of the State, but in many respects, at least, as scarcely inferior to the finest in the world, the rich bonanzas of Virginia City not excepted; for while the ore is not so rich ton for ton, the ore bodies thus far are believed to hold out proportionately longer. As the following mines are known to be on the same great belt, and in most respects exhibit chimneys of ore similar to those of the Richmond, a concise account as to details will be allowable.

The Eureka Consolidated,

H. Donnelly, Superintendent, lies, in fact, immediately adjoining the above, and has a linear extent of about 1,200 feet. Similar ore bodies are confidently anticipated as the work proceeds, particularly in view of the vast deposits previously encountered in the upper levels. Its prosperous past is too well known to need repetition. It is sufficient to state that the bullion product for last year, as per assessor's books, amounted to $1,384 708. In consequence of a considerable cave in the mine many months ago, the progress of the work was much retarded, and from this and other causes a much smaller amount of good ore has recently been extracted than formerly, perhaps 30 tons or upwards, valued at about $60 per ton in gold and silver, with 20 per cent. of lead.

The company, however, have shown their faith in the value and permanency of their mine by, no longer ago than last spring, putting up hoisting works of the most substantial character, provided with Burleigh drill, air compressor and all necessary appliances for a steady and vigorous prosecution of the work. In addition to this, from 40 to 60 men have for sometime been engaged, chiefly in making further developments, laying open in their progress several bunches of ore, "giving promise of better things" to come as deeper levels are opened, the greatest depth as yet reached being only about 750 feet. It seems to be a general favorite among the citizens, and many are on tiptoe of expectation to hear of a big strike at any day. Taking its past, in connection with all the surroundings, the chances ought to be favorable.

The K. K. Mine

Adjoins the Eureka Consolidated. Accompanied by Mr. Wm. Arrington, the superintendent, and by Mr. Morcom, the foreman, the third, fifth and sixth levels were visited, all exhibiting considerable quantities of good fair smelting ore, and consisting of yellow carbonates running in the precious metals from $50 to $60 per ton, with an average of 10 per cent. in lead, together with deposits of argentiferous galena yielding about $35 in gold and silver and 25 per cent. of lead, sufficiently impregnated with iron to make an excellent flux for the carbonate ores.

Molybdate of lead was frequently met with, at one point in particular in large quantities, showing many specimens of great brilliancy and beauty, enhanced by the fact that they are said to carry with them much of the "needful."

In view of the present developments, the mine is looking exceedingly promising, bidding fair when lower levels are opened of being ranked among the most valuable of the district or State. For the past two weeks the company have been running the furnace of the Silver West mining company, putting through about 40 tons of ore per day, and producing an average of five tons of bullion, worth each some $300, and have ore in store or in sight to supply the furnace for three or four months to come.

Next in order, in a southerly direction and perhaps from 1,500 to 2,000 feet from the works of the K. & K. and Eureka Consolidated, comes

The Jackson Mine,

Said to be the oldest in the district, and which probably gave an impetus to the prosecution of work on other mines in the vicinity, as the richest ore is said to have been discovered in this mine near the surface that has ever been found on the belt, averaging about $400 per ton. Before it was fully demonstrated by the Richmond and other companies that the ore bodies extended to any depth downward, work was suspended and for several years the mine lay idle. About a year ago a very suitable point at some distance east of the ledge was selected for the shaft. Works and machinery admirably fitted for the purpose were erected, with capacity to sink 1,500 feet or more if required. The shaft has already been lowered 460 feet, and two levels run, one of 200 feet and another of 400 feet, each cutting into fine bodies of ore, and represented by Mr. W. H. Shaw, the superintendent, as averaging about $100 per ton in the precious metals, the greater proportion gold. The prospecting is going forward with energy; the ore is being sacked and stored for future smelting, and the prospects are represented as altogether flattering. If Eureka could boast of no other mines than those briefly described, she would still stand very high among the mining districts of the State, but she has besides these a perfect host of locations, extending along what is supposed to be the same great mineral belt the distance of eight or ten miles. As some of these are at present yielding good ore, and others, so far as developed, seem full of promise, they must be reserved for another letter.

A. C. K.

BULLION SHIPMENTS.—Since our last issue bullion shipments have been made as follows: Comanche, Oct. 3, $8,097; Manhattan, Oct. 6, $13,700, Oct. 10, $14,000; Leopard, Oct. 2, $8,954, Oct. 5, $9,000, Oct. 7, 9,000; Humboldt, Oct. 3, $1,065; Rye Patch, Oct. 3. $1,900; Richmond, Oct. 5, $11,164; Chollar-Potosi, Oct. 3, $18,116; Northern Belle, Oct. 5, $11,749, Oct. 3, $10,773; Justice, Oct. 4, $29,000, total for September account, $144,000; Tyho Consolidated, total for September account, $69,647; California, total for September account, $129,-999.18; Consolidated Virginia, total for September account, $865,813; Total September account of Manhattan mine was $296,000.

The Burleigh Air Compressor at the Crown Point Mine.

In the deep workings of the Comstock the most potent forces of nature are called into requisition, and among the most effective of these is compressed air. Steam can be sent through pipes down into a mine to work small engines below the surface, but only to a very limited extent. The capacity or extent of compressed air in this respect, however, has not yet been ascertained. By means of the powerful air compressors now in use, this great motive force can be sent down through pipes, from the surface to the lowest depths of our deepest mines, and made use of to a greater possible advantage than any other known agent.

The Compressor.

The Gold Hill *News* has the following description of the large new Burleigh air compressor at the Crown Point works, which has been called into requisition to drive drills, pumps, hoisting and blowing engines, etc., at the lower levels of the mine. It is now in full and successful operation, furnishing much more power than is at present required, as it is simply used to drive a couple of Burleigh drills and a water pump in sinking the main incline below the 1700-foot level, the compressor running less than half the time to do this. Its sphere of action will shortly be enlarged, however. This

Burly Giant

Is size No. 7, of the Burleigh air compressor, the best and most effective of all machines of its kind yet invented or perfected. It stands at the north side of the works, and occupies but comparatively little space, being 6½ by 10 feet in size at the base, and 13 feet high. The engine portion of it is known as the Putnam balance poppet valve cut-off, with a steam cylinder 18 inches in diameter, having a 24-inch stroke. It has two air compressing cylinders, single acting, each with a diameter of 24 inches and 20 inch stroke, delivering one and a half millions of cubic inches of free air per minute. A boiler pressure of 80 pounds of steam, with the engine cutting off at quarter stroke, will give 80 pounds of air pressure. The receiver or reservoir for this compressed air is of the heaviest boiler iron and is 48 inches in diameter by 16 feet in hight. The machine has all the latest improvements, with a neat gallery to get at the upper works of it conveniently, iron sinirway, railings, etc.

Solid Weight.

The solid ponderosity of this condensed and condensing giant may be judged by the fact that its total weight is 45,000 pounds. It is all of cast and wrought iron, the bed-plate and crank shaft alone weighing 11,000 pounds, and being the heaviest single piece in the machine. The fly-wheel is all in one piece, and weighs 8,000 pounds. This

Splendid Machine

Was manufactured for Parke & Lacy, of San Francisco, sole agents for the Pacific coast, by the Putnam machine company, Fitchburg, Mass. They have already furnished machines of the same size and description for the Ophir, Belcher and Dayton mining companies in this State, to say nothing of smaller compressors for other mining companies along the Cometock range. They have also furnished one of the same size for the Mariposa and land mining company, in California, for use at the Bear River tunnel. The demand for them is constantly on the increase, and they have several other machines ordered or on their way across the continent. As we have before stated, these machines are the most perfect and effective of the kind now in use, the principal credit for which is due to Mr. Lyman Parke, who first introduced them here, and whose mechanical brain and ingenuity has constantly suggested improvements until they have at length attained their present wonderful power, popularity and admirable efficiency. The one at the Belcher mine has been in constant use for the last nine months, without costing a dollar for repairs, showing that the first cost is everything, and also bearing very practical testimony as to the excellence and perfect durability of their construction.

Coast Railroad Items.

The Southern Pacific railroad engineers are surveying the route of the road from Goshen toward Mussel slough, doubtless with a view of making the main line connection from the Salinas valley to the San Joaquin.

ONE of the locomotives on the Central Pacific railroad ran into and demolished a caboose and three flat cars and went down an embankment near Pleasanton, October 6th. James Butler, Jr., of Livermore, a passenger, was slightly injured.

THE San Diego *World* says that the people of San Bernardino propose to build a railroad to Colton at a (probable) cost of $20,000 to $55,000, and to continue it to Mound City, so that when the Southern Pacific railroad has completed its line between Mohave station and the San Gregorio pass, it may be induced to connect at San Bernardino.

WOODWARD'S GARDENS embracee an Aquarium, Museum, Art Gallery, Conservatories, Tropical Houses, Menagerie, Seal Ponds and Skating Rink.

LADIES who for years have depended on all manner of powders and cosmetics for giving them artificial complexions, now find that GLENN'S SULPHUR SOAP supplies them with pearly skins and rosy cheeks, elicited by the gentle stimulation of nature. Sold everywhere.

PATENTS & INVENTIONS.

A Weekly List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

FOR WEEK ENDING OCTOBER 3D, 1876.

ELECTRIC COUPLINGS FOR TRAIN TELEGRAPHS.—Andrew Ryder, Oakland, Cal.

CIGAR PIPES.—Isaacher A Heald, S. F.

MACHINES FOR GENERATING EARTH AUGERS.—Ellery M. Hoagland, Watsonville, Cal.

WATCH CHAINS.—John J. Kohrbeck, S. F.

REISSUES.

HAY AND GRAIN ELEVATORS.—Thomas Powell, Stockton, Cal.

——The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

THE Main Feather River mining company, of Butte county, have commenced sinking their shaft The contract has been let to Nevada miners. It is the intention of this company to tunnel under the bed of the river and take the gravel from under the river.

DRIFTING from the C. & C. shaft, to strike the Consolidated Virginia and California ore body at a depth of 1,650 feet, was commenced on Monday. The distance from the shaft to the ledge is about 490 feet.

THE product of the Chollar-Potosi mine last week was 386 tons ore; amount sent to the mills, 587 tons, assaying $32 per ton. Bullion product for September, $59,769

THE American ships in this port at present find great difficulty in getting crews.

ISSUED OCT. 1st, 1876.

Testing and Working Silver Ores.

The above is the title of an illustrated work of 114 pages, for miners and prospectors by Chas. H. Aaron, which has just been issued by Dewey & Co. Mr. Aaron has managed to give many useful hints and suggestions, free from all technicalities, and in such a style as to be easily comprehended. It is written for the miner, with no chemical symbols or metallurgical technicalities to confuse those who are not chemists or metallurgists. The following summary of the contents of the work will give an idea of its scope:

Under the heading of the first chepter, 'Testing Ores for Silver," we find paragraphs on ore formation, test for silver, with heat and water, acid or blow pipe. In speaking of testing for a process, the extent and richness of ore is considered, smelting ores, selecting and working sample, appliances for testing, roasting, etc. Under the head of "Working Ores" the author describes Aaron's process, has something to say of superheated steam, preparation of dichloride of copper and protochloride of copper, use of copper and iron, quantity of chemicals, carbonate of lime, chloride ores, amalgam, Patchen's process, etc. He also describes the methode of working roasted ores, treatment of base metals, stirring, heat of furnace, want of sulphur, etc. Under the head of "Leaching Processes" are the titles, Smelting, Mexican process, Kroencke's process, Chilean processes, etc. Under "Pulverizing Machines" are described the arastra and its construction and operation, stamp batteries, screens, Crooker's trip-hammer battery, Paul's pulverizing barrel, Kendall's battery, Noica's pulverizer, a cheap rock breaker, etc.

In speaking of smalgamators the author describes a cheap amalgamator, grinding the ore, directions for making a barrel, preventing mechanical wear, use of quicksilver, copper in bars. Freiberg barrel, cheap barrel, trough, barrel on rollers, Aaron's amalgamator, separator, etc.

He describes an improved retort, roasting furnace, furnace tools and furnace building. Among the miscellaneous mention may be found Aaron's leaching apparatus, with two or three different arrangements, a smell mill, sampling tailings and setting tanks, dichloride of copper, etc.

The book is serviceable one for miner's and prospector's use. Price, post free, (in leather,) $2.00. Address Dewey & Co., MINING AND SCIENTIFIC PRESS, 224 Sansome street, San Francisco.

Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

Eagle Quicksilver Mining Co.—Location

of works, Santa Barbara county, Cal. Principal place of business, San Francisco, Cal.

NOTICE is hereby given, that at a meeting of the Board of Trustees of said company, held on the 30th day of September, 1876, an assessment (No. 9) of two hundred and fifty ($250) dollars per share was levied upon all the shares of said company, payable immediately, in gold coin of the United States, to the Secretary, at his office, rooms 5 & 6, No. 302 Montgomery street, San Francisco, Cal.

Any shares upon which said assessment shall remain unpaid on Wednesday, the 24th day of November, 1876, shall be deemed delinquent, and will be duly advertised on Saturday, the second day of December, 1876, for sale at public auction, and unless payment shall be made before, will be sold on Monday, the fourth day of December, 1876, as provided by the articles of agreement of said company, to pay the delinquent assessment, together with cost of advertising and expense of sale. By order of Board of Trustees. WM. H. WATSON, Secretary.

Cincinnati Gold and Silver Mining Co.

Location of principal place of business, San Francisco, Cal.

NOTICE.—There are delinquent upon the following described stock, on account of assessment, levied on the 29th day of August, 1876, the several amounts set opposite the names of the respective shareholders, as follows:

Tenney, John, Trustee	159	100	10 00
Tenney, John, Trustee	100	138	13 80

And in accordance with law, and on order of the Board of Directors, made on the 29th day of August, 1876, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the office of the company, No. 535 California street, San Francisco, Cal., on the 16th day of October, 1876, at the hour of one o'clock P. M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale. WM. SMALL, Secretary.

Office, room 2½, No. 535 California street, San Francisco, Cal.

Mariposa Land and Mining Company

of California. Location of principal place of business, San Francisco, Cal. Location of works, Mariposa county, Cal. Notice is hereby given, that at a meeting of the Board of Directors, held on the seventh day of September, 1876, an assessment, No. 7, of one dollar ($1) per share was levied upon the capital stock of the Corporation, payable immediately in United States currency, to the Secretary, at the office of the Company, room 33, Nevada Block, No. 309 Montgomery street, San Francisco, Cal., or to the Assistant Secretary at the office, No. 9 Nasean street, New York, N. Y.

Any stock upon which this assessment shall remain unpaid on the ninth day of October, 1876 will be delinquent, and advertised for sale at public auction; and unless payment is made before will be sold on Monday the thirtieth (30th) day of October, 1876, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors

LEANDER LEAVITT, Secretary.

Office, Room No. 33, Nevada Block, No. 309 Montgomery street, San Francisco, Cal.

POSTPONEMENT.—The day for the sale of delinquent stock on above assessment is postponed till November 6th, 1876. By order of the Board of Directors.

LEANDER LEAVITT, Secretary.

Mariposa South Mining Company—Location

of principal place of business, San Francisco, Cal. Location of works, Spanish Belt Mining District, Nye county, Nev.

NOTICE.—There are delinquent upon the following described stock, on account of assessment (No. 1), levied on the eighth day of August, A. D., 1876, the several amounts set opposite the names of the respective shareholders, as follows:

THE O'HARRA

CHLORIDIZING FURNACE.

Guaranteed to Chloridize from 85 to 95 per cent. of any gold or silver ores that are not more profitable for smelting. Will also desulphurize ores and put them in proper shape for working in cupola furnaces.

Cost of Roasting and Chloridizing by this Process:

Two cords of wood at $6	$12.00
Two firemen at $4	8.00
1500 lbs of salt at 1½c	22.50
Wear of shoes and power	1.50
Cost for 15 tons	$44.00
Cost for one ton	2.93½

In a furnace of three or four times this capacity the cost is decreased by 20 per cent.

This furnace is now working successfully at the Poe Consolidated Co.'s mines, in the Peavine District. For further information, apply to

D. J. O'HARRA,

Reno, Nevada.

Diamond Drill Co.

The undersigned, owners of LESCHOT'S PATENT for DIAMOND POINTED DRILLS, now brought to the highest state of perfection, are prepared to fill orders for the IMPROVED PROSPECTING and TUNNELING DRILLS, with or without power, at short notice, and at reduced prices. Abundant testimony furnished of the great economy and successful working of numerous machines in operation in the quartz and gravel mines on this coast. Circulars forwarded, and full information given upon application.

During my absence in Oregon, and till further notice, all orders for the above Saws or Saw Teeth addressed to D. L. EMERSON, No. 1 Spear street, will receive prompt attention by my agent, Wm. L. Jones.

We have a large number of Saw Teeth and Saw Bits—about 15,000—now on hand, and are receiving new invoices to supply the demand.

D. L. EMERSON.

PAUL'S DRY PROCESS.

I am now prepared to test gold and silver milling ores in any quantity from FIVE POUNDS to FIFTY TONS, and assert my ability to prove, by machinery NOW UP, and open to public inspection, and by practical testing of its merits, that I can increase the yield of gold mills, working wet batteries and copper plates, from FIFTY to ONE HUNDRED PER CENT., and on silver ores a much larger percentage than by pan amalgamation, and at less expense than any known method of working quartz well; and from some "gold" ores of California can extract more silver extra with the gold, which is now lost, than all the expenses of mining and milling. Having had 25 years' practical experience in milling gold and silver ores, I presume to know whereof I speak, and AM PREPARED TO PROVE ALL I ASSERT. These mills, for simplicity, cheapness, practicability and perfection in working, challenge the skill of the age to surpass. Quartz miners who desire to investigate and have their ore tested, are invited to a critical examination of the machinery and process, and can receive permits for examination, particulars and pamphlets explaining process by calling at my office. ALMARIN B. PAUL.

SCREENS

Several first premiums received for quartz mill Screens, and perforated sheet metals of every description. I would call especial attention to my SLOT CUT and SLOT PUNCHED SCREENS, which are attracting much attention and giving universal satisfaction. This is the only establishment on the coast devoted exclusively to the manufacture of Screens. Mill owners using battery Screens extensively can contract for large supplies at favorable rates. Orders solicited and promptly attended to.

ANGELL'S CHARCOAL DENTAL SOAP for Whitening and Preserving the Teeth. J. W. ANGELL, Prop., San Francisco

The ALLEN ENGINE GOVERNOR.

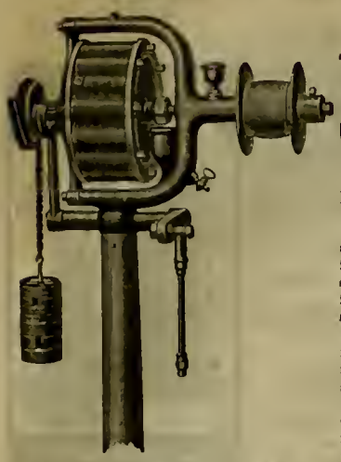

Fig. 1. For Variable Cut-Off Engine.

Uniform Speed in the Working of Steam Engines.

THE SIMPLEST AND MOST EFFICIENT GOVERNOR YET CONSTRUCTED.

ECONOMY and SAFETY.

Especially Valuable with Adjustable Cut-Offs. Capacity of Machinery Increased by Accurate Regulation of Speed.

Direct Saving of Fuel—Great Increase in Power of Engines.

The high rate of speed used acts advantageously in making the Allen Governor very sensitive; and all parts being inhricated, it works with the smallest amount of friction.

The speed of the Engine is maintained equally, without reference to the variations in amount of work being done.

The peculiar action of the Governor, which allows the use of a valve of large area, thereby admitting to the Engine cylinder the greatest possible boiler pressure at each stroke of the piston, has produced astonishing results by being attached to old engines, greatly increasing their power or effecting a direct saving of fuel, and in hundreds of instances doing both. In running an engine with the Allen Governor with high or low pressure of steam and with all variations of power, the throttle is opened wide in the morning and remains so until closed at night, thus relieving the engineer from all labor and care except keeping the engine oiled, and giving him a great deal of time for other duties.

Allen's Patent Governor Valve is constructed with a double disc in a tubular frame, and is perfectly balanced, there being no spindle as in the ordinary throttle valve to interfere with its equilibrium. The valve is moved by means of a lever, and is opened and closed by a rocking motion of a steel spindle, which is covered with brass, insuring the greatest possible durability.

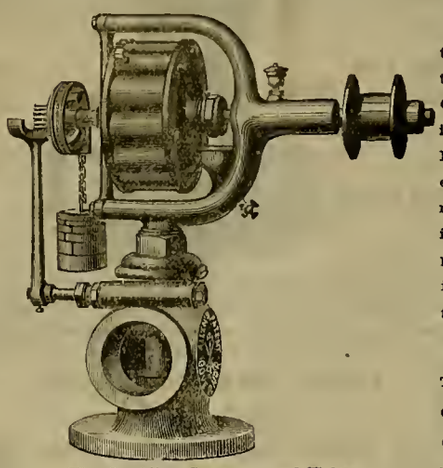

Fig. 2. Allen Governor and Valve.

We have Numerous testimonials from parties who have used this Governor, and watched its workings critically. In all cases the Governor has made the various engines to which it has been applied produce the most profitable results ever obtained.

Fig. 3. Section of Allen Governor.

PARTIES INTERESTED IN STEAM MACHINERY SHOULD EXAMINE THE ALLEN GOVERNOR, WHICH IS NOW INTRODUCED ON THIS COAST FOR THE FIRST TIME. FULL INFORMATION CONCERNING IT CAN BE OBTAINED FROM ILLUSTRATED DESCRIPTIVE CIRCULARS WHICH WILL BE SENT ON APPLICATION. Address,

Scientific and Practical Books on Mining, Metallurgy, Etc.

Published or issued, wholesale and retail, by DEWEY & CO., MINING AND SCIENTIFIC PRESS Office, S. F.

BY GUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST.

Roasting of Gold and Silver Ores, and the Extraction of their Respective Metals without Quicksilver. 1870.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus.

It is a work of great merit, by an author whose reputation is unsurpassed in his specialty.

Price $2.50 coin, or $3 currency, postage free.

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequaled by any other published, embracing the subjects treated. Its authority is highly steemed and regarded by its readers; containing, as it oes, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot he found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest valne. PRICE REDUCED TO $5.

The Large Circulation of the MINING AND SCIENTIFIC PRESS extends throughout the mining districts of California, Nevada, Utah, Colorado, Arizona, Idaho, Montana, British Columbia and to other parts of North and South America. Established in 1860, it has long been the leading Mining Journal of the Continent, its varied and reliable contents giving it a character popnlar with both its reading and advertising patrons.

More of the Mines and Machinery of Eureka.

[From our own Correspondent.]

Before noticing the mines, a brief description of whet promises to be

A Very Valuable Improvemant

Is thonght advisahle, the invention of Captain T. J. Taylor, of Enreka. As it will probebly ba illuetrated and fully described in the colnmns of the PRESS, more than a mere mention would he ont of place. The improvement has reference to the construction of smoke-stacks for smelting and other fnrnaces, end consists mainly in the two following points: Firet, an angular chamber with the diameter of the center greetly in excese of the npper end lower ends of the steck. Second, an exit pipe projecting slightly downward into the chamber, by means of both which devices the weste prodncts of the fnrnace are effectnally arrested and thrown hack to he again snbjected to the action of the flames. Nor is this all. The finer particles are compelled to run the gaunlet the second time by coming in contact with a final exit pipe, provided with an annnlar deflecting piece, performing an office similar, and meking a nice supplement to the arresting chemher. It wes recently pretty thoroughly tested on 18 tons of dnst from the Alta's furnece and also on 92 tons of ore from the Matamoras mine on Prospect mountain, together with whet slag and refnse could he gathered np eronnd the fnrnaca which lately became the property of the Metemoras company. After a run of only 21 days, a clean-np was mede, which left a net prodnct over all expenses of ahout $14,000, the result heing attrihnted chiefly to the effective work of the dnst trap, as styled hy the patent office. The highest assay from the slag after working was only $3 per ton, while not a trace of metal of any kind was fonnd in the dnst.

A Large Undertaking.

As steted in my last letter, the Richmond and severel other large mines of the district are sitnated on a spnr of Prospect monntain. Owing to this and to the fact that rich croppings had heen fonnd not only on the snmmit, but also along both the eastern and western slopes, almost the whole mountain has heen located and prospected to some extent for several miles in length, the ledges, it is seid, dipping in either direction towards the center of the ridge. Indnced by facts such as these,

A Tunneling Company

Has heen organized and operations commenced in earnest hy some of the most snbstantial men of Eureke, numhering such men as Mr. H. Donnelly, snperintendent of the Eureka Consolidated, Dr. Bishop, Messrs. Shoenbar, Herruh, Haskel, Baker and many others, with Hon. T. J. Reed as superintendent. The ground was loceted under the mining lawe of 1872, and a claim made to 3,000 feet in length and to all the blind lodes that may be discovered. It ie looked upon here as one of the grandest enterprises of eastern Nevada. It is intended to he eight feet high and eight feet wide, with donhle tracke, and has already advanced from 40 to 50 feet, giving some indicetions of approaching ledge matter, and on the anthority of Captain Foley, who lives near the mouth of the tunnel, it will cut at leest ten different ledges in its coorse. The first reeched will he

Tha Tyndall,

The property of the Captain, and so designated ont of reepect to the celebrated English scientist of the same neme. This claim is situated near the western base of the mountain, has been opened by two shafts, 60 and 80 feet respectively, showing a very wide vein, and some ore that runs into the thousands, bnt giving an average working of ahout $300 per ton. It will he ent by the large tnnnel at the depth of 200 feet, others at 1,000 feet and some at 1,500 feet deep and npwards. In addition to the Matamoras and Tyndall that will be prospected by the tnnnel, a few more may he mentioned, that lie either on or not far from its line, snch as the

Kit Carson,

Which has made three shipments of ore, averaging $300 per ton; first class going neerly $400. Ore said to need no flux and running ahout 60 per cent. in leed.

The Cloud

Shows a ledge all tha way down to the depth of 170 feet, working as high as $200 per ton in silver and lead.

The Silver Brick,

The property of William Gillen and others, of Eureka, has been opened sufficiently by tunnel and incline from end of same to find a good chimney of ore from seven to eight feet in width, giving assays from $130 to $140 per ton.

The New Law,

Belonging to Mr. Shoenhar and others, adjoining the Matamoras on the north, hes a shaft 600 feet deep, showing ore represented to he rich both in gold and silver.

The Fourth of July, at the heed of New York canyon, owned by Mr. Driesbech end others of Carson City, has a tunnel 800 feet, striking tbe ledge at the depth of about 400 feet from surface, finding a large body of low grade ore, with a streak of high grade from 12 to 18 inches in thickness, estimated to go from $100 to $120 per ton.

The Diamond, one-fourth of a mile from above, P. McGinness proprietor, has an incline which hes followed tbe ledge from tha surfece 200 feet, meeting with good pay ore, some of it very rich, from $500 to $600 per ton. The ledge so fer small, from 18 inches to two end-a-half feet, the ore improving in depth. On the Eestern slope of the mountain are the Patriot, Bald Eegle and several others which are opening np finely.

The Elise,

In thie neighborhood and on the line of the large tunnel, hee been opened by shafts, drifts and a tunnel 300 feet, several good bodies of ore heing fonnd, peying from $70 to $250 per ton, the amount extracted thus far about paying for expenses of development.

Two or three milee in a southerly direction from the Richmond and the Enreka Consolidated, and supposed to he on or near the seme belt, there are several very good mines, the first being the Atlas, which ie eeid to have paid exceedingly well. It ie opened hy an incline 300 feet, and drift from foot of same 700 feet, to connect with a new sheft which is now down 250 feet, with 80 feet mora to sink to make connection with the drift.

The Connelly

Hes a tunnel 230 feet in length, this end connecting with snrface by a shaft 140 feet, the same extending below the tunnel level 150 feet. Two drifts have heen run from the 140-foot level, one of 70 feet and another 116 feet, from which a considerahle quantity of ore has heen taken thet milled on an averege from $80 to $120 per ton.

The company is now putting up machinery with capacity to sink 1,500 feet, everything in the most solid and snhstantial form. The snperintendeut, Mr. John Potter, was sent here by the British mining and milling company, of London, for the pnrpose of developing this mine, together with the Indnstry, the Page, the Corwin, and whet is known as the Meryland group. In connection with the property there is a fine 20-stamp mill, provided with Stedefeldt furnace and all the nsual and necessary appliances for effective work.

Still fnrther south, near the seme range, is

The Hamburg,

Covering 2,000 feet in length by 350 feet in width, the company owning in addition to this, on Prospect mountain, the Union, the Gelloway and Rohert Emmet. The Hamburg has been opened by what is known as the Friday shaft, 400 feet, and the deepeet, from which a drift is now heing run southeast to tap the ledge. There are two other shafts 320 feet epert, the Southern Pecific, 100 feet, and the South shaft, 100 feet, a drift from Southern Pecific, 40 feet.

The developments show a body of ore from surface down eight feet wide, mostly carbonate. Ninety tons of second class worked $104 per ton, and 220 tons of first cless went as high as $128. The ore is very easily smelted, requiring no flux, and there are at present on the dump about 1,000 tons, believed to be fully as good as the above. From the shepe of the hill and general surroundings, teken in connection with numerous cross-veins fouud at this point, indiceting at one time an immense internal force, tbe location was looked upon as one of the hest for encountering large chimneye of good ore ae the work progresses. A greet future may he safely predicted for this and probahly a number of other mines in this same vicinity.

A. C. K.

RYE PATCH.—A correspondent writes from Rye Patch district, Nevada, complaining that our correepondent vieited that locality, and promised to puhlish some notes of the mines, which, the writer saye, he failed to do. If our friend will look in the MINING ANN SCIENTIFIC PRESS of August 26th, he will see that Mr. KNOX complied with the promise he refere to, and gave some descriptions of the district and its mines. The writer of the letter must have overlocked thet issne of the PRESS.

[Copyrighted.]

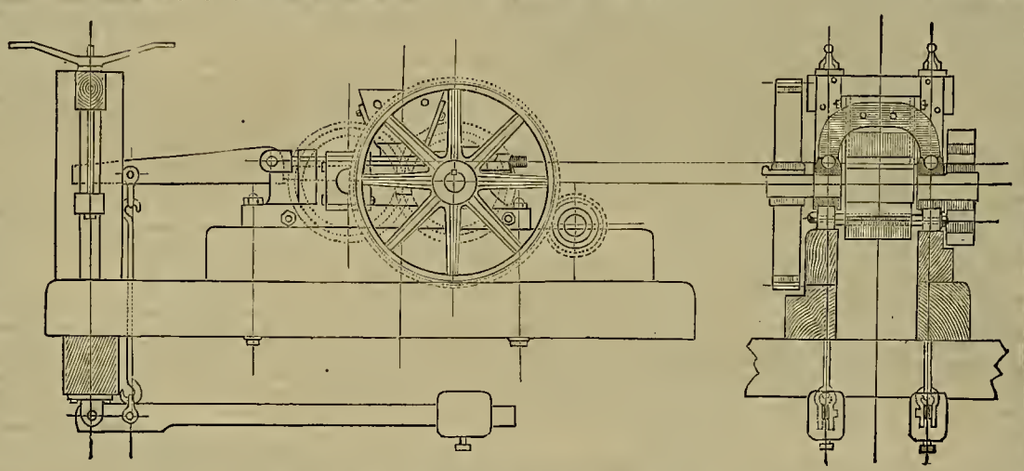
Mechanical Ore Concentration and Separation.—No. 9.

[Written for the PRESS by FRANCIS F. M. CAZIN, M. E. Santa Fe, New Mexico.]

Rollers.

In almost every case it will pey to separata the smaller sizes hy screening them from the coarser sizes, before pessing the latter to the rollers, because rollers not only work best hut also preserve their face in good order when fed with rock of nearly equal size. Rollers have been introdnced of a great many different patterns, differing essentially in the way in which they ere compressed, one against the other, when doing work. Lever power, hy single or a componnd lever, is the most correct, hecanse with an arrangement to arrest the motion of the lever, and by regnlating or removing the weight, especially if it is of the componnd description, the smallest veriation as to siza to be ohtained can be given at option. In using india rnhher buffers or steel springs, there is no way of accommodating the pressure to the reqnirements of the work.

The accompanying illnstration shows the rollers in the F shape recommended. The left hand figure is a side and the right an end view, on a scele of half an inch to the foot. Crusher and rollers will, in most cases, complete the rock hreaking arrangements, and only in those cases referred to, as where the metal or mineral is so finely disseminated in the rock that it is required to pulverize the same in order to lay metallic particles and rock particlee separate, the introduction of stamp mills will be needed the same as in the working of gold-bearing quartz.



ROLLERS WITH COMPOUND LEVERS FOR CRUSHING ORE.

Coal Fields in Western Wyoming.

In accordance with the reqnest of our traveling correspondent, Mr. Hnrd, of Elko, Nev., sends us tbe following hrief deecription of the vast coal fields in western Wyoming:

The Mammoth Sandstone ledge is situate in Uintah county, Wyoming Territory, directly north, 22 miles, from Carter station, on the U. P. R. R.,—eesy of access from said road. The mine is one of the largest (if not the largest) in the world. From actual measurement we find one vein 70 feet, one of 60, two of 50, one of 40, two of 24, and eight of 16 feet, in sandstone, free from any impurities. No iron or shale in the vicinity. The coal is bright and will not soil the finest cembric, snd is pronounced by experts—cannel coal. It hes been assayed by Professor Pontez of Omeha, Professor Britton, of Philadelphia, and Professor McVicker, of Salt Lake City. They find it to coke 53 per cent., and it leeves only 1½ per cent. ash. The company was incorporated May 16th, 1876, at Selt Lake City, with a capital of $4,000,000, and loceted 8,000 acres. The mine is in a bold bluff, and all the veins are above the surface of the surrounding country. They hope to induce capital to assist in building a railroad to the mines to connect with the C. P. road at Ogden or at Corinne. This road would lead through vast pine regions, and create an industry in the lumher trade. This, with coal, will revolutionize the northern part of Bro. Brigham's domiuione.

AT Gold Run, Placer county, the Miners Ditch Co. is having a new string of extra heavy large pipe made to convey water from the ditch down iuto the Indiana Hill claim.

CORRESPONDENCE.

Tybo District.

Its Growth and Metallic Productions.

EDITORS PRESS:—Following up the thread of my remarks of last week, I will now try to redeem the promise then made to your readers, by describing in detail the mines and reduction works of the Tybo Consolidated company, and by giving such other information as may be of intereat to the dear public for whose especial benefit I chronicle these matters. But before I plunge into the subterranean recesses of the Two G mines, I will first briefly sketch the history and geographical extent and location of the

Tybo Mining District,

And will also glance retrospectively at the Two G and its companion mines, which compose the series forming the property of the aforesaid company.

The word "Tybo" is derived from the Shoshone dialect, and signifies "White Man's district," according to the interpretation of those best skilled in that euphonious language. The camp, whose altitude is about 6,000 feet above tide water, lies embosomed amidst the northeastern slopes of the Hot Creek range of mountains. It is distant from Eureka 100 miles due south, 12 miles south of Hot Creek, 25 northwest of Reveille district, wherein is located the once famous Gila mine, and 35 miles southeast of Belmont, Nye's county seat. It is kept in communication with the outside world by a semi-weekly line of stages, run by T. J. Bell & Co. from this point to Eureka and Belmont. The fare to and from the former place is $20, and to and from the latter, $10. We have no regular mail service, which, considering the population and the importance of the locality, is a matter of some surprise. We are, therefore, indebted to the good offices of the stage company for the transmission of our letters from Eureka to here. But to return from this digression. This district was inaugurated in May, 1870, soon after the discovery of the mines now owned by this company. It was originally named

Empire District,

But it was subsequently given the name which it now bears, and by which it will be known in the mining annals of the State. The district has an area of ten square miles. Its geological formation is of limestone and porphyry. Between these two distinctive belts it is that the veins of the district are found encased; the former, in the character of a silicious lime, forming the banging wall, and the latter the foot wall. In many places below the surface a kind of slaty stone, much resembling schist in cleavage, is met with in the stratification. There is also much of the ferruginous matter found here, in the immediate vicinity of the argentiferous galena ores, that are so often found overlying in regular strata similar ore deposits in Eureka and elsewhere.

The Two G,

Which is the only one of the original locations that is now being worked, courses obliquely across the northeastern slopes of Pucipico mountain, whose shaggy crown rises 1,600 feet above the canyon, wherein stands the town and the works of the company. Its croppings, which are easily traceable above the surrounding formation, have been traced and located on for over 5,000 linear feet. Pucipico canyon, which courses east and west, runs through that portion of the property comprised in the Casket, Lafayette and Crosby. The main hoisting works of the Two G stand on the southern verge of the canyon. The whole property is opened both by shafts and tunnels. The three latter have penetrated the hill for several hundred feet along the course of the ledge, which developed finely as far as followed. The upper sections of the mine were successfully worked by means of these tunnels or adit levels. From No. 1, or lower tunnel, the mine was opened to the depth of 120 feet, of two levels, by means of winzes; but since this method of working and ore extracting was found to be both too slow and too expensive, the present shaft, of three compartments, was commenced about 160 feet northeast of the lode, which it has been calculated it will cut at or about a depth of 1,400 feet from the surface, at point where said shaft stands. Allowing for the inequalities of level in the configuration of the grounds, the apex of the lode has an elevation of nearly 250 feet above the shaft, whose dimensions are 10 by five feet in the clear, thus allowing sufficient space for two working and a pumping compartment. But the Two G mine alone will have paid to its shareholders, in dividends, many thousands of dollars ere the aqueous element becomes troublesome. A 1,000-foot shaft may probably cut a water channel, and the chances are that even greater depth will have to be reached before water is tapped. The

Hoisting Apparatus

Are in all respects first-class, and are considered ample for elevating from a depth of 1,000 feet or more. The engine has a capacity of 50-horse power; the cylinder has a 12-inch diameter and a 24-inch stroke, and the reels, of which there are two, are each 34 inches in the clear, and are provided with suitable brakes, etc. The whole are covered in by a substantial frame building, and in case of fire a plentiful supply of water stands in a tank hard by, which, from the great pressure, would do most effective service in drowning out an incipient blaze. We will now descend to the nether gloom of the Two G and see what we will discover therein.

At a depth of 130 feet from top of shaft, the first station occurs. It is quite roomy and cut out of the solid rock, as is the whole length of the drift which connects the shaft with the ledge. This drift, which is 140 linear feet, is denominated the

Fifth Level

From the out-crop of the lode, which, from this point, has an elevation of not less than 450 feet. On this level the ledge has been followed along its course to the east of south 740 linear feet, the entire extent being run through a fine grade of ore; and it is a noticeable fact that neither break nor dead space occurs in the whole distance, which is saying much for the character and uniformity of the vein. The ore encountered at this depth is not only rich in the precious metals, but it also carries more lead and finer and richer carbonates and oxides than were met with higher up the lode. The ore, in places, has a peculiarly solid and compact appearance, and shows neither waste nor other foreign matter that need to be separated from the metallic bearing earths. The vein has a uniform thickness of six feet, though, in some places, it expands laterally to 10 or 12 feet, and the spread is even greater wherever chimneys occur, and they are frequently met with in the process of exploration. There are

Eight Winzes

Now being sunk from this level towards the sixth. They range from thirty to eighty feet in depth, and they are all in first class ore, as is the southeast extremity of the drift. The walls maintain the same smooth, clean-cut character that has distinguished them from the very first, and the same angle of inclination, about 80°, is most remarkably preserved throughout, thus sustaining the opinions that were early expressed of the strength and permanence of the Two G vein. Its mineral characteristics are the same now that they were when it was first opened. There is no change, except what is for the better, and the greater the depth that is attained, the richer and more abundant becomes the ore, which, as on top, partakes of the dual quality of milling and smelting. These two classes course side by side in the vein, but the latter only is mined at present, the former being allowed to keep in place until the company's twenty-stamp mill starts up, which will be in a few weeks hence, and there are thousands of tons of this class of ore awaiting the action of its stamps.

The Sixth Level,

One hundred feet beneath, presents in all respects the same, if not more encouraging features than those which we have been glancing at on the level which we have just examined. This level is opened along the lode toward both its extremities, something over seven hundred feet, all through the finest quality of ore, and the same distinctive outlines, solidity, richness and uniformity of trend and descent are observable throughout as far as explored. The shaft is now in process of being sunk to the

Seventh Level,

And there are several winzes commenced, that are to be driven toward it and that will have reached it long ere the site of the station will have been touched by the drill of the miner. The vertical distance from the sixth level, between which and the fifth there is only ten feet of a difference in the angle of the dip to the top of the lode, is in the neighborhood of 575 feet. One hundred and sixty perpendicular feet by seven hundred longitudinally of this space is as yet nearly solid vein matter, very little stoping or raising having been accomplished, all the ore needed for reduction purposes having been taken from the drifting along the ledge. It will, from this statement, be readily seen that there are thousands of tons of first-class ore yet in place, waiting the pick of the miner.

The Furnaces,

Of which there are two, have a reduction capacity of about fifty tons each 24 hours. This large quantity, which takes the united labor of but two men and one horse to transport it from the dumps at mine to the feeders at the furnaces, costs less than thirty cents per ton for hauling it over a tramway of about one-third of a mile in extent. This is quite an item of saving which adds largely to the marginal profits accruing from the enterprise. The foreman of the mine, Mr. Frank Newell, whose efficiency is best demonstrated by the character and magnitude of the explorations that have been effected under his eleven months' administration, states that he works on an average eighty men per month. These, with the smelters and other employees, constitute an available force of 150 miners that are on the company's pay rolls. But this number is a mere bagatelle compared with the small army of swarthy, stalwart

Charcoal Burners,

Whose camps dot the mountains round, and who are paid indirectly by the company's Superintendent, M. D. Howell, Esq., late of the Richmond, at Eureka. He has now entered upon his second year as manager of the company's property. This is the strongest encomium that can be bestowed upon his worth and ability. Nature, in addition to her mineral tributes, appears to have anticipated the smelters' and miners' wants by clothing the mountains' sides with a plentiful supply of just the quality of wood best suited for charcoal; of which the company's furnaces consume about two thousand bushels per day. There are several thousand bushels of it now stowed away in the bins to meet the emergencies of the approaching winter, for these seasons are sometimes very rigorous in this latitude, especially at this altitude. The above branch of industry is almost exclusively absorbed by the Italians, who burn it for the contractors, who in turn receive about 28 cents per bushel for it delivered at the coal bins adjacent to the smelting cupolas. The furnaces are now running very successfully, to judge by the large quantity of

High Grade Bullion

That is molded in each shift of eight hours. The daily out-put of bullion, the manager informs me, aggregates seven or more tons. This bullion gives a return of from $440 to $460 per ton in the noble metals, and the value of the lead runs from $85 to $100 per ton, thus enhancing the price of the bullion per ton just these amounts. Figures and facts are stubborn things to get round. The first are always held to be indisputable and the second are no less reliable, hence the confidence with which I present to your readers the above data in support of my previously penned opinions regarding the high character of mines and ore resources of the Tybo Consolidated company, and of the long and brilliant future now opening for this camp and that enterprising corporation. There are many other things no less interesting than the foregoing that I would like to dwell on, but since this letter has already far exceeded my limits, but I hope not your space, I must let them rest in statu quo until another occasion. GOTHAM.

Tybo, Nevada.

Alpine County—its Mines and Resources, Past, Present and Future.

[Written for the PRESS by VICTOR HARLAND.—No. 10.]

Silver Mountain District.

Adjoining the Mountain mine on the north is the location held by J. J. Rice, Esq., and known as the Silver Creek location. This being but little prospected, though having its own natural recommendations as an extension of the first named mine, cannot, owing to its undeveloped condition, claim a present position of prominence. Its future value depends mostly upon the ultimate developments of the Mountain, together with that of the Occident, the adjoining on the north. Situated as it is, between the two thus named, and having the same outline and surface appearances, what future disposition may effect either or both, will effect this also. Mr. R., an old resident and stockholder in the Mountain mine, has great hope for the future value of his mine and it is the wish of the writer that he may realize and enjoy a plentiful remuneration for his long and arduous waiting and toil.

The Occident,

Formerly known as the Mammoth lode—Rippon company—is also upon the same lode and has a large area of surface. It is well adapted for a better system of developments than heretofore indulged in by the old company, viz.: a tunnel of about 600 feet in length. At a distance of 125 feet from the tunnel mouth a lode ten feet in width was cut, this lode not appearing on the surface, and therefore receiving the appellation of a "blind lode." Howsoever blind it may appear on the surface the appellation thereby ends, for a better defined lode never existed than this appears, being incased within two perfectly formed walls of porphyritic tendency, with separations of porphyritic clay. The ore contained in this lode is of the black sulphuret variety and equally distributed throughout the rock. It is of rather

Low Grade,

Assays of ore taken from different places in the lode ranging from $8 to $25 per ton. It has a general course in a northerly and southerly direction, and as far as developed shows an unusually strong and clear outline, the separation of both walls from the outer formation being perfect and the quartz firmly and perfectly formed. The lode being encountered so near the surface cannot reasonably exhibit the permanency looked for when a greater depth shall have been reached. The perfect characteristics of this lode at this short distance below the surface is, to say the least, remarkable, when the extensive disturbances of the surrounding country are considered, and this fact alone, although the ore now found is of a comparatively low grade, forms a good basis on which a further development from a shaft may reasonably rest. This, however, is not the only foundation on which the future of the present company rests.

Before reaching the culminating point in the present tunnel

Another Lode

Was encountered and penetrated for a distance of 14 to 16 feet. This lode, of a similar character to the first named, or Lode One as it may be termed, will undoubtedly prove one of considerable extent, as the east wall has not as yet been reached. The ore contained in this lode is also of a low grade, but like that found in Lode One, is well distributed throughout. At the time this development was being prosecuted this was popularly supposed to be the main lode sought, viz.: the north extension on the Mountain. Even at this time opinions differ as to its true connection with that lode, the majority ascribing the positions to be at variance when location and dip of both are considered.

The Old Company,

After prosecuting the work to the end of the present tunnel, was forced, from lack of funds, to suspend operations, as the expense necessary at that time for the reduction of ores by the common mill process then in vogue would exceed the total mill value of the ore to be treated. Before reaching the lode last described, an unexpected stratum was encountered and through which for some distance the tunnel passed. This was no less than

An Old Water Course,

Containing a large amount of river sand pebbles and huge boulders worn round and smooth by continuous action of water during an age of the past. Just when, or in what mysterious manner this old water course made its appearance between two lodes of quartz with their solid outlying formations, situated on the north side of a mountain that shows an otherwise unbroken slope at this particular point, I leave for the scientist to determine, but of its existence as stated there is no question of doubt. After the forced suspension of work which took place in 1867, efforts were made at various times to resume work, but with no success, and this mine, like many others in the district, remained in a quiescent state for a number of years, until under the acts and requirements of the U. S. mining laws, it became subject to relocation. Accordingly, in January, 1875, a relocation of the property was made under the name it now bears—the Occident. Soon after the

New Organization,

Which took place in San Francisco immediately after the relocation, the tunnel, which had become dilapidated through years of disuse, was thoroughly cleaned and placed in a condition for the inspection of the lodes. The mine has since been bonded by English capital for $50,000 and has undergone a thorough examination by E. G. Gaertner, Esq., a mining engineer and expert of your city, who has also surveyed the locations for the company for the purpose of obtaining a patent thereon.

The Superintendent, Mr. Brown, is deserving of great credit for his untiring efforts to place the mine upon a permanent working basis, and the company, cognizant of the evidences already shown, together with additional inducements that will follow when the main lode shall be reached from a depth worthy of mention below the level of the basin, are endeavoring to second his efforts toward a resumption and continuous prosecution of labor in the right direction.

THE Petaluma *Argus* of Saturday publishes the annexed: Superintendent Bean informs us that the freight and passenger business on the San Francisco and North Pacific railroad at present is fully as large as it has been at this season of the year at any time since the road was built. Considerable repairing is going on on the main line in the way of leveling and ballasting the track, and new culverts are being put in in places. The grading on the Guerneville branch is completed, and workmen are engaged in constructing bridges, trestle-work and culverts on the section between Korbel's and Guerneville, which is about two and one-half miles in length. The track will be laid as soon as the iron arrives, which was shipped from New York about two months ago. The expense of constructing the branch road has been very heavy, parts of it having cost over $75,000 per mile. The terminus will be one of the most lovely timbered districts in the State, and millions of feet of lumber will be shipped over the road within the next few years, also many thousand cords of fuel.

ARTICLES of incorporation were filed on Tuesday for the organization of the Los Angeles and San Diego railroad company. The corporation is formed for the purpose of constructing and maintaining a line of railroad and telegraph in Los Angeles and San Diego counties, the railroad to commence at the city of Los Angeles, and run through Anaheim to the city of San Diego, a distance of 140 miles. The corporation will exist for 50 years, and has the following directors: Leland Stanford, David D. Colton, Mark Hopkins, Charles Crocker and B. B. Redding. The capital stock is $5,600,000, of which each director takes 200 shares out of the 56,000 in the company, besides the 200 taken by E. H. Miller, Jr., and Nicholas T. Smith.

THE METRIC SYSTEM.—Certain persons have strenuously urged that the adoption of the international weights and measures would be a source of great inconvenience and expense to the machinists and manufacturers. The advocates of the system, having made inquiries of machinists and manufacturers in various countries of Europe, reply that the objection is one of theory and not of fact, as those who have actually tried the experiment testify. As the old machinery wore out it was replaced with the new, and a little time being taken the greatly dreaded confusion and expense were largely obviated.

SCIENTIFIC PROGRESS.

New Optical Experiments.

Mr. F. E. Nipher sends the following to *Nature:*

1. Fold a sheet of writing paper into a tube whose diameter is about three centimeters (an inch or so). Keeping both eyes open, look through the tube with one eye, and look at the hand with the other, the hand being placed close by the tube. An extraordinary phenomenon will be observed. A hole the size of the tube will appear cut through the hand, through which objects are distinctly visible. That part of the tube between the eye and hand will appear transparent, as though the hand were seen through it. This experiment is not new, but I have never seen it described. The explanation of it is quite evident.

2. Drop a blot of ink upon the palm of the hand, at the point where the hole appears to be, and again observe as before. Unless the attention be strongly concentrated upon objects seen through the tube, the ink-spot will be visible within the tube (apparently), but that part of the hand upon which it rests will be invisible, unless special attention be directed to the hand. Ordinarily the spot will appear opaque. By directing the tube upon brilliantly illumineted objects, it will, however, appear transparent, and may be made to disappear by proper effort. By concentrating the attention upon the hand, it may also be seen within the tube (especially if strongly illuminated), that part immediately surrounding the ink-spot appearing first.

3. Substitute for the hand a sheet of unruled paper, and for the ink-spot a small hole cut through the paper. The small hole will appear within the tube, distinguishing itself by its higher illumination, the paper immediately surrounding it being invisible. Many other curious experiments will suggest themselves. For example: If an ink-spot somewhat larger than the tube be observed, the lower end of the tube will appear to be blackened on the inside.

4. Look through a paper tube with one eye at green paper, and through another tube with the other eye at red paper. The paper should be illuminated by the direct solar ray. The two colors, at first vivid, are rapidly enfeebled. After half a minute transfer both eyes to either one of the papers, say red. To the eye fatigued by green, the red color is very brilliant, and the effect is the more striking on account of the simultaneous impressions now received by the two eyes.

PETROLEUM AS A LIGHTNING CONDUCTOR.—The destruction of oil by lightning this year has been remarkable, amounting to 242 412 barrels from January 1st to July 31st of this year, or rather from April to August; there were no fires from this cause in January, February or March, two in April, none in May, four in June, and five in July. It is scarcely necessary to inform our readers that the oil destroyed is in closed-top iron tanks, and the lightning, striking these, explodes the gas that collects in the space above the oil, scatters the oil and sets it on fire, and in this way often communicates to other tanks in the immediate vicinity. The theory most commonly received in the oil regions of the cause of such frequent lightning "strikes" is that the gas, which, it is well known, is continually escaping from the oil in these tanks, rises to some distance above the tanks, acts as a conductor, attracts the lightning and the damage is done. One peculiar feature in the history of these accidents is, so far as we have been able to learn, no iron-top tank has been struck, but in every case wooden-top ones. We have made special inquiries on this point, with the uniform result given. So far, attempts to protect tanks with lightning rods have been failures; at Dilks station a number of rods, supposed to be ample protection, were placed about the tanks, but they were no protection against this summer's bolts. It may be interesting to those not acquainted with the oil business to state that in case of losses occurring in this way all the oil in the pipe line to which the tanks belong is assessed pro rata for the loss; that is, the law of "general average," so well known in marine law, is applied in this case.—*Stowell's Petroleum Reporter.*

THE VERNATION IN OAK LEAVES.—The proceedings of the Academy at St. Louis contain a paper by Dr. George Engelmann on the oaks of the United States. The discovery is announced that oaks have different ways of having their leaves folded in the bud—vernation. In some the upper side of both halves of the leaves are applied together in the growing bud. In other species the upper surface of the leaf is convex—that is, the edges are turned a little down or back. Another class has the leaves revolute, or spirally rolled back toward the midrib. The discovery is of vast importance to students of quercology, as it enables them to decide whether certain forms are hybrids or not, and in other ways to fix the limit of species. Another interesting discovery of Dr. Engelmann is that those oaks that have lobed leaves when young, have more entire leaves as they become aged. On the other hand, those are the most lobed with age, which have entire leaves when young. It is a singular inversion of character. Dr. Engelmann has, also, for the first time in botanical classification, made use of the characters of old bark in oaks in determining the boundaries of sections. By the new light afforded by these discoveries, Dr. E. is enabled to make many things plain to us that have been mysterious for a long time, and he promises to do more for us in the future. He enters on the subject of hybridity in oaks, and thinks that, though often forms are mere "sports," yet there are hybrids, and he gives a list that he regards as such.

A SUBSTITUTE FOR THE METRIC SYSTEM.—At the late meeting of the British Association for the Advancement of Science Prof. Hennessy read a paper on new standards of measure and weight. Owing to the objections many persons still entertain to the metric system, the author brought forward for consideration the standard which he had proposed several years since, and advocated by the late Sir John Herschel. The standard of measure is a bronze prismatanic scale, which is the fifty-millionth part of the earth's polar axis. From this a system of weights is derived by taking a function of the standard of length as the side of a cube and finding the weight of an equal volume of distilled water. In this way a series of weights were constructed in bronze; a chain containing 50 links, each equal to the bronze standard, was also constructed, and this chain was therefore the millionth part of the earth's polar axis. The link or standard scale measures very nearly 10.0097 English inches, and its tenth part, therefore, was very little in excess of one inch. This, as well as the geometrical superiority of the axial standard over one derived from any meridian seemed to have influenced Sir John Herschel and others in preferring it to the meter. The author afterwards explained the manner in which the standard of weight was derived from that of measure. The temperature at which the latter was taken was 15 deg. Cent., or a little more than 59 deg. Fah. Geodesical measurement had, in fact, shown that the earth is a somewhat irregular spheroid, and, therefore, that its meridians are unequal, while the polar axis is necessarily unique, and corresponds to every meridian. On these ground, Prof. Hennessy thought that the new standards might be universally accepted by all nations if the objections to the meter should continue to prevent its general adoption. It was stated that the standards of measure and weight referred to are now exhibited in the Loan collection of scientific instruments at South Kensington.

COMBUSTIBLE EARTH.—While recently engaged in botanical exploration on the higher parts of the island of Reunion, M. de l'Isle heard of some caverns, the soil of which was combustible. The *Journal of Chemistry* says he visited one of them and found it a grotto about ten meters in depth and six meters broad. Entering by a small aperture you descend to the bottom by a rapid slope. The bottom is formed, more than an inch thick, of a substance of ocher-yellow color, soft to the touch, insipid, inodorous, dividing readily into very light fragments which leave yellow powder on the fingers; these are easily reduced to powder by pressure or friction. When a lighted match is applied to one of the fragments the latter burns, if dry, with a very short yellow flame, almost without smoke or smell. If a little moist it is consumed without flame, with abundant smoke, and a smell of burnt herbs. MM. Bureau and Poisson have studied this interesting substance with the microscope, and found it entirely composed of small bodies which must be spores or grains of pollen. After various comparisons they were struck with their resemblance to the spores of *Polypodeæ* in form and reticulation and color; and they found among the *Polypodeæ* of Reunion, sent home by M. de l'Isle, one whose spores are almost identical with the small bodies in question. From the cohesion of the spores, and the slit found in most of them, by which the contents have escaped, it is inferred that this accumulation has been caused by water and not by wind. It is probably the first time that a rock has been found of such composition.

A NEW VIEW OF GLACIAL ACTION.—Dr. Joseph Worster, of New York city, in a paper read at the August meeting of the American society for the advancement of science, at Buffalo, N. Y., proposes a new and very simple theory to account for the ice-fields supposed by Professor Agassiz to have covered the whole area of Brazil during the glacial period. His view is that at a very remote date the whole surface of central South America was a high table-land elevated more than 10,000 feet above the sea level. As this would be within the ascertained region of perpetual frost, such an elevated plateau, receiving and condensing the evaporation of the two contiguous oceans, and converting it into ice, would, in the course of ages, become loaded to a tremendous depth. This vast deposit, by constant pressure, would finally cause a gradual sinking of the table upon which it rested, to restore the disturbed equilibrium of gravitation; and if it may be supposed that the wave of depression commenced on the east coast and terminated on the west, the Andes range would be upheaved at the final termination of the wave. This view is in harmony with the ascertained comparative recency of the Andes as a mountain range, and brings a problem that has resulted in many crude speculations—the problem of the ice period—within the scope of very simple and well ascertained laws of meteorology. For example, the ice traces of North America are susceptible of explanation on the same hypothesis.

MECHANICAL PROGRESS.

Welding Iron.

In a paper read before the recent meeting of the British Iron and Steel Institute, Richard Howson endeavors to disprove a common misapprehension that a bar or plate made out of several pieces welded together is not so good as one made out of a bloom formed from a single puddled ball. We shall not follow him through the discussion of this point, but select a few paragraphs to show what he regards as the philosophy of a weld and how a good weld is possessed of great strength. We quote as follows:

There is an impending change in the manufacture of finished iron, as it is admitted on all hands that machinery will shortly entirely supersede hand labor in the puddling process. Along with this conviction there is a current impression that iron will have to be puddled in large masses, and not divided into small balls as in the ordinary practices—that the system of piling must be abolished—that piling means welding and that welding is a mistake—that homogeneity is the thing to be aimed at. Now, when the matter is fairly considered, it becomes evident that iron rolled from a puddled ball is in no case homogeneous, and that the larger the ball the more heterogeneous it is likely to be. The term homogeneous can only be strictly applied to iron which has been melted—such as the mild steel which is made in Sheffield, containing a low percentage of carbon. When a specimen of material of this class is treated with acid, the surface being first polished, there is usually no appearance of grain, and the action of the acid is slow. On the other hand, a piece of ordinary rolled bar, subjected to the same treatment, shows a fiber which stands out like whipcord. Even the best cable iron exhibits the same structure. Its tensile strength is nevertheless little, if any, inferior to that of a really homogeneous bar. If we examine the structure of a puddled ball by cutting it in two and polishing the section, we find it to consist of an immense number of metallic nuclei interlaced with cinder or with cavities which once contained cinder. When such a ball is compressed under a hammer or squeezer, it is as essentially a process of welding as is that of a mass of screp iron. Such being the case, the more perfectly the cinder is expelled the nearer we get to homogeneity. The conditions, however, are in all cases unfavorable to the complete expulsion of the cinder from the center of a puddled ball, and it is evident that the larger it is the more are the difficulties increased.

There is a good deal of misconception about the real nature of the process of welding, and it is well to inquire what it is, and what means we have at our command for securing efficiency. When we bend a piece of iron, or stretch, twist or compress it, we experience resistance to motion. The molecules of the mass will not change their relative positions except by the exertion of a considerable amount of force. If the metal were rendered gaseous, the atoms become perfectly mobile; when it is liquid the state is neutral; and when it is viscous the attraction predominates. It is this attraction which affects the weld. When two globules of mercury, immersed in liquid, are caused to approach, a slight concussion causes them to unite, and the liquid between the two is perfectly expelled. This is an example of a good weld. A smith of ordinary skill is able to unite two bars of iron so firmly as to give way in any other part rather than the joint, but to do this he has to take the proper precautions. He has to see that the iron is sufficiently heated, that the surfaces are protected from oxidation by means of a flux, and that the flux is, as much as possible, expelled in the act of closing up the ends. The natural flux is, of course, the oxide of iron which forms on the surface, but this is of an infusible character, and he therefore assists its fusibility by the addition of sand. A basic silicate is thus formed, which flows over the surface to protect it from further oxidation, and to be expelled in its turn when the union takes place. The essential properties required by a flux are—a readiness to combine with the oxide of iron and fluidity at moderate temperatures when so combined. There are, of course, better fluxes than silica; but sand is cheap, and it answers every purpose, provided it is used with judgment, and not in too large a proportion. Its influence is felt from the puddled ball to the finished bar, in every stage becoming constantly more and more extenuated, and so permitting closer metallic contact. If we trace its course in some processes, we meet with extraordinary results. An armor-plate, made at the Atlas works, Sheffield, was 22 inches thick, and weighed 31 tons. It was made from puddled balls of the ordinary size, rolled into puddled bars. These were cut, piled and rerolled, and the process was repeated to the extent of doubling six times. The entire mass thus comes to consist of no less than 11,448 distinct laminæ, and each inch contains 528 such laminæ. The area over which the cinder contained in the first pile is spread by such a process becomes enormous, and the metallic adhesion is proportionally perfect. A piece of this plate, when polished and treated with acid, showed a near approach to homogeneity, and affords a good proof of the efficiency of welding.

The 100-Ton Gun.

We have formerly made note of this great engine of war. There now come specifications which will enable the reader to obtain a more definite idea of the style of metal working which is involved in its construction. *Iron* says: As already intimated, the 100-ton gun is on the coil principle. Without drawings it is difficult to give a clear description of this weapon. We may, however, state generally that it consists of an inner steel tube enveloped by successive layers of wrought iron coiled cylinders, the total number of coils being 10, 6 or which refer directly to the rear half of the gun, the remaining 4 being placed singly end to end around the barrel of the gun from the front of the shot chamber and trunnions. The steel tube for a length of 13 feet from the rear end of the gun is surrounded by a coil 7 inches in thickness. Outside this is a coil 8 inches thick for a length of 9 feet 9 inches; then comes the trunnion coil, 11 inches thick and extending 2 feet forwards, beyond which again is a tapered coil, having an average thickness of 6¼ inches, and extending forward 3 feet 3 inches more. Outside the second long coil is another to the rear 9 inches thick and 5 feet 6 inches long, which reaches to the trunnion coil. Assuming that the trunnion coil terminates the powder chamber, or, to be exact, that portion of the bore assigned to the powder charge and projectile, the breech portion may be said to be enveloped in 3 coils. The 4 single coils commence midway of the length of the gun and terminate at the muzzle. They taper from 10 inches thick at the point first indicated to 2¾ inches at the point last named. All the coils interlock and overlap each other to a greater or less extent at their junctions. The extreme length of the gun is 32 feet 10¼ inches; the greatest diameter at the breech is 6 feet 5 inches; the diameter at the trunnion coil is 5 feet 4½ inches; the diameter at the point where the single coils commence is 3 feet 9 inches; the muzzle diameter being 2 feet 5 inches. The steel tube is 31 feet 3 inches long, and has a thickness of 6 inches in the powder chamber, diminishing to 3½ inches at the muzzle. The bore is 30 feet 6 inches in length and 17 inches in diameter. The gun is rifled on a form of polygroove rifling recently introduced for heavy muzzle-loading guns by Sir William Armstrong & Co., and the system has already been tested in several such guns. In this system the projectiles are not studded, but each has a copper ring or gas check affixed to its base which approximately fits the grooves, and, being expanded by the explosion of the powder, absolutely fills the grooves. By this means the gauge of the gas beyond the base of shot is entirely arrested, and at the same time rotation is imparted to the projectile. The copper ring has the further effect of centering the projectile at the rear, while in front the windage is reduced to an inappreciable amount by a copper band about 2 inches broad. The twist of the rifling is an uniformly increasing spiral, terminating at the muzzle in one turn in 50 calibers.

The precise powder charge has not yet been determined, nor will it be until the gun has been put through a course of experimental firing at Spezzia. It is probable, however, that it will be nearly 400 pounds of powder made with 1.5 inch cubes. The weight of the proof projectile will be 2,500 pounds, and that of the service shell 2,000 pounds. The powder charge will be ignited through an axial or rear vent, and will be exploded upon the central ignition system. It consists in a means of igniting the powder at a point as nearly as possible midway of the length and depth of the cartridge, and, therefore, in its center. This system has formed an especial study with Sir William Armstrong's firm and has been developed into successful practice by Captain A. Noble, F. R. S. By its means, as far as has been ascertained, the powder is uniformly and therefore usefully burnt, the whole of its resulting gases being made available upon the shot before it leaves the gun, no energy being uselessly expended upon the air after the exit of the shot. In other words, it renders the perfect combustion of the powder within the gun a possibility.

The 100-ton gun will be mounted on a special carriage fitted with hydraulic gear for maneuvering and for taking up the recoil after firing. The loading and sponging of the weapon will also be performed by hydraulic agency, the whole system having been carefully designed by Mr. G. Rendel at Elswick.

In the absence of experiments it would be idle to speculate on the probable performances of the 100-ton gun. There are so many conditions which modify results that it would be waste of time to do more than state what the theoretical work of the weapon is. What is anticipated in practice is that the gun will give a duty of not less than 30,000 foot-tons—that is, that the dynamic effect will be equal to lifting 30,000 tons 1 foot high, or 1 ton 6 miles high.

NOVEL MODE OF STRENGTHENING CAST-IRON.—The president, Mr. R. M. Daucroft, and members of the civil and mechanical engineers' society, when visiting Kirkaldy's testing and experimental works the other day, were shown a cast-iron bar which had been sent to him to test as a sample that had been treated with mysterious chemical mixtures, which were said to increase its tensile strength over 50 per cent. But as Mr. Kirkaldy's rule is always to break the specimen, or else his machine, he found it to contain, upon being fractured, a center core of wrought iron about two inches in diameter, and six smaller ones of the same metal spaced around it. He thus exposed the secret.

MINING SUMMARY.

THE following is mostly condensed from journals published in the interior, in proximity to the mines mentioned

California.

ALPINE.

EXCHEQUER MINE.—Alpine *Chronicle*, Oct. 14: Good ore continues to be taken out and the mine never looked better. On Wednesday last, in the 400-ft level, 48 feet east of the engine shaft, the casing of the lode was struck.

EXCHEQUER SAW-MILL.—This mill is working night and day, getting out lumber for this Exchequer and I X L mines and the I X L mill. The Huntington shingle mill is about ready to commence work. A planing, molding, tongue and grooving machine is en route from the Vulcan iron works, San Francisco, for this mill. In a few days the saws and other appliances will be connected with the engine.

THE NUMBER.—Upwards of 200 men are employed at the Exchequer and I X L mines, mills and wood camps.

I X L.—Good ore is being taken from this upper tunnel. In the 200-ft level they are running on casing of lode to the ore shuts, from which the rich ore was taken in 1865, and it is expected that 124 feet more will reach it.

EXCHEQUER QUARTZ MILL.—The O'Harra furnace is ready for work, and is out waiting for this additional battery to be placed in position, which work is going on as fast as possible.

AMADOR.

MECHANICS' MINE.—Amador *Ledger*, Oct. 14: The owners of this mine have purchased a steam engine for hoisting purposes, and are now erecting it over the works. It is the intention to fit up the old Lincoln mill, situated on Sutter creek, within the town limits, for crushing the rock. This owners feel confident that they have a paying property. The rock is said to test well, but of course the actual worklng of ths ore will be necessary to settle whether the mine is likely to prove a profitable one or not.

CALAVERAS.

GWIN MINE.—Calaveras *Chronicle*, Oct. 14: The work of repairing the shaft in the Gwin mine is finished, and labor has been resumed in the levels. The 1100-ft atopea will furnish rock sufficient to keep the mills employed for six weeks or two months, by which time the 1200-ft level will be run and stopes opened. The mills started last Thursday, we believe, and there is nothing to prevent their being kept in constant motion for an indefinite period. The shaft is now in better condition than ever before, and it is probable that there will be no interruption of operations, no difference how severe the coming winter may prove.

VEITH'S HYDRAULIC.—If any one wishes to see lively mining operations, a visit to Veith's hydraulic, on Tunnel ridge, will well repay him. Work is not only prosecuted on a gigantic scale, but it is urged with a vim and steadiness that merits a rich reward. Piplog la prosecnted in both the upper and lower claims as steadily as circumstances will permit. In the lower claim the top has been stripped from a large area of ground, and the rich bottom deposit is now being washed. In the upper claim the great number of boulders uncovered by the hydraulic interferes with operations somewhat, but work is being pushed as vigorously as possible. Mr. Veith contemplates making a general clean-up of all his claims about the first of November, preparatory for the winter's campaign, and we expect it will be the largest ever made in the vicinity from a single washing.

THE DURYEA MINE AND MILL.—Active operations are in progress at the Duryea gravel mine, in Chile gulch. The mill lately put up for crushing the gravel performs admirably and is kept in motion day and night. The stamps, weighing upwards of 600 pounds apiece, are kept at a speed of 82 strokes a minute, developing a crushing capacity that permits the grinding and washing of a large quantity of gravel daily. The auriferous gravel is obtained from "breasts," opened at the extremity of drifts, several hundred feet in length, reaching into the hill, and is brought to the mill in cars drawn by mules. Nineteen men are employed in the mine and mill, everything proceeding with the regularity and precision of clock-work. Mr. Duryea is one of the most indefatigable miners in this section, and we are glad to know that his energy and perseverance is being well rewarded. Since putting the shove in type we learn that quite a quantity of water has been struck in the mine, which will necessitate a temporary suspension of operations.

THE LAMPHEAR MINE.—A visit to the Lamphear quartz mine, about a mile and a half from town, shows a very favorable state of affairs. Work is going steadily forward with the most encouraging results. The main shaft has reached a depth of 130 feet, and is being sunk rapidly. The ledge deflects so much from the plane of the incline of the shaft that no quartz is visible in the bottom, but drilling across to the hanging wall determines the presence of a wide lode of splendid ore. Rock is being stoped from the 100-ft south level, at a distance of 80 feet from the shaft. The ore mined is of a fair quality, the ledge showing from three to five feet in width. The pumping and hoisting machinery works splendidly, and all the appendages of the mine are first-class. The mill in connection with the mine—a 12-stamp battery—has been running steadily during the past two weeks, with the exception of an occasional interruption caused by scarcity of water. Rock is being crushed from both the Lamphear and Quaker City mines, the appearance of the plates indicating that the ore is of good quality and promising a healthy clean-up.

EL DORADO.

WOODSIDE.—El Dorado *Republican*, Oct. 12: We learn that the Woodside mine, at Georgetown, closed down on the 20th of last month, and it is doubtful about its ever being started up again. A large amount of money has been expended upon it during the past two years, and we are, with many others, disappointed in the result.

MINING matters about Garden valley are looking up, and everything looks hopeful for the future.

INYO.

KEARSARGE.—Inyo *Independent*, Oct. 14: The Kearsarge mill is pounding away to a good purpose on surface ores principally, but owing to the fact that the ores will soon become too wet for dry crushing, which is the process in use, it is likely that in a few weeks the mill will have to shut down for the winter. The tunnel heretofore referred to as being run to tap the Kearsarge mine proper at 180 feet below the bottom of the shaft, is now in about 50 feet, having some 250 feet yet to go. The ore in the bottom of this shaft is not only abundant but exceedingly rich. No ore can be taken out to advantage, if at all, until the air connections between tunnel and shaft are complete, which will require several weeks. There is no ore in the tunnel so far, nor is it likely there will be before reaching the ledge at the shaft. The Cliff mine, situated higher up on the mountain, is furnishing the principal supply for the mill, and is looking very well. The Bruckner roaster has been run constantly, giving satisfactory results, and without trouble, other than the clouds of dust it sends forth from its charge. It is quite likely that this dust also carries off quite a percentage of the precious metal, but if so there is still enough left from these ores to satisfy all reasonable expectations and desires.

FROM LIDA VALLEY.—L. Wick, who has stuck to Lida valley all this time, was in town this week after more goods. He says the future prospects of the camp appear to be about as heretofore for a year or so back—somewhat mixed, since the leading property became involved in litigation and contingent therenpon. The mill is kept running most of the time, the miners having it on lease to run themselves on their own ores. Nothing to being done at the once most promising camp of Gold Mountain, some 20 miles south. There is some probability, however, that a mill ere long will be built to work the ores from the somewhat famous State Line ledge, situate some five miles from the camp.

LOG SPRINGS.—Unless a "dicker" can be made by which to obtain ores from some other than its own mines to supply the Broder & Moffat furnaces, at Log Springs, the prospects are that all work in connection with that property will soon be suspended for the season. Ever since the furnace shut down a small force has been kept at work on the Uncle Sam, driving a tunnel to open the mine at a lower depth, where it was hoped a permanent body of ore might be found, and in sufficient quantities to justify running the furnaces. As yet no such strike has been made, though we are assured the indications are really encouraging, but still hardly sufficient of themselves to render a winter campaign advisable, all the surroundings and circumstances considered. There is, however, an abundance of ore in the adjacent district of Sylvania already on the dumps, and the owners are desirous of furnishing the furnace and keep it running. But as none of this is in the immediate vicinity, the cost of transportation and reduction, together with the purchase price, leaves no margin for profits, except upon first class ores. Whether a sufficient quantity of this kind can be obtained to justify starting the furnace is a question that will be determined in a week or two. Kincaid has about 200 tons of good smelting ore on his dump, but how much of it is of the kind that will pay to transport and reduce at the Log Springs furnace remains to be seen.

ANOTHER MINING COMPANY.—*Coso Mining News*, Oct. 14: Hon. H. W. Fortune, who came up from San Francisco several days ago to look at our properties, has purchased the Santa Rita mine conditionally, and if it should develop big enough, he thinks he will put up smelting works. He has no connection with the parties who purchased the Tyler property.

MACHINERY ARRIVING.—A No. 8 Sturtevant blower and some other machinery for Mr. Portois arrived a few days ago. The balance is now due, and we understand he expects to have his furnace—the Tyler—running within 60 days.

BULLION.—It is reported that the Modoc company have turned out 360 bars of bullion in the last four days ending Friday night.

MONOO MINES.—George Hearst, Mr. Tozier, Mr. Louis Williams and a number of other experts have been visiting the Modoc mines during the past week and witnessing the starting of that company's furnaces, and all express themselves highly gratified with all they have seen. The mines continue to improve with the rapid development and exploitation they are receiving, and the furnaces are starting much better than was anticipated. Mr. Barber, superintendent, informs us that they are running out five bars per honr, getting a ton of bullion from three tons of ore. This, for a new furnace and new ores, is good enough, but when run for a longer time, and on becoming more familiarized with the ores, the result will be much better. The success of the Modoc is the commencement of a new era for our whole mining section.

CERRO GOANO MINES.—Our mining interests are in *statu quo*—that is, the Union mine is the only one worked to any extent, and is turning out some very good ore, better than has been the case for some time past. The new hoisting works are in active operation, and the large building is presenting quite an imposing appearance. It will take, however, some time yet before the new shaft will reach the ore body, and then we hope for palmier days. The two furnaces are running and yielding a goodly number of bars daily. The only other mines worked is one of Ohris. Crohn, Esq., in San Lucas canyon, where that gentleman has five men employed, and where he has quite a flattering prospect. Dr. Hehner has given ont a contract to three men on his Belmont mines and will probably work more men shortly, as he has all confidence in his property. An offer has been made to him for one of his mines, but I do not know whether he will accept of it or not. Belmont is a very promising and rich silver camp, which has produced thousands of dollars, yet it is a wonder that it has remained so long without a mill, perhaps on account of the high freight charges and for want of proper representation in the local paper.

MARIPOSA.

ENCOURAGING.—Mariposa *Gazette*, Oct. 14: We learn from Bear Valley that a cross-cut has been started at the 2000-ft station to tap the vein, about 50 feet distant, and which will probably reach it to-day. This will prospect the lode at a depth of 900 feet from the surface. Developments of considerable importance may now be looked for.

MONTEREY.

QUICKSILVER.—Salinas *Index*, Oct. 12: The Salinas quicksilver mining company have a force of ten men employed at present, and are busily engaged in the erection of buildings at their mine. The tunnel is now in a distance of 55 feet on the ledge. A 50-foot shaft will immediately be sunk in the tunnel at a point 50 feet from the mouth. When completed a drift will be run on the ledge from the bottom of the shaft towards the surface, for the purpose of more thoroughly prospecting it. Private parties, who have just returned from a visit to the mine, report it as looking splendidly.

NEVADA.

RISING SUN MINE.—Grass Valley *Union*, Oct. 10: We are informed that a rich strike has been made in the Rising Sun mine, situated near Colfax, and that at the present time the mine is looking better than at any previous period of its history. And what is more important, the shute of rich ore promises to give profitable working for a long time to come. The Rising Sun has been worked for years, with varying fortunes, but during the past season has been doing very well, and the recent development gives assurance of a long prosperity. All the appointments of the mine, the mill and hoisting works, are first-class, and its management is excellent under the supervision of Superintendent J. H. Neff.

KENTUCKY RIDGE MINE.—Joseph Snydor, superintendent of the Kentucky Ridge mine, showed us some samples of decomposed ore yesterday, taken from near the croppings of the ledge, that were filled with fine gold. They were remarkably rich specimens, and presented abundant indications that the company's ledge is a true gold-bearer.

ANOTHER GOOD CLEAN-UP.—Grass Valley *Union*, Oct. 14: The Centennial mine has had another crushing and a big clean-up. The ore was put through John Smith's Orleans mill, which is one of the best gold savers on the coast. Fifty loads of ore, which was not selected with care, was crushed, and the yield was in the neighborhood of $5,000. The Centennial mine is looking better in stopes and drifts, and the ore now coming out will yield better than any from that mine heretofore worked. The Centennial has never levied an assessment, and looks now as if it never would need to do so.

MINING TALK.—There was more talk about mines yesterday afternoon than we have heard for many a long day. This talk was because of the fine appearance of most of the mines. The Idaho is going along in its usual dividend paying way; the Omaha is showing well; the Homeward Bound has splendid ore in sight; the Allison Ranch Franklin is far richer than any of the most sanguine stockholders had any right to expect. The fine prospects of the district make a talk, and the talk is justifiable in every respect.

BROKE THROUGH.—Nevada *Transcript*, Oct. 15: On Friday night, about eight o'clock, the whistle of the Gold Tunnel hoisting works sounded the call for the presence of the underground boss, Dave Hutchison. The occasion was that the workmen had tapped the old tunnel of the mine, which was 100 feet above them, by running a chute up from the lower level. Everything being in readiness for breaking through, a heavy charge of giant powder was exploded in the rock, which had the desired effect, and the water from the old tunnel came rushing down the chute in large volume, filling the lower level to a depth of 12 feet. The miners were all stationed at the foot of the ladder, and ascended the shaft, thus escaping a wetting.

WASHINGTON.—The two powder drifts in the Empire mine in Little York township were charged with 175 kegs of powder and exploded, doing good execution. The ditches and flumes belonging to this claim have been cleaned out and repaired, and the water turned on. Washing commenced as usual on Thursday. A large force of men are at work cleaning up the canyon belonging to the Council claim, which is turning out better than was expected. The other mines here are busy making preparations for winter.

A GENTLEMAN who was out hunting several days last week, informs us that the people here have no idea of the amount of prospecting for quartz and gravel mines that is going on. He thinks that there is more of that kind of work being done in this township than there has been for many years. If that is the case we soon shall hear of some valuable strikes. We do not know of a more inviting field for prospectors than there is in this county.

OWING to the scarcity of water, Mr. Berry, superintendent of the Nevada quartz mining company, informs us that he was able to run only five stamps of the mill, but the last rain has given him sufficient water to run ten stamps. The mine is looking first-rate.

PLACER.

MINING ITEMS.—Dutch Flat *Forum*, Oct. 14: Ditch cleaning and flume repairing is still progressing. Work on the South Yuba ditch is nearly completed, and it was the intention to resume running water to Chalk Bluffs yesterday. The branch leading to this place and Gold Run will be finished in a few days, but we are informed by the superintendent that it is not the intention to run any water in this direction until the rains commence, as the surplus in the reservoirs will not warrant it. The Cedar Creek company's ditches and reservoirs are being cleaned and repaired. The necessary work on them, however, is not extensive this season and the superintendent states they are now ready for water. The ditch of the Miners' ditch company is being cleaned and repaired, and will undoubtedly be in readiness before there is water to run in it. This company is building a storage reservoir on the South Yuba, near the Summit, which will extend its supply of water next summer. The various claims in this and Gold Run district, in which it is the intention to wash the approaching season, are being fitted up as fast as possible. In the Baker claim the incline passing under the gravel from the shaft to the rim rock is completed, and the claim will soon be ready for water. The Yankee tunnel is completed to a point opposite the Baker shaft, a distance of 2,100 feet from the mouth. The tunnelers have dropped back and are now driving a branch to connect with the shaft, which will be finished early next week.

NORTH FORK OF THE AMERICAN RIVER MINES.—At Euchre bar they are still busy washing in the Ross and Ford claim with good results. They are also sinking a shaft, which is now down 30 feet, and will have a pump at work in it in a few days, run by an overshot wheel. This is thought to be the old channel of the river, that has paid so big below, and never could be prospected here owing to the depth of the gravel and a large amount of water to contend with.

GREEN VALLEY.—The G. V. B. G. M. Co. tapped the bedrock in the shaft near the river this week at the depth of 68 feet, and have abandoned it, the prospects not being sufficient to guarantee pay. The shaft in the hill is down 58 feet in splendid looking gravel, with every indication of striking good pay.

SHADY RUN MINES.—North American mine, formerly known as Osp. Anderson claim, has been recently purchased by Mr. Devely, of San Francisco. The gravel in this claim is known to be rich. There are 12 men working at present, prospecting the width of the channel and the course it takes. As soon as the water can be had the working of this mine will be commenced on a large scale.

WILD YANKEE.—This mine continues to be worked steadily, and has paid over $20 per day to the man during the season. Several other mines will be worked during the winter.

LITTLE YORK MINES.—EMPIRE.—The two powder drifts in this mine were charged with 175 kegs of powder and exploded, doing good execution. The ditches and flumes belonging to this claim have been cleaned out and repaired and the water turned on. Washing commenced as usual yesterday. A large force of men are at work cleaning up the canyon belonging to the Council claim, which is turning out better than was expected. The other mines here are busy making preparations for winter.

PLUMAS.

ITEMS.—Plumas *National*, Oct. 14: The North Fork company have suspended operations for the present at Cumming's hill, on account of the scarcity of water. That claim has paid very richly this summer. Active operations will now commence on the Franklin company's shaft on Willow creek, and we shall report a big strike there before the snow flies. The Chinese owners of the English Bar claims are putting a large number of men to work. The Great Sensation mining company have let a contract for a tunnel 120 feet in length, to prosecute their gravel claim, which is located on the ridge east of Thompson's creek. The stock is all held in Quincy, and the owners, as the name indicates, have hopes of a big strike when they get to it.

FRANKLIN BLUE GRAVEL.—This company, whose claims are situated on Willow creek, near Nelson point, and who, last fall, sunk a large shaft to a considerable depth in search of the blue gravel lead developed in the Pierson claim, have recently made arrangements to resume active operations. Mr. E. T. Lacy, of the S. F. firm of Parke & Lacy, has been looking over the ground, and has made an agreement to furnish the necessary machinery for a certain amount of stock. Mr. Lacy started below last week, and the chances are that the engine and boiler are on the road by this time. The work will be pushed rapidly, and in two or three weeks we expect to hear that the shaft is down to gravel. We are glad to hear that the company is now in a shape to go ahead, for it is almost certain that the shaft will develop one of the richest mines in the State, and at the same time demonstrate that the lead is of vast extent.

SAN BENITO.

ANTIMONY.—Hollister *Enterprise*, Oct. 14: Few know that within the borders of San Benito county there lies perhaps the most extensive body of this ore in the world. We had heard of the big strike of this metal in the Stayton mines, and in order to ascertain the correctness of the report, went up Wednesday to investigate. There is no doubt that a mountain of antimony ore has been disclosed. The main lead has been stripped 75 or 100 feet, and shows a solid wall of first-class metal. The superintendent says he can extract from the body of ore in sight, with five hands, 80 tons per day. The company are supplying a San Francisco firm with 72 per cent. ore at $50 per ton on the ground, and can take it out as fast as it can be transported to the railroad. Several hundred tons of a lower grade lie on the dump to be carried to the furnaces when they commence operation, where it will be reduced into crude bullion for shipment. It is believed by experts that the ore produced will average 40 per cent. The company have erected two good furnaces at the bottom of the Stayton grade, one of which is completed and will start up on Monday, and the other will be ready for work in ten days.

TUOLUMNE.

RICH VEIN.—*Union Democrat*, Oct. 14: The Shawmut mining company, near Jacksonville, owned by Maurice Dore & Co., of San Francisco, have struck a rich vein of rock valued at $200 per ton. This mine has lain idle ever since the failure of the Bank of California. The Ollo mine, at Jacksonville, is being rapidly re-opened and two men are clearing away debris, etc., preparatory to driving a tunnel.

Nevada.

ELY DISTRICT.

MEADOW VALLEY.—Piochs *Record*, Oct. 11: There was some talk on the street yesterday about the Meadow Valley mine starting up again. Telegrams passed back and forth, but up to this time of going to press we heard nothing definite either way. If the foundations were put through during the present fine weather, they could be finished and the pumping machinery in place by the time the snow flies. The mine is there with as good a prospect to-day as any non-dividend paying mine on the coast. If it were in another locality the stock would be worth $50 a share. We hope the management will decide to start up again. The prospect justifies all necessary outlay. The value of the mine is one thing, the management of the mine quite another.

EUREKA DISTRICT.

TOO MUCH ONE.—Eureka *Sentinel*, Oct. 8: It is something hitherto unheard of for a mine to be troubled with too much ore, but such is really the case with the Richmond company in this district. They are capable of producing 300 tons of ore per day, if the furnaces could reduce that quantity; but, as that amount is beyond the smelting capacity of the furnaces, the ore has accumulated till it has come to be a sort of a welcome nuisance. The mine and dumps are full to overflowing, and the company have been obliged to discharge a number of miners on this account, and the mine will be shut down during the day in order to give the teams a chance to reduce the dumps. Mr. Potts, the foreman, to whom we are indebted for the above facts, informs us that unless means are taken to keep the dumps clear and stop the accumulation of the ore below, he will be obliged to discharge still more men. It is not often that an increased production of ore from a mine results in the discharge of miners; and for their sakes it could almost be wished that the company did not have quite so much ore. This trouble is only temporary, however, and will soon be remedied, when the usual working force will again be employed.

CHARCOAL AND CHARCOAL.—The average amount of ore daily delivered at the Richmond furnaces from the Richmond mine is 145 tons. About 7,000 bushels of charcoal are delivered each day, of which 4,000 bushels are consumed daily by the furnaces. A surplus of coal is being accumulated at the furnaces at the rate of 3,000 bushels per day, in order to provide against contingencies and prevent the necessity of shutting down the works when the roads become bad and hauling difficult. The Richmond mine and works are at present the mainstay of Eureka; but there are prospects that before next spring other mining companies in the district will be in a similarly flourishing condition.

REESE RIVER DISTRICT.

MANHATTAN MINES IMPROVING.—*Reese River Reveille*, Oct. 14: As developments progress in the mines of the Manhattan company, every day's work shows an improvement in the extent and richness of the ore bodies. At the 375-ft level of the Frost shaft, that remarkably rich vein, the Independence, shows a still further increase in the richness of its ore during the past few days, and the stope is now yielding a large quantity of ore of an extraordinary high grade. The chimney has been tapped by the 290-ft cross-cut, through which the ores can be taken out much faster, more conveniently and cheaper than heretofore. The 500-ft level still continues to produce largely, with no diminution in the size of the vein, which is very strong at this, the lowest point, as yet explored. There is no known limit to the extent of this bonanza downward; but as it extends in an almost unbroken line from the 290-ft level of the Frost shaft to the 500-ft level, and as it has continued to the lowest point yet worked, there is no valid reason why it should not again be encountered in any or all cross-cuts or side workings which may be run from any depth which the shaft may ever attain. In fact, the agent and superintendent are confident that this rich ore body will be found by all cross-cuts that may be run in the deeper workings of the shaft, and do not consider the possibility of such not being the case. The ores above and below the 600-ft level of the Bowman incline likewise show an extraordinary improvement in grade, and promise to yield a higher average in bullion during the present month than ever before, and they have always been "up in the figures."

WARD DISTRICT.

NEW MINING ENTERPRISE.—White Pine *News*, Oct. 14: The Steptoe Consolidated mining company, recently incorporated in San Francisco to operate in Ward district, have commenced active operations. The management of the company's affairs at the mines is under the immediate superintendency of Mr. Robert Briggs, for some time past connected with the Martin White company, and is a guarantee that the working of the mines will be conducted with economy and intelligence. There is included in the corporation some of the best mines in the district. Among the number is the Emily, Profit, Ready Cash and Light, all of which give promise of yielding large amounts of high grade ores.

WASHOE DISTRICT.

OPHIR.—Gold Hill *News*, Oct. 12th: Daily yield, 300 tons of ore, keeping the mills running as a mail. The ore breasts have shown a decided improvement during the past few days, the car samples to-day averaging $130 per ton. Timbering the main incline is nearly completed down to the 1700 ft level. It is expected that everything will be in readiness to commence sinking for the 1800-ft station by the first of next month. The ore-producing sections of the mine are all looking well, especially the east ore body on the 1600-ft level, which is widening out and growing richer as the stopes go southward. The north and south drifts from the winze 50 feet below the 1600-ft level are in very promising quartz. Both of those drifts have some distance to run westerly to cut the ore bodies on the 1600-ft level. The south drift is further advanced than the north drift and is evidently in close proximity to ore. The west cross-cut from the north drift on the 1600-ft level is in favorable vein matter, and is evidently approaching the ore body cut by the drifts farther south. On the 1700-ft level cleaning out and repairing the east drifts and cross-cuts preparatory to a renewal of the prospecting operations in that portion of the mine is making good progress. The north drift on that level is being pushed ahead, the face in very favorable vein matter, showing considerable improvement within the past few days. Cutting out the pump station for the lift pumps and water tanks, preparatory to putting in the new large pumps now at the mine, is making good progress.

CON. VIRGINIA.—Daily yield, 550 tons of ore. The ore breasts on the 1400, 1500 and 1550-ft levels are showing finely. Those being opened on the 1550-ft level are especially rich, opening, as the work advances, with as rich if not better prospects than any ever developed on the upper levels. The Consolidated pan and battery mill were both started into full working operation last Monday morning, everything working with the utmost perfection. The starting up of this mill makes an addition of 300 tons of ore per day to the crushing capacities of the mine, and will enable the management to easily increase the yield of bullion to the old figures of $2,000,000 per month if they so de-

sire. The drift south, on the 1600-ft level, running through the ore vein to connect with the north winze below the 1550-ft level of the California, is progressing four feet per day, the face still in ore of the richest and finest character. This body of ore so far as penetrated is of a hard, solid formation, that hetokens not only a continuation of the magnificent width of the vein on the level above, hnt also a huge, rich mass with no ordinary poor ores mixed in with the good. The diamond drills on the 1700-ft level are heing daily advanced to tap the body of watsr in the hottom of the south winzs helow the 1550-ft level. The 1700-ft station in the C. & C. shaft has heen opened and a drift started to tap the ore vein on that level. This drift is advancing at the rats of ahout nine feet per day.

Savage.—Ths heavy flow of water struck last week is being again gradually overcome hy the united efforts of the small pumps used in conjunction with those of the Hale & Norcross. A new Cameron pump was placed in position day hefore yesterday, which is doing splendid execution. A new air compressor has heen received at the mine, which will be placsd in running order in a very short time, and which will afford ampls power to run all the small pumps and feed the large 14-inch pump as fast as the pumping engine at the surface can hoist the water. The Hale & Norcross are preparing to put another force pump in their main incline, when it is helisved that the combined pumping machinery will handle the watsr with perfect ease. It should he understood that even while the water rises in the shaft the pumping goes steadily ahead without the least cessation or interruption. Every gallon of water raised lessens the amount of water contained in the large reservoirs tapped underground, and the causs of tho sudden rises is supposed to oome from the giving way of reservoirs of water on tho lower levels, the head or pressure heing so great as to rush a hody of water into ths shaft much greatsr than the capacitiss of the pumps.

Justice.—Daily yield, 155 to 160 tons of ore. The ore hreasts continue a good yield of ore of increasing valne. The yield of the mine for the past thres months under the present superintendency and management has heen steadily on the increass. For the month of July it amounted to only $56 000; in August, $75,000; and in September, $145,000; and will, if nothing unusual happens to prevent, reach $175,000 for the month of October. Arrangements are also heing made for the addition of still another mill in a short time, which will add still more to the hullion production of the mins. The prospecting drifts on the 800-ft level of the mine are heing driven ahead without any material changes during the week. All three of the cross-cuts are showing well. But littls has been done on the 1000-ft level during the week, owing to the shaft having heen used most of the week for repairing the pump rods, which were getting too old and worn for further use.

California.—Daily yield, 550 tons of ore, kesping ths mills running steadily as usual. The ore stopes on the 1500-ft level are yielding rich ore, and have never shown hetter in the past than thay do today. The mine in fact is now in hetter shape throughout and the ore developments in every portion of it showing more extensive and lasting than ever in the past. The character of the ores are such that if the managemsnt so desired they could without much effort raise the yield to $2,000,000 or $2,500,000 per month, without the addition of another stamp or the extraction of a ton more of ore than it now yields. The usual monthly dividend of $2 per share, aggregating $1,080,000, was declared on the 7th inst. Sinking the C. & C. shaft is making steady progress, the flow of water at the hottom heing still as strong as ever. The pumps continue to drain this flow of water, although kept running up to their fullest capacities.

Aurkola and Argentina.—The fine working shaft which is heing sunk to develop these two mines at the joint expense of the respective companies is getting along very well under the efficient managemeot of Supsrintendent Bennett. He found considerable hard work to do in trimming down the sides of the shaft and in enlarging it for timhering, hut he has made a most excellent joh of it.

Mexican.—The winze heing snnk helow the 1465-ft level is showing an improvement, the ore giving fair assays. Ths formation overhead in the upraise has every appearance of an approach to a good hody of ore above, and a cross-cut east has heen started on the 1300-ft level to cnt ths vein shove that point. The mine has not been prospected anywhere helow the 700-ft level, and a series of drifts will he started as soon as practicable to cross-cut the ledge on the several levels ahove the 1300-ft level, in order to ascertain the valne of that portion of the mine.

Chollar-Potosi.—Daily yield, 100 tons of ore, the assay valne of which is $32 per ton. The old ore stopes show no material change, and the ore extracted no difference in quality.

Pontiac.—Tnis mine is the wsll-known old Carl location, made in 1859. It is one of the oldest and best locations made in Devil's Gate mining district, and joins the St. Louis on the south. The principal tunnel, 400 feet in length, passed through a splendid ledge 150 feet wide, showing excellent streaks of ore. The mine has recently passed into the hands of a company of men of practical mining ahility and capital, and incorporated under the name of the Pontiac gold and silvsr mining company.

Twin Peaks.—The new working shaft is well commenced, and being sunk at a lively rate. This shaft consists of three compartments, two for cages, each four and ons-half hy five feet in the clear, and the other for the pump, is five hy six feet in the clear.

Yellow Jacket.—The drifts hoth east and west at the 2040-ft level are pushing ahead in favorable looking vein material. At the 1940-ft level the air pipes are in and drifting north is commenced, to meet and connect with drift coming south from the 2135-ft level of the Imperial.

Bullion.—The east cross-cnt from the north drift on the 1400-ft level is showing some very favorable prospects of soon reaching the main ledge. The north drift on the 1700-ft level is being steadily advanced, the face in very favorahle ground.

Solid Silver.—This is one of the earliest of the old mining locations in Cedar ravine, a short distance ahove the Sierra Nevada mine. It was formerly known as the Washoe, and having heen relocatsd and hrought into proper working shape, it will now he practically developed.

Crown Point.—Daily yield, 60 tons of ore, from the old upper levels of the mine. Cross-cuts are soon to he started at several points on the 1700-ft level to frnther settle the valne of the ledge, although enough is already known to satisfy the most incredulous that the mine must hs prospected deaper in order to find a renewal of the rich ore hodies found ahove.

Amazon & Glasgow.—The pump columns are being put into the shaft, and everything will soon he in full rnnning order again.

Baltimore and Amerioan Flat.—The face of the east cross-cut from the north drift on the 1050-ft level is showing some good ore prospects.

Cosmopolitan.—The Hope mill commenced running on ore from this mine yesterday morning. There is plenty of it in sight in the mine to keep the mill steadily rnnning for some time to come. The stopes from the upraise are showing and yielding well and the north drift from the winze below the adit level is in ore of a superior character, showing bunches of very rich ore occasionally.

North Carson.—Excellent progress has been mads during the past week or two sinking the main shaft. It has been passing through excellent streaks of ore, and the station at the 400-ft level will he opened shortly.

Florida.—The northwest drift at the 400-ft level is still advancing well, with its face at present in very hard rock of irregular stratification, which does not blast well.

Niagara.—The week has heen occupied in rssetting the hoisting machinery so as to place it on a hetter foundation and make it more serviceable in sinking another working compartment to the main incline.

Silver Hill.—Sinking the main incline is making fair progress. The east drift on the 650-ft level is also heing pushed rapidly forward, the face in good working grnnd.

Leviathan.—The facs of the north drift at the 600-ft level is showing even hetter than at last report, more streaks of ore, giving hetter assays, making their appearance.

Overman.—The north and south prospecting drifts on the 1200-ft level are each steadily advancing, the face of hoth still in very eocouraging vein matter.

Caledonia.—Sinking the main shaft is making somewhat hetter progress, although the flow of water at the hottom is still strong, and keeps ths pumps husy.

Belcher.—The new pumping machinery is working well. Daily yield, 300 tons of ore, keeping the mills steadily crushing ore from ths mine.

Lady Washington.—The station at the 850-ft level is cut out and drifting commenced eastward, cross-cutting the ledge at that point.

Sierra Nevada.—Ths prospecting drifts on the 1700-ft level are heing pushed rapidly ahead, and are looking much mors favorahle for some good ore developments than for some time past.

Trojan.—A station at the 300-ft level has heen cut out, and drifting sonth and east toward the good ore hody passed through hy the shaft and dipping in that direction, is now heing done.

Globe Con.—Work in the main drifts at the 300-ft level progressing well, and the incline is heing cleaned out and put in good working order.

Sutro Tunnel.—Total length of tnnnel, last evening, from mouth to face of header, 14,674 feet. Tne material now sncountered is easy working porphyry, with clay seams, allowing of a very good rate of progress.

Tahoe.—Sinking the joint shaft is making good headway, the bottom heing in soft ledge mattsr, carrying streaks of favorahls looking quartz.

Succor.—The erection of the new machinery is heing pushed to completion as rapidly as consistent.

North Con. Virginia.—Sinking the main shaft is being pushed downward at the rate of five feet per day, the hottom still heing in very favorahls ground. The new pumping machinery is doing good work, and is running as perfectly as it is possihle for it to do.

Herald.- The greater part of the past week has been spent in putting in improved hoisting gear for sinking the working shaft to a much greater depth.

Calcutta.—The diamond drill has heen discontinued, having penetrated to a depth of over 300 feet. Good prospects, sufficient to justify the sinking of a shaft, have heen obtained.

Kossuth —The opsning of the 600-ft station will he commenced, and a drift started for the ledge, in a very short time.

Imperial Con.—Owing to a breakage of the old pump rods in the main shaft, the progress on the lower levels has heen somewhat retarded during the week.

Rock Island.—Still pumping water from the 850-ft lsvel to the full capacity of the pumps.

Utah.—The large tank-pit and pump-station at the 750-ft level is about completed and ready to resume the sinking of the main shaft.

Continued on Page 276.

Hell Gate and the New Hallett's Point Channel.

Divsre are busy at work, eaye *Iron Age*, exploring the hottom of the new Hallet's point channel, and sonndings ars in progress dnring every moment of time during which it ie poesible to work. On account of the strong current running very little can be accomplished, except at the short intervals of slack water when tbe tide ie turning.

In soundings taken on tbe northeast eide of the ebaft, embracing a portion of the ehaft proper, and tbe reef within the radiue of 200 feet, it was found that a considerable amount of broken etone had been thrown into the ehaft by the explosion, but deeper water wae found on the other portione of the reef explored. Where there wae formerly a deptb of six feet of water only, from 12 to 18 feet were found.

Two eurveying parties are to be eet at work, and, shonld the weather prove favorable, it is thought that tbe snrvey can be completed in abont eix weeks. From 5,000 to 6,000 soundings about ten feet apart will bave to be taken.

The following official etatement hae bsen made by Gen. Newton in regard to the examination of the reef at Hallett'e point:

"Tbe reef at Hallet'e point hae been swept away, and the snmmary of facts is as follows: From 180 feet distant from the shore line to the line of buoys the bottom elopes gradnally from eight feet of depth at mean low water to 20 feet. Outside the line of bnoye nothing less than 20 feet of depth at mean low water was observed. The divere have been examining tbe reef, and report a thorough bresk-up."

The French World's Fair.—The programme for the next French international exhibition, 1878, hae been pnblished in the *Journal Officiel*. The reguletions are eubstantially the same as in former exhibitione. The building is to be a long parallelogram, and will be divided into rectangular etripes, two of tbese etripee being allotted to spscial divieions, one for France and the other for foreign conntries. Fine arts will enjoy the central etripe, and conseqnently be an exception. Right and left will be placed the two etripes allotted to ecientific indnstries, under the name, "education, teaching, methods and *materiel* of liberal arte." Amonget the principal attractions of the exhibition will rank a gigantic Giffard eteam captive balloon. It will meaeure 21,000 cnbic metere, and exceed by 10,000 the former captive balloon at Aebburnham park. The rope will weigh 20 ponnds per yard, and the elevation will be 500 yarde. The eteam engine will have 200-horse power; 30 pereons will aecend at once, and in calm weather 100. The new captive balloon will require no circus for protection, and will etand in tbe midst of a large equare fronting the bridge in the central alley of tbe gardene. Meteorological observations, with epecial inetrnmente, will be made dnring the ascente for the instruction of excursionists, and recorded for the benefit of scienoe.

In 10 years the screw hae entirely replaced the paddle in tranеatlantic navigation, the weight of marine enginee has diminished one-half, the eteam preesnre has quadrnpled, and the consumption of coal hae decreased two-thirds.

Gold Mining in French Guiana.

Consnl Wooldridge, reporting to ths Forsign Offics on ths trsde of Frsnch Gniana, noticse the gsneral abandonment of agricultural labor in ths colony in favor of the gold industry. The valne of the gold finds in tbe year 1875 ross to £64,300 more than in 1874. Of ths £252,925, the value of the total exports of 1875, the export of native gold enpplied no lsss than £227,568, statsd ae tbe value of tbe 113,118 ounsss exported. Tbe Consnl says: "Thers ie mnch capital now in the colony poesssed by natives who hsve mads enormous fortunse at tbe gold waebings, mostly oolored msn, soms of them quite hlack, who a few years ago belonged to the laboring classes, but wbo now count thsir france by millions (I do not sxaggerate) and kssp their carriages; but tbsse riches sre ssldom employsd by these "*enfans du pays*" for ths good of the country thsy should juetly cherish, and away from which they could not live. Tbe Administration psrseveree in cntting roads throngh the bush, but the sinews of war are wsak, and the high-roads to ths interior are still the rivere and cresks; and evsn from tbe banks of these, throngh their own land, to the placers which havs givsn them eucb immenee fortunes, these fortunate men do not think it necessary to make a reepectable pathway. The original tracks made by the explorers years ago with iheir sabere and hatchsts, lsaving just effiicisnt room for a man to pase, still exist, and to tbis day are kept opsn by the eeme means only."

Tbe Consul etatee that a company has engaged in an attsmpt to extract gold from the rivere themselves. It ie considsred that gold ie to bs found in tbs rivsre of Frenoh Guiana in much greatsr quantities than on the land; tbat the heavy particlss washed down from the monntains by tbe rains remain in the beds of ths rivsrs, while the lighter onee and ths duet bave bsen scattsred over ths plains. Thsee rivers are rapid snd deep, and the bede are interlaced oy roots of trees and encnmbsred by rocks; bnt it is thought that the difficultiee may be oversome, and mnch more gold be obtained than on the banke and in the plains. It may he that in some casss the watsrs must be turnsd ont of their natural cbannels and ehafts sunk; but it ie stated that an attempt will now be made to get at the treaenrs suppoeed to lie waiting for enterprieing eeskere. Tbe Conenl gives the following tranelation of instructione farnished to tboee engagsd in tbis work: "The first etreame to explore will be the Oyac, the Orapa and the Comte, whoee bede are known to be rich in gold, for placere abonnd along tbeir banks wbicb have been very enccessful. Their proximity aleo to Cayenne will emooth many difficultiee towards an eetabliebment.

"The prospection will be carried on as follows: A emall eteamer, abont 40 feet long, will be eent out to Cayenne, drawing not more tban two feet water when not working over the gold bede, eo that it may paee over everything. It will be furnisbed with powerful windlaeees to aseist in breasting the currents, and over the stern will be placed a eteam winch, witb drags for lifting the ore which may be displaced at the bottom of the river. At tbe steru there will also he another machine, with teetb, called a 'perforateur,' worked aleo by eteam, ite action on the bed of the river being of two kinde, viz: perpsndicular, where qnartz or rocks are met with, in order to crush them and penetrate; and horizontal and circnlar, ou the surface of soft earth or gravel. It will possees an inepiratory power like a pnmp, oepable of bringing up the ore, which will be emptied into an iron well in a barge towing astern of the eteamer. A diver, with apparatus complete, will aleo be attached to the expedition. On reaching that part of the river to bs prospected the diver will dsscend and examine the bottom of the river, and report upon the obstaclee in the way of tbe drage. No matter what tbey may be, wbether large etones or roots of treee, an attempt ehonld alwaye be made to remove them before einking the drage. When the bottom is clear, the drage ehonld be lowered and made to penetrate to tbe 'terrain vierge,' and the ore brought np mnst be cast into the well in the barge astern, while the eteamer shonld he worked from one eide of tbe river to the other in a zigzag manner. An iron grating ehould be placed over the well, through which the ore is to bs thrown. Should this trial of the nearer rivere to Cayenne turn ont snoceesful, the prospection of the larger onss of Sinnamary and Approuague will be attempted in a eimilar manner."—*London Times.*

Lead-Boring Insects.—M. Bode writes to *Dingler's Journal* that he bae several timee had occasion to obeerve it in lead chambers. Tbe culprit ie *Sirex spectrum*, an ineect with uncommonly powerful biting apparatus, and a prong-like prolongation of the after part of the body. In the trenches at Sebastopol lead balls were found perforated; the sheet lead on which M. Bode obeerved the ineect's action wae 3 and 5 mm. thick. From a forester's etatement it appears that tbe ineect boree its way especially into freeh pine wood. It therefore attacks the pine used for the outer walle of the lead chambere in eulphuric acid worke. On meeting the lead it continues its operations, producing a perfectly round hole, which ie contracted conically in front. When the lead plate is perforated tbe insect is, of conrse, killed by the ieening vapor and acid. Tbe insect doee not enter old or dry wood, apparently, eo that tbie ehould be ueed in constructing lead chambers.

The Engineer.

Water Power by the Pound.

At Hull, in England, the aeeociation formed eome time since to furnish water power to any one who wonld pay for it, bas completed ite arrangemsnte and ie rsady for businsss. In onr Englieh exchangee we find the following interssting facte concerning the enterpriee: In the year 1872 an act of Parliament was obtsined for tbe purpoee of eetablishing, at Kingeton-npon-Hull, what was termed in tbe prsamble of the act, "a syetem for applying motive power by hydraulic prsseure to watereids and land cranes, nsed for the pnrpose of raieing and landing goods, and for working dock gates and othsr mschinery." It aleo antborizsd tbe abstrsction from the old harbor at the river Hull, an amount of water, not sxceeding 1,000,000 gallons a day, for dietribntion within the company'e district, for which a paymsnt wae to be made to the corporation of £12 10s per annum for each quartsr of a million gallons, ths water to bs used for no otber purpose than as a motive power, except with the oonsent of the oorporation. A eix-inch pressure main hae been laid from the northern bonndary of the defined area, near the Cottingham drain, in a enutherly direction along Wincolmlse, Trippett, Dock Office row, under tbe old dook baein (whicb forms tbe esetern, or River Hull entrance to the Quesn'e dock), and crossing thie entrance it ie laid along the whole lengtb of Higb etrest, terminating close to the western approach of the Sonth bridgs aoroes tbe river. The length of prsesure main laid, exolueive of the dock croeeing, is altogstber 1,485 yarde, that on the nortb eide of the dock entrance bsing 673 yards in length, and that on the eouth eids 812 yarde. In laying this main many obstructions were met with, in tbe shape of old sewers, gas and water pipes, gullies, etc., all of which had to bs avoidsd. Thie involvsd much careful arrangement of bsnds and irregular pipes, and the difficulties wsre increassd, se the streete tbrough which the works were carried ont had a bsavy goods treffio over them, and in msny parte, sspscially in High strest, wsrs very narrow. An sngine house has bsen built to receivs, eventnally, four 60-borse power enginee. Ae the gronnd beneath thie site was silty and treachsrons, tbe fonndatione had to be carrisd down 24 feet before a good bottom wae reachsd on hard olay. Tbe footings of the walls are built ou a eeriee of arches carried on concrete piers, wbich made sonnd and economical work. Tbe engine house ie covered by a cast iron tank. Two paire of 60-horee power, high preesure, horizontal pnmping engines have heen erected, capable of pumping about 300 gallone per minute at 700 pounde preseure per square inch, with steam at 100 pounde preseure, supplied by two Lancashire boilere, fitted with the most approved appliancee. The water eupply from the River Hull ie filtered. One accumulator ie erected at the pumping etation in Machel etreet. It has a diameter of 18 inchee, and a stroke of 20 feet. The case ie loaded with 65 tone of slag and sand, wbich gives a preeeure of 600 pounds per inch in tbe main. Tbe accnmulator case and cylinder reet on concrete piere carried down to the solid clay, and ere enclosed in a brick tower. The snpply of water ie obtained from the River Hull, and is pumped throngh a 10-inch euction pipe into the tank over the engine honse. The distance from the river to the pumping eite ie 125 yarde, and the total hight of the lift from low tide level to top of tank ie 35 feet. A oentrifugal pnmp (in dnpliocate), fixed in the engine houee, raisee tbe water from the river to the tank. The water power eupplied by the company will he paid for by the ooneumer at ratee dependent on the amount of water used. The following tariff hae been issned by the company: One crane in one warehonse, £52 per annum; two cranes in one warehouee, £94 per annum; three oranee in one warehonse, £132 per annnm; and four cranee in one warehouee, £166 per annnm. Each orane will heve a counter attached to it to regieter the amonnt of work done. Hydraulic power ie alwaye and instantly available to meet the requiremente of the conenmer, and at a cost to him only in proportion to the power abeolntely coneumed, in the eame way that he paye for gas, or the ordinary dometio water service.

An Effort to Preserve the Main Exhibition Building.—Tbe Philadelphia *Ledger*, of the 3d inet., says: Yesterday, at the Board of Trade roome, the preliminary etepe were taken toward the permanent preservation of ae much as possible of the ntility and beanty of the Centennial exhibition buildinge and gronnds. Some euch undertaking wae foreehadowed in tbe *Ledger* of Monday. The meeting wae called at ehort notice, hy individual invitatione to ae many persons ae conld be easily reached within the time. The immediate enbject, as laid before the meeting by the Hon. Morton McMichael, who presided, was to consider the desirablenese of retaining permanently, by purchase, the main building, or eome characteristic portion of it. Reeolutions were adonted in favor of organizing a etock company for the pnrpoee and for the appointment of several prsparatory committees. The enggeetion has taken etrong hold of a nnmber of energetic and influential men, who have expreseed their readineee to give the undertaking both moral eupport and material aid.

Levee Building.

As is generally known, the United States is building a levee on the San Diego river to turn the water into False bay. There has arisen some controversy concerning the strength of the levee, and John H. Weeden writes to the San Diego *Union* upholding it. We do not propose to take part in that controversy, but quote from Mr. Weeden's letter some facts concerning the dimensions of certain levees which have proved effective in other localities. Levee building is one of the great questions with our engineers and agriculturists, and the collected information will be generally valuable. Under date of Washington, July 2d, 1874, a board of engineers was convened for the purpose of examining into and reporting upon the levee system of the Mississippi river. After a careful study of the whole problem they submitted their report in January, 1875. This report is exhaustive of the subject, and for accuracy of research and weight of authority is undoubtedly entitled to an equal place with any report that has ever been made. The following excerpts are from this report as printed in the "Report of the Chief of Engineers, U. S. A., for 1875:" "In 1851, the levees of Louisiana usually had the crown equal to the high, with slopes of 1 on 1. The present formula for cross-section is, the crown equal to the high, with slopes of 1 on 5. The levees of the State of Mississippi have crowns of 5 feet, with slopes of 1 on 6 toward the river and 1 on 2½ toward the swamps. Arkansas levee laws require for every foot in high 1 foot wide on top, and in addition 7 feet base. The section recommended in the 'Physics and Hydraulics of the Mississippi' for levees of moderate height is, the crown equal to the height, with slopes of 1 on 3 on the river side, and 1 on 2 on the land side. For the immense levees required to close old bayous it is important to distribute the weight, and a crown of 6 feet with a front slope of 1 on 3 and a rear slope of 1 on 4 seems to be sufficient unless the soil is very sandy. The last Yazoo pass levee was 40 feet high, its crown was 10 feet, with a front slope of 1 on 5, and a rear slope of 1 on 3. The Hushpuckana levee was 43 feet high, its crown was 8 feet with slopes of 1 on 3. Both of these levees resisted the flood of 1874."

Leaving the United States, the following from the "Physics and Hydraulics of the Mississippi," giving the dimensions of the principal levees in Europe, is interesting for comparison. "The French dikes on the Rhine between the Black Forest and the Vosges mountains, where the height is 7 feet, have a width of 10 feet, the slope toward the river being 1 on 2, and toward the land 1 on 1½. The dikes of the Rhine in Holland, when near the river bank and used as roads, have a width of 20 feet on top when 16 feet high, a slope of 1 on 3 on the river side and 1 on 1½ on the land side. The outer slope, when exposed to running ice, is reveted with brick or facines. When the dike is not near the river bank and is not used as a road, the width is 6½ feet. The dikes of the Po (those of the Adige are generally the same) are 2½ feet above the highest flood mark; usually the width is equal to the height with slopes of 1 on 2."

These examples might be continued almost indefinitely, but the foregoing are deemed sufficient for our present purpose. I add, however, that this board, as the result of its studies, recommended the following cross-section to be adopted where the levees are less than 10 feet in height: Width on top equal to the height, fore slope 1 on 3, rear slope 1 on 2.

The following table shows at once the comparitive dimensions in the cases cited, the levee in each case being assumed as 6 feet high, this being the case with the San Diego levee:

LOCALITY.	Width of top in feet.....	Width of base in feet.....	Area of cross-section, ft..	Weight of material per linear foot.
Mississippi River, Louisiana.....	6	42	144	14,400
Mississippi River, Mississippi.....	5	56	183	18,300
Mississippi River, Arkansas.....	6	48	162	16,200
Recommended in "Physics and Hydraulics of Mississippi River"...	6	36	126	12,600
River Rhine, French dikes.....	10	31	123	12,300
River Rhine, Holland.....	6½	33½	120	12,000
Po and Adige.....	6	30	108	10,800
Recommended by Warren's Board.	6	30	126	12,600
San Diego.....	23	41	192	19,200

NOTE.—The weight of earth is assumed in each case to be 100 pounds per cubic foot.

THE MARGUERITE BRIDGE.—The *Moniteur Industriel Belge* says of this bridge, which was opened in April last: The total length of the bridge is 570 metres, and its width 17 meters; this bridge is formed of six arches, three at each side of the river, of which the openings are respectively 74.83 meters and 88 meters. The centers have a radius of 135 meters; they are of wrought iron, and bear plates on which rest the macadam and the wooden pavements. The construction consumed 7,000,000 kilog. (15,400,000 pounds) of wrought and cast iron, 40,000 cubic metres of masonry, among which were 4,500 of granite, and 5,000 of other kinds of cut stone.

A BRIGHT LIGHT.—A remarkable lantern now in course of erection on Galley Head, a promontory of Ireland, will soon be completed. It will consume 1,300 feet of gas per hour, and will be visible during foggy weather. Its light will equal that of about 2,000,000 candles.

Good Health.

Pure Air.

Time was—a long time before Adam had birth—
When animals could not exist upon earth;
The plants then had plenty of light, heat and food,
But the air wanted power to vitalize blood.

In the time through which this world's mutations have ranged,
The conditions of air have essentially changed;
And the plants which were once so gigantic in size,
Have been dwarf'd down to what we behold with our eyes.

In our coal mines, extended such depths underground
The solidified growths of that period are found;
Light and heat were thus stor'd, on a provident plan,
For the future convenience and comfort of man.

Air now is a fluid all animals breathe,
From the insect above to the worm underneath;
And the deep-swimming fish, far remote from the sky,
Without air in its water would instantly die.

To draw in a full breath is the work of about
Two seconds of time, and the same to breathe out,
But, before it comes back, the air taken in
Has been changed by its contact with blood through the skin.

The skin I now speak of, adapted to line
The inside of the lungs, is a membrane so fine,
To and fro through its texture it suffers to pass
Components of air, by the learned called gas.

Thus the air in the course of the moment it dwells
Diffus'd through the lungs, in the millions of cells,
Loosing oxygen gas, in exchange, one may say,
Receives carbonic acid and takes it away.

When people stay long pent up close in a room,
Replacing what oxygen gas they consume
With carbonic, the blood, which requires to be fed
With oxygen, gets the carbonic instead.

Hence, alas! comes the typhus, our deadliest pest,
That steals on its prey while securely at rest;
Hence, chiefly, consumption, that scourge of the lung,
Which so often the human nest robs of its young.

Prevention of fever—beneficent phrase!
How to do it our statesmen seem still in a haze;
If they do mean to do it, I'll tell them a plan—
Prevent poverty, ignorance, crime, if you can.

There will always be very poor people, 'we know,
But don't you have to answer for making them so?
To the rights and the duties of labor give heed;
Promote self-reliance; help only in need:

Let the people themselves understand how it comes
That consumption and fever are rife in their homes;
The invisible air make them clearly discern,
And how they may breathe it in purity learn.

Abandon the fever nests known in your town,
Give more space in your street-ways by pulling them down; [dwell,
Purchase acres outside, build where workmen may
With their children and wives, in a home, not a hell.

For these homes they'll pay rent; but provide, at the charge
Of the public, a building, capacious and large,
Where men may resort for a lounge or a treat,
And the sexes on festive occasions may meet.

But, of all things, let all men have part of each day
For out-of-door exercise, study and play:
Supply proper means of so using their time, [crime.
And you'll keep them in health, and in freedom from

—*A. Power, in Sanitary Rhymes.*

PRESERVATION OF THE HAIR.—When the hair grows scantily, naturally, the following lotion may be used three or four times a week, in the morning: Eau-de-Cologne, two ounces, tincture of cantharides, two ounces; oil of rosemary and oil of lavender, of each ten drops. When the hair becomes thin from illness, or other causes, use the following recipe: Mix equal parts of olive oil and spirits of rosemary, add a few drops of oil of nutmeg, and anoint the head very sparingly before going to bed. When actual baldness is commencing, use the following pomade: Macerate a dram of powdered cantharides in an ounce of spirits of wine. Shake it well during a fortnight and then filter. Take ten parts of this tincture and rub it with ninety parts of cold lard. Add a little essence of bergamot or any other scent. Rub this pomade well into the head night and morning. In ninety-nine cases out of a hundred this application, if continued, will restore the hair. When the hair, after being naturally luxuriant, begins to grow thin, without actually coming out in particles, use the following recipe: Take of extract of yellow Peruvian bark, fifteen grains; extract of rhatany root, eight grains; extract of burdock root and oil of nutmegs (fixed), of each two drams; camphor dissolved with spirits of wine, fifteen grains; beef marrow, two ounces; beat olive oil, one ounce; citron juice, half a dram; aromatic essential oil, as much as sufficient to render it fragrant; mix, shake into an ointment. Two drams of bergamot, and a few drops of otto of roses would suffice. This is to be used every morning.—*Michigan Farmer.*

TO PREVENT THE SKIN FROM DISCOLORING AFTER A BLOW OR A FALL.—Take a little dry starch or arrowroot, and merely moisten it with cold water, and lay in on the injured part. This must be done immediately, so as to prevent the action of the air upon the skin However, it may be applied some hours afterwards with effect. I learned this when resident in France. It may already be known here, but have met with none among my own acquaintances who seem to have heard of it. Raw meat is not always at hand, and some children have an insurmountable repugnance to let it be applied. I always make use of the above when my children meet with an accident, and find that it keeps down swelling, and cleanses and facilitates the healing of scratches, when they happen to fall on the gravel in the garden.

Oatmeal in the Household.

In Great Britain children of all ranks are raised on an oatmeal diet alone, because it causes them to grow strong and healthful, and no better food can possibly be found for them. It is also quite as desirable for the student as for the laborer, and for the delicate lady as for her hard-working sister. Indeed all classes would be greatly benefited by its use, and dyspepsia, with all its manifold annoyances, can be kept at a distance. Oatmeal is most substantial food. It is said to be better than veal, pork or lamb, and quite equal to beef or mutton, giving as much or more mental vigor, while its great desideratum consists in one's not becoming weary of it. It is as welcome for breakfast or tea as is wheat or Graham bread. It can be eaten with syrup and butter as hasty-pudding, or with cream and sugar like rice. It is especially good for young mothers, upon whose nervous forces too great a demand has been made, and they lose the equilibrium of the system and become depressed and dispirited. Oatmeal requires to be cooked slowly, and the water should be boiling hot when it is stirred in.—*Baldwin's Monthly.*

MAKING BEEF TEA.—After removing all fat, cut up three pounds of the best beef into pieces the size of a small cranberry, put it into a stone china bowl and pour over it one pint of very cold water; let it stand in a cool place for an hour or so. This brings out the juice. Fit the bowl into a saucepan of water that will allow the bowl to rest in it without quite touching the bottom, and steam in this way for two hours. Do not strain the liquor, because this process will remove more or less of the little particles of beef, which are very essential to the value of the tea. Pour and press all the fluid from the beef. It may be salted and given hot or cold. Should there be any fat on the tea, set aside until perfectly cold, when it can all be removed from the surface in a flake. For a child use two pounds of beef; for a baby one pound, to same amount of water. If the patient's stomach is very irritable, so that large quantities cannot be borne, you may resort to beef extract for nourishment; it is a more concentrated article of food, but not near so palatable as rich beef tea. Beef extract is made of lean beef cut in small pieces, and put into a bottle without any water or anything else. Set it into a kettle of water, which is to be kept boiling for two hours. Remove the bottle, subject the meat to slight pressure to remove the fluids, and season with salt.—*Country Gentleman.*

FOR THE protection of workmen who are obliged to handle lead and mercury compounds, the French chemist Melsens, recommends daily but very small doses of iodide of potassium taken internally. Melsens affirms that this substance dissolves the lead or mercurial compounds that are absorbed in the system and effects their rapid removal.

Useful Information.

Heating with a Grate.

We find in the Boston *Journal of Chemistry* some suggestions concerning the use of grates and how they should be constructed: An ordinary room, say 15 feet square and 10 high, occupied for day use only, can be fairly warmed and ventilated by one open grate fire; but this grate must be so constructed and set as to have an air space behind and around it, and this space must be supplied with out-door air by a special shaft or an opening through the outside wall, in either case regulated by a damper. The direct radiation of the fire will heat the room and the occupants to some extent, and the cold air introduced at the back will be warmed and pass out through openings in the chimney breast to the ceiling level, where it will flow to the opposite side of the room and be drawn down to and across the floor, a part of it feeding the fire or passing up the smoke flue over the fire, and the remainder going up the face of the chimney breast and circulating as before. Thus the room will be fed with a constant supply of sweet air, and a corresponding portion of the vitiated air will be removed, while the whole atmosphere will be gently but effectually stirred, and the temperature kept evenly warm in all parts. Those who need most heat can sit near the fire and thus have a larger share of the direct radiation, while the warmer-blooded can remain near doors or windows without fear of being chilled on one side and overheated on the other. There are several grates patented in England which act in the way described, and their introduction here is only a question of time. In fact, the original Franklin stove was arranged on the same principle, though the modern one is like it only in name, being simply a portable grate with no supply of fresh air except such as is drawn into the room through doors and windows.

TO MAKE OIL-SKIN.—1. The manner of making oil-cloth is very simple. Place some good resin or gum-lac over the fire in drying linseed oil, till the resin is thoroughly dissolved and the oil brought to the thickness of a balsam. Spread this upon canvas, or any other linen cloth, so as fully and entirely to glaze it over; suffer it to dry perfectly, and it will be found impenetrable to wet of every description. To give a color to this varnish, grind the blue, green, etc., with the last coat that you lay on. 2. A better method than the above is first to cover the canvas, etc., with a liquid paste, made with drying oil in the following manner: Take spanish whits or tobacco-pipe clay, which has been completely cleansed by washing and sifting it from all impurities, and mix it up with boiled oil, to which a drying quality has been given, by adding a dose of lithargs one-fourth of the oil. This mixture, being brought to the consistence of thin paste, is spread over the cloth, etc.; when the first coating is dry, a second is applied. The unevenness occasioned by the coarseness of the canvas, or the unequal distribution of the paste, are smoothed down with pumice-stone, reduced to powder and rubbed over the canvas with a piece of soft serge or cork dipped in water. When the last coating is dry, the canvas must be well washed in water, to clean it; and when dry, a varnish composed of gum-lac dissolved in linseed oil boiled with turpentine is applied, and the process is complete. The color of the varnished canvas thus produced is yellow.

Hints for Practice.

ZINC may be hardened to any degree desired by introducing ammonium chloride into the zinc while in a state of fusion, 100 to 200 grammes to the kilo.

A VERY hard metal, suitable for cutting-tools, is made by adding tungsten to gray iron while in fusion, in the proportion of 28 grammes of the former to 4,077 kilos of the latter.

A GOOD cooling for ontside brickwork is made by mixing 20 parts clean river sand, one part quicklime and sufficient linseed oil to form a thin paste. This is also useful as a cement for broken stone, as when dry it becomes exceedingly hard.

A GOOD varnish for white wood may be made by dissolving three pounds of pure white shellac in one gallon of spirits of wine, then straining and adding one and one-half gallons more of spirits. If the shellac is pure and white this will make a transparent covering for white wooden articles.

A SPONGE may be bleached almost snow-white by the following process: Soak the sponge in dilute muriatic acid for 12 hours, wash well with water to remove the lime, then immerse it in a solution of hyposulphate of soda, to which dilute muriatic acid has been added a moment before. After it has bleached sufficiently remove it, wash it again and dry it.

THE following recipe for a beautiful red ink is given by Mstra, of Paris: Dissolve 25 parts, by weight, of saffranine in 500 parts warm glycerine, then stir in carefully 500 parts alcohol and an equal quantity of acetic acid. It is then diluted with 9,000 parts water, in which is dissolved a little gum arabic.

THE following jeweler's alloy was not long since patented in France: Copper, 720 parts; nickel, 125 parts; bismuth, 10 parts; zinc, 90 parts; soft iron, 20 parts; tin, 20 parts. This is said to form a fusible, malleable metal, easily worked by a silveramith. It resists the oxidizing action of the air and is capable of being soldered.

ARTIFICIAL ivory is produced as follows: Boil one pound of ivory dust with water to a jelly; to this add one ounce each of zinc oxide and shellac dissolved in alcohol. Pour the pulpy mass into forms and allow it to become dry in the air, after which it is subjected to hydraulic pressure. The finished material may be cut, sawed and turned as well as natural ivory or bone.

AN adhesive which, as far as color and durability is concerned, is affirmed to surpass that made from gum arabic, is made according to the following recipe, viz: Milk is curdled by the addition of acetic acid (vinegar) and the precipitated casein, after being thoroughly washed with fresh water, is dissolved in a cold, saturated solution of borax. The result is a clear solution of syrupy consistence, possessing, upon drying, a fine luster and highly adhesive qualities. This adhesive is recommended for a variety of uses.

NEW USE FOR PETROLEUM.—A new use to which petroleum can be put is found in the preparation of the beds for the growing of tobacco. Hitherto it has been the practice to burn off the remnants of the old crop before setting in the new by means of cordwood, as much as 30 cords of wood being necessary to a bed of 1,000 yards square. It has now been found that the work can be more quickly and better done by means of refined oil, one gallon being sufficient to treat 100 square yards with. The way to use the oil is described thus: The bed is first to be cleared off as if for burning by wood in the old way. After this is done the oil must be applied evenly and uniformly from a watering pot. As soon as the oil is thus applied, the match is to be touched and the job is done. The latter part of the work must be done quickly, in order to avoid danger to person. If it be desirable to burn deeper, before applying the oil, hoe up the bed, and then proceed as above directed. The oil will penetrate the soil as far as it is worked by the hoe, and will burn as deep as the oil penetrates. It is thought that the oil can be used with equal value in the preparation of ground for early vegetables, by warming it and giving the stimulus supposed to be given by guanos, besides being destructive to worms and insects—*Titusville Herald.*

TABLE OF CONTENTS.

GENERAL EDITORIALS.—Mors of the Mines snd Mschinery of Eureks; Mechanicsl Ore Concentration snd Sepsration, 265. Pacific Coast Coal Mines; Wster for Boilers from Mines; Gems and Precious Stones; Items of Interest from the Mines, 272. Academy of Sciences: Improved Pastry Buresu, 273. Remarks on Quicksilver; Notices of Recent Patents; Patents snd Inventions, 276.

ILLUSTRATIONS.—Rollers with Componnd Levers for Crushing Ore, 265. Feltsr's Pastry Buresu, 273.

CORRESPONDENCE.—Tybo District; Alpine County—Its Mines snd Resources, Psst, Present and Futnre, 266.

SCIENTIFIC PROGRESS.—New Opticsl Experiments; Petroleum as s Lightning Conductor; Ths Vernation in Oak Lesves; A Substitnts for the Metric Sy-tem; Combustible Esrth; A New View of Glacisl Action, 267.

MECHANICAL PROGRESS.—Welding Iron; The 100-Ton Gnn; Novel Mods of Strengthening Cast-Iron, 267.

MINING STOCK MARKET.—Ssles st the Ssn Francisco, Pscific snd Californis Stock Boards; Notices of Assessments; Meetings snd Dividends; Review of the Stock Msrket for the Week, 266.

MINING SUMMARY from vsrious counties in California, Nevads, Idsho Utah snd Arizons, 269-70-76.

THE ENGINEER.—Water Power by the Pcund; An Effort to Preserve the Msin Exhibition Building; Levee Building; The Marguerite Bridge, 270-71.

GOOD HEALTH.—Pure Air (Poetry); Preservation of the Hair; To Prevent the Skin from Discoloring sfter s Blow or a Fall; Oatmeal in the Honsehold; Msking Beef Tea, 271.

USEFUL INFORMATION.—Hesting with s Grate; To Mske Oil Skin; Hints for Prsctice; New Use for Petroleum, 271.

GENERAL NEWS.—General News Items snd Miscellaneous Paragraphs, on 276 snd other pages.

MISCELLANEOUS ARTICLES.—The Metric System, 266. Heil Gate and the New Hallett's Point Channel; The French World's Fair; Gold Mining in French Guians; Lesd-Boring Insects, 270.

NEW ADVERTISEMENTS.

Silver Pisted Amalgsmating Pistes, E. G. Denniston, S. F.; The Trsde Engine, Mscus C. Hswley & Co., Ssn Francisco and Sacramento; Cascsde Blue Grsvel Mining Co.—Meeting.

SOUTH AMERICAN MINES.—The following, concsrning some new mines in which several residents of San Francisco are interested, we take from *La Republica* of August 11th: "Yesterday there waa taksn to the mint for examination some samples of gold from Catapilco, from the works recently established there. From the analysis made it waa decided that the gold waa of the highest grade. The samples shown were very numerous and some of the nuggets were larger than an almond. The works have been started with great activity at Catapilco, and from calculations made, each laborer produces from $40 to $60 in gold per week. When all the machinery is in place and the whole work thoroughly organized, it is expected that the yield will be from two to three times as great."

THE WATER COMMISSIONERS.—Major Mendell, engineer of the board of water commissioners, s still engaged with a party of engineers in locating reservoir sites in the foothills of the Sierras. The party are now at work in the vicinity of Anburn, and expect to complete their work in a few weeks. A line of levels has been run across the intervening country toward the city to determine the best route for a pipe line and get the pressure at various points. The figures of this survey will be made the basis for specific proposals from each of the parties having sources of water supply, or water rights for sale.

MACKEY & FAIR are building a new tailing flume from the point where it atarts in Gold canyon to the Ophir mill.

Pacific Coast Coal Mines.

The Reduction in Wages.

There has of late been considsrable dspression in our coast coal mines, which, though advantageous to purchasers, has been detrimental to the local coal mining interests and to the miners. The largs number of vessels from England and Australia which have been arriving for some time to carry off the wheat, came with cargoes of coal. This coal was bronght in most instances merely as hallast. Under these circnmstances of conrse the forsign coals flooded the market here and were sold at reduced rates, so that local coals were in no dsmand. Prices fell slowly until Angust and Septsmber, when they came down more suddenly. The mines at Mount Diablo and those at Seattle and thereabouts, after coming down in price a little, ceased production instead of reducing pricea further. Of conrse after they stopped sending the product to market they had to cease work on the minee to a great extent, and many men were thrown out of work.

The customary price for cutting coal on this coast haa been one dollar per yard, thongh in a few minee where unusual obstrnction existed, the price haa been one dollar and twenty-five cents. Not long since the coal companies at Mount Diablo, comprising the Black Diamond and Pittsburg, notified the men that from the first day of Octoher the price of cutting coal wonld he reduced twenty-five cents. The companies claimed that with the dull market and extremely low nrice of coal, by reason of great competition, they could not afford to keep up the old estahliahed ratea of one dollar per yard for cutting.

The minera demnrred to this proposal, and several meetings wsre held by the miners of Somersville and Nortonville to consider the proposition. At last it was determined to inform the auperintendenta that they wonld resume work at a reduction of twelve and one-half cents per yard, that being one-half the reduction demanded hy the companiea. Accordingly, a formal proposition was made by a committee selected hy the workingmen, bnt they were informed that no compromise whatever would he made.

This state of things lasted for a few days, when both companiea decided to close down the mines. Both companies removed their lower level pnmps and were proceeding with preparationa to remove the other pumps and underground machinery. We nnderstand now, however, the miners have finally consented to the reduction proposed hy the compaaies, taking into consideration the fact that the mines have been running on only ahout half time for a year or more past, and it waa probsble that the owners wonld be compelled to cheapen coat of prodnction if they kept their coal in the market at all.

Under the circumstancsa it seems mnch more reasonahle for the men to consent to the redno tion rather than to have heen stnbborn and had the minea close down altogether. Hnndreds of poor families would have been thrown ont of employment at a had season of the year. Moreover, most of the men are unaccnstomed to other kinds of work and there are plenty of miners out of employment already. Neither the Renton ncr Talhot companies, in Washington Territory, are at work, and the Seattle coal company haa for some time heen redncing the number of ita employees, discharging the nnmarried msn and retaining those of family.

Coal is now as cheap in this city as it ever has been. The foreign coala are preferred to our own at equal prices, and as long as the wheat ships continue to come, prices will hardly recover. The local mining companiea hope for an advance after the firat of January which will result in a reaumption of work. Probahly, if the market warrants it, the old pricea for coal cutting will he paid and the miners have shown better aense in accepting the situation than they would had they kept up a strike and compelled the companies to lose more money hy letting the mines lie idle altogsther. Cheap coal has long been the need of thia coast, and purchasers have now no cause whatever to grumhle, although the immediate reault of the reduction in price worka hardship to mining companies and miners.

The present prices of coal in San Francisco are about as follows: Australian coal, $7.75@$8.00, to arrive; Liverpool steam, $7.00; Cannel, $13; West Hartley, $9.00; Scotch splint, $7.50@$8.00; Pittsburg lump, $14; Cumberland, $13@$14; Lehigh, $14. From ship, the pricea are quotable as follows: Scotch splint, $11.50@$12; Lshigh, $15; Egg Hard, $17@$18. Prices for Pacific coast coals are aa follows: Coos Bay, $9.00; Mt. Diahlo, $5,75@$7.75; Bellingham Bay, $8.00; Nanaimo, $8@$9; Wellington, $9@$9.50; Seattle $9@$10.50. These are of course wholesale pricea, those charged at the small yarda for domeatic conaumption heing considerably higher.

IMPORTANT MINING SUIT SETTLED.—The conflicing claims to the Dolores mine, which have been in litigation for the past five years, were a short time since finally aettled by a compromise and a consolidation of all the conflicting titles. This mine is situated in the Wilson mining district, Esmeralda county, and is believed to he a rich and valuahle piece of mining property.

THE Amador *Ledger* underatands that the last clean np of the Amador Consolidated mine, of Sutter Creek, realized $27,000.

Water for Boilers From Mines.

Too great care cannot bs observsd by mill owners and enginssrs, especially in new mining locations, in carefully examining the water which they propose to introduce into their hoil'ers for making steam. Boilers are vsry soon estsn away hy some waters, often leading to disastrous sxplosions, hut more frequsntly causing a rapid deterioration of its valus, which soon involves the cost of a new one. Watsr from mines whsre coppsr pyrites are present evsn in smsll quantities, usnally contain more or less sulphats of copper in solntion, which causes no little corrosion of the boiler plates, and ia attended with a deposition of spongy metallic copper. All who are acqnainted with the usual wet process of assaying copper must he especially aware of thia action.

Mine waters are rarely free entirely from aaline or acidnloua constituents such aa will produce more or less corrosion upon boilera. Soft waters from the surface also often carry a oonsiderahle amount of organic matter, free alkali or carhonic acid in solution, which produces a degree of corrosive action.

The perishahle nature of iron when in alternate contact with air anu water, used in any connection, is known to every one, and no engineer shonld fail to keep a watchful eye npon hoth the never ceasing deterioration of the boiler and the kind of water used for making steam. A careful analysis of the usual supply of water from time to time could scarcely fail to be of use in gniding the engineer to the proper corrective agents for rendering the water employed as harmless as possihle. Hard water containing bi-carbonate of lime may be readily precipitated, throwing down the lims as a nsntral carhonate, and leaving clear water, which will no longer form an incrnatation when hoiled. Soft waters acting corrosively when boiled may be corrected hy the addition of a little lime, and acidulous waters may he as readily corrected by addition of alkali. An analysis of any water which acts corrosively on hoilera will almost alwaya enable the chemist to point out some simple method of correcting it, and at a nominal expeuse.

In the Eastern States and in Enrope persons are employed whose exclusive duty is to make analyses of the water used in locomotives along the routes of the principal railroads, for the purposes referred to above. In the mining districts where the water is apt to change from time to time the more care should he taken, and we have no doubt it wonld pay in the long rnn.

Gems and Precious Stones.

[Written for the PRESS by HENRY G. HANKS.]

T. Axinite.

This mineral ia sometimes used as a gem. It crystallizea in the triclinio system. Hardness, 6.5-7; specific gravity, 3.271; lnster glassy; color clove hrown, plum blue, pearl gray; exhihits trichroiam, that is, shows three colors when seen in different directions; streak uncol ored; trsnsparent, subtransparent; fracture conchoidal; hrittle, pyro-electric, donbly refractive. The following analysis will reveal its composition: Silica, 45.00; horacic acid, 2 00; alnmina, 19.00; aesquioxide of iron, 12.25; oxide of manganese, 9.00; lime, 12.50; msgnesia, .25,=100.

B. B. axinite fnsea readily and imparts a pale green color to the oxidizing flame (boracic acid); when perfectly fnsed it becomes a dark green or hlack glass; with borax in the oxidizing flame givea an smethystine head (manganese), which in the redncing flame becomes yellowish green (iron); fused with a mixtnre of finor spar and bisulphate of potash, colors blowpipe flame green (horacic acid). It is not decompoaed hy acids, hnt when first ignited gelatinizea with muriatic acid.

Axinite ia a rare mineral. It is fonnd in the primitive rocks. At Dauphiny it occura associated with quartz, feldspar, epidote and asbestos. Thia minsral takes a high polish, and when of nniform color makes beautiful jewelry. Owing to its scarcity it is not mnch known.

Axinite takes its name from a Greek word signifying an axe, from the form of its cryatals.

CASSIAR MINES.—Dispatches from Victoria state, in relation to the Casaiar minea, that the Discovery company have made a new strike on McDame'a creek. The weather was cold and clear, with indications of an early winter. Abont 150 minera will winter at Cassiar. It is estimated that abont 100 persons have left the city dnring the past few days for Deception gulch, on Leech river, where the late gold discoveries were made.

SOME OF THE DUMPS of the Comstock minea are so large that they have to run tnnnels through them. Sets of timhere have been put in at the place where the C. & C. side-track goes through the Chollar-Potosi dnmp. As the working of the mine bringa more debris to the surface and it falls down upon these timbers and their covering, the cut will become a tunnel. Other dumps are being treated in the same manner.

THE Pioche *Record* understands that the mine in San Francisco district, Utah, recently sold hy John C. Lynch of Pioche, is proving a great bonanza. The owners are Cullen, Green, Ryan and Byram. They have refnsed $300,000 for the property.

Items of Interest from the Mines.

We give below items of interest from prominent mines, most of which are collated from the letters of ths respective supsrintendents, on file at the offices in this city. Considerable of the news is later than that procured from the interior jonrnals.

In the Con. Impsrial mine the w ater coming in at the 2000-foot level, in drift running north, has a heat of 150 dsgrses. Ths temperature in the drift is 108 dsgrees. Greater heat is expscted.

The furnaces at the Modoc mins, Inyo county, started up on the 9th inst.

In the Manhattan mine guides and tnrn-tables are completed in the center shaft; a cage is abont to be put in nse. This will enable them to run a cross-cut to the Paxton ledge and make connection with the 700-foot incline of the Panamint. When thia is completed hoisting can he commenced through the shaft from the fine hody of ore.

At the Glasgow the pump columns are being placed in the mine.

The September receipts of the Lsopard mine were $77,342, and a dividend amounting to $25,000 waa paid on the 16th.

Justice ia shipping daily 156 tons of ore to the several mills, to wit: Douglass, Woodville, Boston, Pioneer, Sherman and Excelsior, extracted from ths ore-producing atopea and drifts of 400, 500, 600 and 800-foot levels.

The superintendent of the Wells-Fargo mine is hulkheading and damming the ravine to the westward of the company'a works, by which means he is enabled to carry enough water thia winter to supply the run for the entire year. If this is successful it will save about $4,000 next yèar.

In the Consolidated Impsrial the new hlower is a success, doing splendid work—giving plenty of air in all working parts of mine. The miners now can have no excnae, and must do good work. The air from the Bullion ia gradnally working down to the 2000-foot level of the Consolidated Impsrial, cooling drifta and winzea in its course.

The object of the Emigrant assessment ia to pay off $14,000 now due, to hring water from the company's aprings to the mine, a distance of nine miles, and to remove the company's five stamp mill at the springa to the mine. On the 16th inst., Northern Belle paid her seventeenth dividend—$50,000, making $850,000 divided among atockholders altogether.

In the Empire they have connected No. 6 south crosa-cut with the raise from No 7, and commenced to drift on the ledge south and north.

A set of machinery for a 10-stamp qnartz mill, with all the pulverizing and amalgamating machinery for Panl'a dry procesa, was shipped Saturday, for Roseburg, Oregon.

The Gila letter says: I do not think from recent dev-lopments there is any question bnt the quartz helt is bottomed, and the only hope of an ore hody being fonnd is to the south of our present worka undsr the porphyry hills.

Prospecting is being pushed with energy in the Raymond & Ely. They now have a good circulation of air on the tenth level. The superintendent says: The smelting furnsce at Bullionville will be completed in a few days, and if it provea a success we can have onr hase ore reduced here inatead of shipping it to Sacramento, and save transportation on the waste material.

The water in the Hale & Noroross mine is very hot—140 degrees Fah.

Consolidated Virginia has disbnrsed in dividenda to date, $24,840,000, nr $46 per share.

In the Mansfield, south level from atation No. 1 is producing some very rich ore in fine gold and sulphnrets.

In the Genesee they are doing well; a run of 18 daya with the hatteries gave a clean-up of 432 onncea of hard amalgam retorting 150 onncea of coarse gold.

In the east drift 1800-foot level of the Julia, work has been suspended for the present, until the water is drawn off.

INCORRECT.—In justice to Mrs. J. R. Hardenherg, regarding whom a statement was made in our "Comstock Paper No. 7," we would atate that we have been shown the decree of divorce of the District Court of the 14th Judicial District of Nevada, which shows that Mrs. Hardenherg was divoroed from Hastinga in 1858, or before the Washoe excitement, and that the grounds upon which the divorce was granted was, "that the defendant, J. W. Hastings, has not provided the necessaries of life for his family during the last three years, he having the ahility so to do." Mrs. Hardenberg conld not, therefore, have received any portion of Hastinga' wealth which he accumnlated from Washoe apeculation. Mrs. Hardenberg did not marry Mr. Hardenberg nntil 1863, about five years after ahe waa divorced, so that there is very little likelihood of Mr. Hardenherg having henefited from Hastinga' wealth. Our correspondent was evidently misled in the matter, and it is no more than strict jnstice to Mrs. Hardenberg that we make thia statement.

THE Seattle coal company shipped 3,995 tons of coal during Septemher. Neither the Renton nor the Talbot companies are at work, owing to "faults" and water.

Academy of Sciences.

Remedy for the Phylloxera.

The California Academy of Sciences held its regular meeting on Monday evening last. Among the donations to the cabinet was a collection of over 100 specimens of minerals from R. H. Stretch, to whom a special vote of thanks was passed.

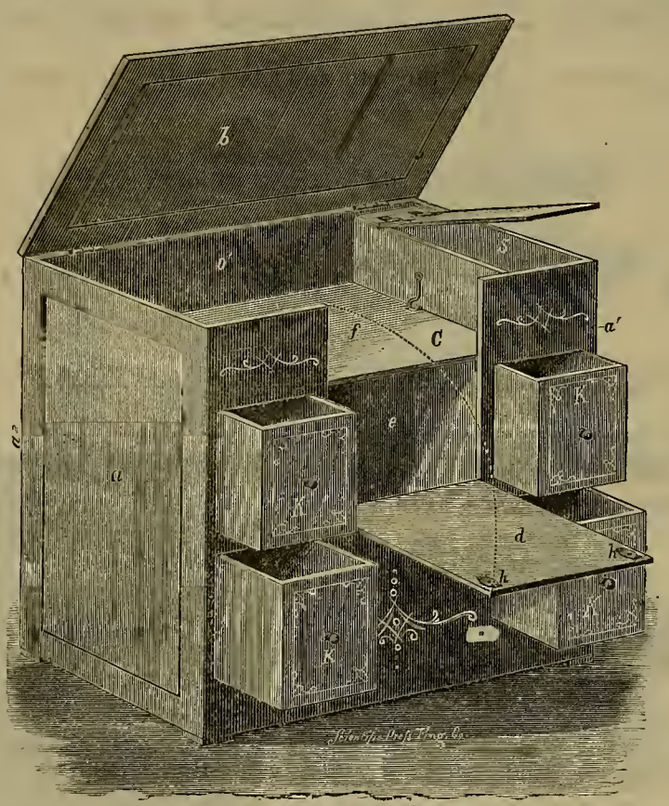
Mr. Guerin, engineer, read a paper on the mathematical determination of the minimum thickness of conduit pipes consistent with strength required to resist the hydraulic and hydrostatic pressures, etc.

Dr. James Blake read the following important paper on the phylloxera:

My attention having been directed some months ago to this new pest which so seriously threatens the destruction of our vineyards, a series of experiments was undertaken under my direction at one of our largest vineyards in Sonoma county, with the view of discovering some means of checking the progress of the disease, as it has already almost destroyed some of the most promising vineyards in that locality. At the time of commencing my investigations I was aware that the subject had occupied the attention of some of the most distinguished scientists in France for the last three or four years, nor should I have entered on the investigations with any hope of success, had I not known that the efforts of these gentlemen seem to have been directed to the destruction of the insect without having acquired sufficient knowledge of its natural history. So far as known the insect is one which goes through a series of generations without changing its form, during which many thousands of insects can be produced from a single impregnated ovum (75,000,000 have been calculated), but after a certain number of these parthenogenic generations the power of non-sexual reproduction ceases, and the development of a new form becomes necessary for the continuation of the species. This alternation of generations takes place in many of the lower tribes of animals; the different generations of the same animal being in some instances so dissimilar as to have been mistaken for different species. In the phylloxera the forms usually met with, or, at least, that had been described when I commenced my investigations, were two non-sexual forms, the nymphs and nurses, the former being a small insect with legs which allow a certain degree of locomotion, the latter being a form in which the legs are so slightly developed as to be hardly visible, so that the insect can move but a very short distance from the spot where the ovum is deposited. Besides these two non-sexual forms, whose life is entirely subterranean, there is a winged form in which the two sexes are developed, and which passes the greater part of its existence above ground. Within the last few months it has been discovered that this winged insect deposits its eggs on the leaves and bark of the vine, and from these eggs it is probable that a new generation of nurses and nymphs arises which, at least for many generations, propagate themselves on the roots of the vine without any males being produced. There were two important questions relating to this winged form of the insect which had not been decided, viz.: whether they deposit any eggs on the root or bark of the vine under ground, and the form of the insect that is first produced from the impregnated ovum. These questions have an important bearing on the means to be taken for the destruction of the insect, but unfortunately neither of them had received a satisfactory answer. In the spring of this year I presented some specimens at the microscopical society, of a form of the insect that had not been described. In my frequent examination of the roots of diseased vines during the winter, the insect was only met with under the form of nurses, which remained in a dormant state from the beginning of November to April. The first sign of a renewal of activity in the insect was the appearance of a form much resembling the nymph but rather larger, with a sort of gelatinous body, and so transparent that from ten to twenty ova could readily be distinguished in the abdomen. It was much more active than the nymphs, running about the roots with agility. My own opinion is, that it was a form of the insect directly developed from the impregnated ovum, but whether it had been hatched above the ground and had traveled down on the root, or whether any impregnated eggs had been deposited beneath the surface from which it had been produced, is not known. The same form of insect was described by Mr. Balbiani at a meeting of Academie des Sciences at Paris, about two weeks after I had exhibited it at the microscopical society. On seeing this form of the insect, the idea at once struck me that this was the phase of its existence in which it could most readily be destroyed, and believing that this form was one which was necessary for the continuation of the species, its destruction would necessarily be followed by the disappearance of all the other forms.

The Bisulphide of Carbon

Seemed to present the only agent likely to be efficacious against the insect. Owing to the extreme volatility of this substance, its vapor, when it is introduced at some distance beneath the surface, would permeate the earth in all directions over a considerable area, and thus would have a chance of reaching even the distant rootlets of the vine. Although it had been reported in France that the substance was not destructive to the insect, yet I believed that the soft, apparently undeformed, which I had just discovered, would not resist it. In order to introduce the substance beneath the ground, an iron tube was taken with a sharp steel point at one end, the sides being pierced with a few small holes near the bottom, and a piston was made which could be forced down the tube. The tube was driven into the earth for a distance of one or two feet, near the root of the vine; some bisulphide of carbon was poured into the tube, which was then filled with water, and the contents of the tube forced out into the ground with the piston. The tube was then drawn out and the hole filled up. The quantity used on each vine was about an ounce and a half of the bisulphide. This was introduced into the ground through two or three holes. The substance was applied in the end of April and early part of May, only one application being made, and in every instance to plants that were evidently suffering from the disease. The result has been, on the vines so treated the insect has almost entirely disappeared, whilst on vines that were in the same condition last year as those to which the bisulphide had been applied, but which were not treated, the roots swarm with the insect, so that none of them are likely to survive this season, at least of those that were most affected.



FELTER'S PASTRY BUREAU.

In the early part of the season no great difference was noticed between the foliage of the vines that had been treated and the others, but within the last six weeks the vines on which the insect had been destroyed present a decidedly healthier appearance. A more marked difference is observable in the roots, specimens of which I submit for inspection. It will be seen that whilst the roots of the vines to which the bisulphide has been applied present a comparatively smooth and healthy appearance, the roots of the untreated vines are rough and covered with dead and decaying bark. In both sets of roots the lower portion is generally dead, the result of the ravages of the insect during the last season; but whilst in the plants which are still infested with the insect this process is still going on and will continue until the vine is destroyed, the other roots are throwing out quite a number of healthy rootlets and are covered with a new and smooth bark, so that they will be prepared in the ensuing year to throw out a new crop of rootlets.

As regards the

Practicability of the Treatment

This presents no obstacle, as the bisulphide of carbon can be obtained now in a comparatively pure state at about 50 cents per pound; and I am confident it can be produced in a form quite suitable for use in the vineyard at a third of the price, so that the cost of the material for each vine would not exceed two or three cents. The process of applying it is simple, and can be carried out by any ordinary laborer. The time for applying it should be during the month of April, as at this season the insects that have survived the winter have not begun to lay their eggs, and experiments that have been carried on during the summer show that whilst the bisulphide is a certain poison to the insect in all its forms it does not destroy the egg. This is the reason of its reported failure in France, where probably it was not applied at the right season. By using it in the spring, at the time that the winter eggs at the surface are being hatched and before the hybernating form has commenced laying, we have the insect entirely in that phase of its existence in which it can be killed by the bisulphide; and experience has shown that at this time its destruction is completed by one application of the poison. The only place where the insect has been found on some few of the vines treated has been near the surface, where the vapor became too much diluted with the air to prove fatal, and one patch of the insect was found at a depth of more than four feet, where it was possible the vapor had not penetrated. In the course of my experiments I have discovered that the refuse lime from the gas works will kill the insect for some distance beneath the surface when it has been applied round the roots, and from what we know of the natural history of the insect it is almost certain that it will shortly die out at any great depth, when it cannot be renewed by fresh nymphs developed from the winter ova. The

Plan of Treatment

I have advised for the diseased vines is, during the winter, and as late as possible before the cessation of the rains, to apply three or four pounds of the lime refuse round the stem, drawing the earth away from the stem to the depth of two or three inches, at the same time brushing the stem for six or eight inches above the ground with train oil. Then about the middle of April to the first week in May use the bisulphide of carbon under ground in the way I have pointed out, making three holes round each vine at a distance of 18 inches from the stem, and using about two-thirds of an ounce to each hole, the holes when the tube is withdrawn being well filled with earth and stamped down.

When the vine is so far diseased as to have suffered materially in its foliage, the better plan is, I think, to pull it up. But a careful examination will detect the presence of the insect on the roots of vines the foliage of which appears quite healthy and which are bearing a full crop of fruit. In this stage of the disease the insect is not in sufficient numbers to so completely absorb the descending sap as to have prevented the formation of new rootlets, and whilst this is the case the vine can readily recover itself. Whatever may be the case in other countries, I am convinced that here the destruction of the lower portion of the roots is not caused by the direct attack of the insect, as I have found the roots dead two or three feet beyond where any trace of the insect could be discovered. Owing to the peculiarities of our climate the vines send their roots much deeper here than in Europe, and although in the older vines in the vineyard where I investigated the disease, the roots derived their principal supply of nourishment at depths from six to ten feet, I have not found the phylloxera at a greater depth than four feet, although the roots were dead as far as they could be traced, and far beyond any part that had been directly attacked by the insect. Where the vines are pretty badly diseased, I think the application of the bisulphide at the beginning of the winter, say in November, would more than repay the expense, as thousands of insects would be thus destroyed that otherwise would be feeding on the joices of the vine during the next five months. This, however, must not supersede the use of the poison in the spring at the time when the winter eggs are developed.

In the roots shown this evening the healthy appearance of the new rootlets on the treated vines is a sufficient proof of the absence of the phylloxera, although I would state that after a careful examination I have not detected a single insect. The roots that were not treated have not thrown out a single rootlet. It is needless to remark that the vines that were treated all showed evidences of being attacked by the disease last season, as is evident from the appearance of the roots, although not an insect is to be found on them at present.

Where the vines have not been already attacked, I believe the application of train oil to the stem and the gas works lime to the surface round the top of the root will protect them, or a small quantity of the bisulphide introduced near the root a few inches beneath the surface in the spring, would certainly save them from the attack of the insect.

Improved Pastry Bureau,

We illustrate on this page a "pastry bureau," recently patented through the Mining and Scientific Press Patent Agency by J. R. Felter, of San Bernardino, Cal. The invention consists substantially of a cupboard constructed with side drawers or compartments and a centrally located flour chest, the top of which constitutes a pastry bureau, whereon pastry, etc., may be conveniently manipulated.

In the cut a a^1 a^2 represent the end and rear sides of a cupboard which is provided with a hinged lid, b, in the usual way. A portion of the front part, C, of this cupboard, consists of a hinged board, d, which serves both as a lid for the flour chest, e, which is centrally located within the structure, and as a cover or door for an opening formed in the front, C, of the cupboard, just above the flour chest. The object of the opening is to provide means for easy access to a pastry board, f, which will be exposed after the lids, d and b, are opened. The board, f, is denominated a pastry board by reason of its special fitness as a table or board for the reception of the several ingredients to be kneaded together in making the cake, etc. It forms a horizontal division in said cupboard, located at a suitable distance below the top of the cupboard, and also constitutes the top of the flour chest. The depth of the flour chest may be raised according to the depth of the cupboard, its front opening being of sufficient size to permit convenient access to the flour.

The lid d, which is hinged to the side C, is of such dimensions that when swung into a vertical and closed position its upper edge shall be flush with the upper edge of the front part C, of the cupboard. The lid d, is secured by buttons h, or any suitable means. K K, are drawers arranged between the sides of the flour chest and cupboard and will be found exceedingly useful for the reception of various articles. S, is a spice box with hinged lid and temporarily connected with the pastry board by a hook, so that it can be removed when desired. To use the pastry board, the top lid, b, is swung open and held in suitable position by means of a hook, and the side lid d, swung open and down upon the front side of the cupboard.

This article of furniture for the kitchen department of a house is intended to lessen domestic labor. In using it the housewife has the articles for pastry work conveniently, and does not have to take two steps to get the things used in making pie, cake, bread, etc. Everything used for this purpose is kept free from dust, the "bureau" being specially arranged for this purpose. It has also other advantages, having four drawers, each of an average capacity of 25 pounds, in which can be placed various groceries in quantities suitable for kitchen use. It occupies no more room than an ordinary sink. The kneading board is under cover and out of the way. The flour compartment holds a barrel of flour, and the till will hold the roller, yeast powder, cake cutters, etc. Those desirous of further information can address the inventor as above.

Bullion Shipments.—Since those mentioned in our last issue, bullion shipments have been made as follows: Ophir, Oct. 11th, $33,343; Virtue, Oct. 10th, $4,492; Arizona, Oct. 11th, $1,349.82; Northern Belle, Oct. 10th, $12,015.11; California, Oct. 12, $58,053.61; Con. Virginia, Oct. 12th, $68,938.62; Leopard, Oct. 13th, $13,550.92; Northern Belle, Oct. 12th, $12,120.41, Comanche, Oct. 10th, $7,919 30; Con. Virginia, Oct. 14th, $85,755.57; Leopard, Oct. 8th, $4,576.60; Ophir, Oct. 13th, $27,673.46; Washington (Mariposa Co.), 470 ounces from 375 tons of ore; Arizona, Oct. 15th, $3,688; California, Oct. 17th, $73,210.85; Northern Belle, Oct. 15th, $16,180.11; Leopard, Oct. 17th, $12,380; Con. Virginia, Oct. 17th, $101,343 73.

Our Agent in Idaho.—Mr. B. Goodwin, an old and reliable agent of this paper, will soon visit Idaho Territory and take items of its mines and other rich resources. Circumstances beyond our control have prevented our giving full correspondence heretofore from this important portion of our mining field. We invite local correspondence from all parts of the Territory.

The Boston mill was started crushing Justice ore last Friday. Six mills are engaged grinding this ore, and it is expected that the yield for the current month will be $200,000,

AVERILL MIXED PAINT,

MANUFACTURED BY THE

CALIFORNIA PAINT COMPANY.

THIS PAINT IS MIXED READY FOR USE.

THE PUREST WHITE, AND OF ANY DESIRED SHADE OR COLOR.

It will not peel, crack nor chalk off, and will last twice as long as the best white lead, prepared in the ordinary way. Is cheaper, handsomer, more durable and elastic than the best of any other Paint.

For Sample Cards and Circulars, Address

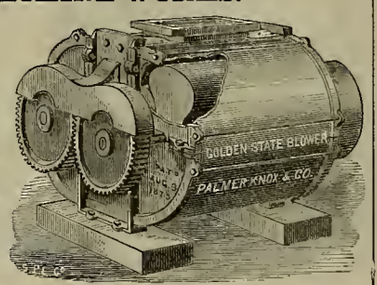
CALIFORNIA PAINT COMPANY,

115 PINE STREET, SAN FRANCISCO.

GOLDEN STATE IRON WORKS, CO-OPERATIVE,

FOUNDRY and MACHINE WORKS.

Mining —AND— Milling Machinery OUR SPECIALTY.



GOLDEN STATE SUCTION AND PRESSURE BLOWER FOR VENTILATION OF MINES. BLAST OR EXHAUST FOR FURNACES OR REDUCTION WORKS.

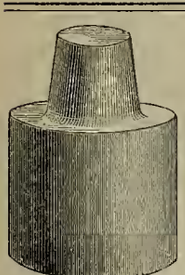
They have no superior. The casing is made in sections, so as to be easily accessible. They run easily not rapidly, and the perfect contact of wings gives a uniform and powerful blast.

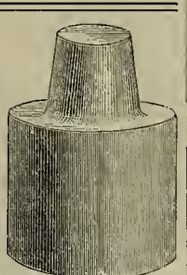
PALMER, KNOX & CO.,

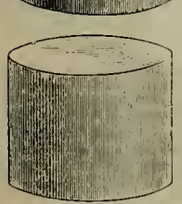
Nos. 19 to 25 FIRST STREET, San Francisco, Cal.

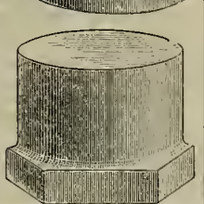
PATENTED

CAST STEEL SHOES AND DIES.









Guaranteed Cheaper than the Best Iron.

IMPORTANT NOTICE.

Reduction in Price from 16 Cents to 12 Cents Per Pound.

Owing to our largely increased business, the present low price of Iron from which our Steel is manufactured and the improved facilities for casting and forging, we take great pleasure in announcing that from and after this date we will supply our IMPROVED CAST AND FORGED STEEL SHOES AND DIES FOR QUARTZ MILLS at 12 cents per pound, delivered at San Francisco or Sacramento, instead of 16 cents, as heretofore.

We also furnish Steel Plates for Blake and other Ore Crushers, Steel Gut Gearing, etc., for Mills and Hoisting Works, Steel Pan Shoes, Battery Cams and Tappets, etc.

Address all orders, with dimensions or drawings, to

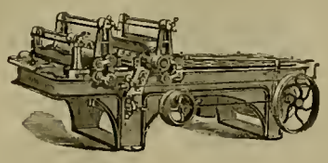
Repairing promptly attended to at the lowest possible terms.

California Planers and Matchers, and Wood Working Machinery of all Kinds

California Planer and Matcher

Is gotten up from new patterns specially for this Coast. It has Cast Steel Slotted Cylinder Head, running in patent self-oiling boxes; will plane 24 inch wide and *six inch thick*, and tongue and groove 14 inch wide. Will make rustic and stick gutters, or heavy mouldings, etc., and is the best job machine ever built. ☞We have always on hand those machines with or without under cutter head, also, a large assortment of Planing Mill Machinery.



SMITH'S PATENT POWER MORTISERS, WITH LATE IMPORTANT IMPROVEMENTS.

Mortiaer.

Smith's Celebrated Molders.

We have four sizes of these Machines always on hand—"B," "C," "D" and "E,"—to work either three or four sides. Have slotted heads and all other improvements, and may be seen in any mill on the Coast. ☞*Prices reduced* to 15 per cent. less than Eastern list. We have also, a large stock of all kinds of Planing Mill Machinery, such as Moldere, Mortisers, Tenoners, Band and Jig Saws, etc. Send for our new Illustrated Catalogue. Newspaper Fileholders.

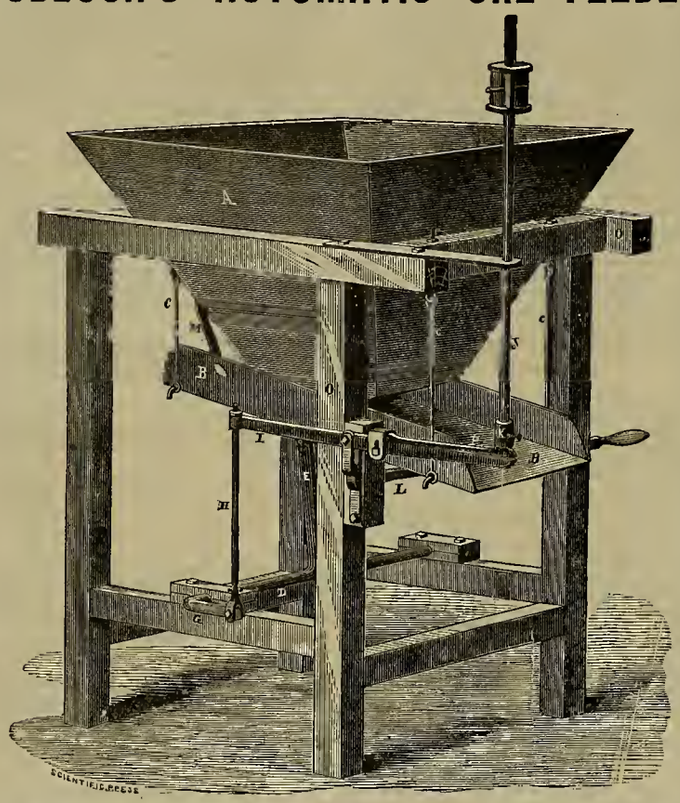
Dewey's new elastic fileholders (black walnut), size of the PRESS, *Harper's Weekly* and *Scientific American*, for 50 cts. Larger sizes, to suit any newspaper, 75 cts. By mail, postpaid, 10 cts. extra. Cash with all orders. Patent allowed. Address, DEWEY & Co., Publishers, San Francisco.

TULLOCH'S AUTOMATIC ORE FEEDER.



The TULLOCH AUTOMATIC ORE FEEDERS have been practically tested during the last year and a half in 40 mills, of from five to 80 stamps each, and have, in every case, given perfect satisfaction. The Tulloch machine is so constructed that the drop of the stamp feeds the ore in just such quantities as the stamps require. Each drop regulates the supply required for the next drop, whether it be more or less, and this is the true principle of an automatic feeder. The tray moves longitudinally, and a stationary scraper forces the material forward at each backward movement of the tray, thus insuring the perfect feeding of all classes of ore, whether it be dry or wet.

We append a few extracts from the many testimonials which we have received from mill men and practical mining men, of the effectiveness and positive action of the Tulloch Feeder. We do not depend solely upon these testimonials, as we are aware that testimonials are easily secured for almost any machine, but the high character of the parties certifying to those herewith given, will establish their value and genuineness:

Mr. Jas. G. Fair has 28 in use; says: I regard them superior to any Feeder with which I am acquainted; I consider no mill perfect without them. Mr. E. R. Burke, Sumner mine, Kern county, has 16: They never get tired; no man living can feed a battery as well; they save us in labor alone $48 a day. Mr. Green, of the Phœnix mill (12), Amador, writes: The first machine we had is working away; is as good as ever; have not spent a dime on it; in use 14 months; you need fear no competition on wet ores. Mr. W. H. Armstrong, of Consolidated Virginia mill: We are running 60 stamps with your Feeders; they give unbounded satisfaction; they have not cost the company one dollar since starting up. Mr. H. C. Bidwell, Supt. Green Mountain and Gold Stripe companies, Plumas county, writes: From the start they have done splendidly; no trouble whatever; requiring but little attention; a boy can manage them; the saving in both labor and castings is fully one-half over the old style of feeding by hand. Mr. Preston writes: I have four of your Automatic Self Feeders, and my mill men each and all say they are the best they have ever used. They are an improvement on all I have ever seen, being simple in construction, and good for either wet or dry crushing; refer to over 40 mills using them; they are guaranteed to give perfect satisfaction. Send for circulars.

F. OGDEN, 417 Market Street, S. F.

San Francisco Cordage Company.

Established 1856.

We have just added a large amount of new machinery of the latest and most improved kind, and are again prepared to fill orders for Rope of any special lengths and sizes. Constantly on hand a large stock of Manila Rope, all sizes; Tarred Manila Rope; Hay Rope; Whale Line, etc., etc.

Continued from Page 270.

Arizona.

LOCAL NOTES.—Arizona *Citizen*, Oct. 14: On the 10th Joe Herring took $162 out of his claim, at the Santa Rita placers, from one pan of dirt; hut one piece of the gold was worth $150. The Trench mine and smelting works are now employing 60 men, and smelting goes on night and day. Mr. Gardner, who came in on Thursday, says they are now smelting ore which yields all the way from 50 to 750 ounces of silver to the ton. Mr. Gardner says the owners of the Santa Rica mine brought one ton of their ore to the Trench works, smelted it and obtained 151 ounces of silver; also that D. T. Hershaw and partner recently discovered a vein of silver ore near the Trench, took one ton of the ore and smelted it at the Trench works, and got 92½ ounces of silver. Everything in the neighborhood of the Trench looks encouraging.

Idaho.

THE MINES.—Idaho *Avalanche*, Oct. 14: The Poorman continues to yield a splendid quality of rock, a considerable quantity of which is now being crushed at the Ellmore mill. The indications are very favorable for a promising return. The prospects of the Empire mine are improving daily. From a recent test of the rock it was ascertained that the pile about to he crushed will make such an average yield as will fully justify the continuance of operations in the mine for the coming winter. A bar of bullion from the Potosi crushing at the Ellmore mill, weighing 93 pounds, was melted by A. L. Simondi recently. This is the first treasure that has been taken from the Potosi for over six years. The value of the brick was $2,855.46, of which about one-third is gold and two-thirds silver. The rock averages about $32 to the ton, which, though not quite up to the expectations of the owners, will pay handsomely. Our Wagontown correspondent, under date of 12th instant, writes: The new quartz mill is rapidly approaching completion. The building is enclosed and roofed over, the engine bed in place and the boilers ready to he placed in position, so that there is nothing to hinder its being placed in position by the first proximo. The Last Chance mine is running a full crew of men and is turning out a considerable quantity of good ore.

Utah.

ALTA MINES.—Cor. Salt Lake *Tribune*, Oct. 10: The tramway is doing a big business in the freight line, as our miners and merchants are laying in their winter supplies. The frame for the tramway sheds has nearly reached this place, and all the mills here and along the line of the road are busy sawing lumber to cover them. A large body of rich ore has been struck in the Crown Prince and Frederic mine, now under lease to Messrs. Brough, Tucker and Johnson. The company are preparing to drive their tunnel ahead with steam drills another season. The Flagstaff mine is the mainstay of this camp. It works a large force of men, keeps wages at the highest notches, and the result is they are making the largest shipments of ore of any mine in camp. In fact, they are shipping nearly as much as all the mines together. They hire the most skilful laborers and are willing to pay for them. What a contrast to two other mines in camp, once leading mines, which have adopted the plan of cutting down wages to the lowest figure for which a laboring man is willing to wear away a day of his life. As a natural consequence, the work is poorly done, the ore badly sorted from lack of experienced labor, and carelessness of cheap laborers. The mines do not pay, the forces are cut down and now they are little more than a cipher to what they "might have been."

New Incorporations.

The following companies have filed certificates of incorporation in the County Clerk's office at San Francisco:

WEST JUSTICE M. Co.—Oct. 11. Location: Nevada. Trustees—M. White, J. C. Ballinger, A. G Kinsey, A. F. Main and E. J. Moore. Capital stock, $4,000,000.

DONALD G. & S. M. Co.—Oct. 13. Location: Nevada. Directors—C. B. Jillson, F. H. Fanley, Daniel Hanlon, D. H. Percy and John Ward. Capital stock, $10,000,000, divided into 100,000 shares.

COOK ANN GRAY G. & S. M. Co.—Oct. 13. Object: To miue and mill ores from the Midas and Flora Temple mines, Lyon and Storey counties, Nevada. Directors—S. Heydenfeldt, J. G. Riley, D. B. Francis, J. Phelan and W. B. Murdoch. Capital stock, $10,000 000.

LORD & ROBINSON G. & S. M. Co.—Oct. 13. Object: To mine and mill ores from the Cook and Gray and Little Giant mines, Storey county, Nevada. Directors—S. Heydenfeldt, J. G. Riley, D. B. Francis, J. Phelan and W. B. Murdoch. Capital stock, $15,000,000.

LOYAL G. & S. M. Co.—Oct. 13. Location: Washoe. Directors—B. B. Taylor, Frank L Kreider, R. C. Singer, Geo. H. Bradshaw and W. J. Pilcher. Capital stock, $10,000,000.

CALIFORNIA CRYSTAL OIL CO.—Oct. 14: Directors—J. B. Ford, Hiram Tubbs, B. Wellman, T. M. Dawson, W. H. Murray, W. O. Quinby and A. Rogers. Capital stock, $100,000.

WASHOE WATER AND GRAVEL CO.—Oct. 14. Directors—C. W. Carter, W. H. Duryea, C. H. Light, D. B. Coffin and J. H. Wilson. Capital stock, $2,500,000.

GEN. ROBERT ALLEN S. M. Co.—Oct. 16. Location: California. Directors—Robert Allen, J. D. Wilson, W. H. Duryea, J. Y. Wilson and Samuel Locke. Capital stock, $6,000,000.

OCCIDENT M. Co.—Oct. 16. Location: California. Directors—A. Erickson, J. E Englestrom, Robert Sloan, C. E. Joy and N. Leigh. Capital stock, $10,000,000.

EQUATOR G. & S. M. Co.—Oct. 17. Location: Nevada. Directors—Benjamin Lake, E B. Clement, James H. Wilson, E. E. Potter and N. Curry. Capital stock, $10,000,000.

PLUTUS G. & S. M. Co.—Oct. 17. Directors—A. Peck, John Brunner, M. Freudenberg, William Jay Smith and H. A. M. Thee. Capital stock, $12,500,000.

Meetings and Elections.

EUREKA CON. M. Co.—Oct. 16. Trustees—George S. Dodge (President), S. Heydenfeldt (Vice-President), F. Zeile (Treasurer), Frank Locan and John W. Shaw. W. W. Traylor, Secretary and H. Donnelly, Superintendent.

EXCHEQUER M. Co.—Oct. 16. Trustees—S. Heydenfeldt (President), J. T. Hill, Henry Von Bargen, W. A. Schultz and Geo Schultz (Vice-President). J. S. Kennedy was elected Secretary and E. A. Schultz, Superintendent.

SAN FRANCISCO AND NORTH PACIFIC RAILROAD CO.—Oct. 16. Trustees—Peter Donahue, Michael Reese, T. J. Bergen, Edward Martin and F. H. Gerdes. Peter Donahue was chosen President; Michael Reese, Vice-President; E. Martin, Treasurer; P. Dougherty, Sec'y.

SOUTH CHARIOT M. Co.—Directors—Geo. L. Perine, E. Kenely, F. A. Roe, J. Naphtaly and W. H. McClintock.

NORTH CARSON M. Co.—Trustees—J. M. Gitchell, W. O. M. Berry, D. L. McDonald, N. D. Chamberlain, J. I. Ayres. Mr. Ayres was elected President, D. L. McDonald, Vice-President; W. A. Van Bokkelen, Secretary; A. S. Gould, Superintendent.

MINT M. Co—Mr. John Landers has been elected a Trustee to fill the vacancy caused by the resignation of J. K. S. Latham.

THE MCCRACKEN CONS. M. Co. have re-elected their old officers.

WOODWARD'S GARDENS embraces an Aquarium, Museum, Art Gallery, Conservatories, Tropical Houses, Menagerie, Seal Ponds and Skating Rink.

Remarks on Quicksilver.

[Written for the PRESS by SAMUEL PURNELL.—No. 2.]

Chemistry of Mercury.

The chemistry of mercury is simple. It is a white metel, flnid at temperatures between 40 deg. and 675 dsg. F., at which latter point it becomes vapor. The proper ore of mercury is cinnahar, consisting, when pure, of sulphur, 13.79, and of qnicksilver, 86.21 per cent. The density of mercury vapor, referred to sir as nnity, is 6.7. Mercury is slightly soluble in boiling water. It amalgamates with nearly all metals, except iron.

No operation in modern metallurgy is so simple as the extraction of quicksilver from cinnebar. The ore is heated, with or without a flnx, in a close chamber, the metal is snblimed, and condensed in a cold chamber. There are two processes—one, by distillation with flnx; the other, hy rossting with air without flux. The latter is now alone nsed with profit on low grade ores, and is practically universal. In the process of distillation with flux in retorts the powdered ore is mixed with hydrate of lime and heated to a red heat; the snlphur combines with the lime, forming sulphide of lime (with some sulphate), and the qnicksilver vapor passes off to a condenser.

Sulphur combines with most other snbstances more readily then with mercury, consequently mercurial compounds are readily decomposed. Sulphur has a very decided affinity for oxygen. Therefore, when cinnshar is heated with free access of air the snlphur is oxidized, uniting with the oxygen to form sulphurous acid, according to the equation $Hg\ S + O_2 = S\ O_2 + Hg$, and metallic mercury is left behind, which sublimes nearly pure. The residue is mostly silica, clay, lime, iron, etc. Cinnahar is itself volatile, and may he distilled, nnaltered, at a red heat. In the condeneere there ie also deposited along with the mercury a peculiar tarry snbetance called "soot." It is composed of flonr of mercnry, nndecomposed cinnabar, soot from the fuel, ore dust, and sometimes a little calomel. Thie eoot ie reworked for the mercury it contains. The sulphide will fuse if too much heat is applied at the beginning of the roasting.

Quicksilver Furnaces.

The most ancient manner of working cinnahar with which we are acqueinted, is the Aludel furnace, of Peruvian origin, hnt which has long been superseded by better forms. Its description may be found in all the metallnrgical hooks. The modern form of continnous roasting furnace ie that of a square or round stack, receiving the ore at the top, discherging the epent meterial at the bottom by meens of a movable grate, edmitting cold eir below, and having a fire-place on one or more sides from which the flemes are drawn across the column of ore, thus heating it, eubliming the quicksilver and taking off the vapors neer the top of the column on their way to the condenser. These furneces are made of various shapes and sizes, hut the principle of ell of them ie the same. Such furnaces cen work only large pieces of ore, as the fine earthy orea, or "tierras," would speedily choke it. At the Redington mine a new continuous furnace for fine oree is working successfully. It consiste, essentielly, of a reverberatory with an inclined hearth, with terraces to prevent the ore from falling towards the fire too rapidly, with projectione on the roof to deflect the flamee more strongly on the hearth, and ie provided with a speciel feeding apparatus. It roasts a class of oree which previously conld not be worked without being made into bricks celled "adohes." Until a few years ago there were no continuous quicksilver furnaces; the old process having heen to charge them with ore, increase the fire for three or fonr daye till all was bright red, air heing freely admitted all the time; in a week the dietilletion was completed, the furnace was cloeed, allowed to cool, and the spent ore wae removed. As may he imagined, ench a procees was costly, elow and nnhealthful. The principal modern forme of continnone furnaces are the Haehner, used in Europe, and the Knox & Oshorne, nsed in California, but hoth are based on the eame general principles. At New Almaden a Haehner continuoue furnace ia used, patterned efter that of Idria. At the Redington mine the furnacee are those of the Knox & Oshorne petent, and the fine ore style ahove referred to. The Knox & Oeborne furnace is of hrick, and has a eingle fire drawing straight across the colnmn of ore. The Idria furnace hae three fire placee, drawing through three-fonrths of the colnmn. The walls are thin linings of fire brick, surrounded hy an air epace, then another hrick wall enclosed in iron. The charging apperatus is of the hell and hopper style, modeled after tbat of the hot-blaet iron furnace. In these shaft furnaces it hee been found impracticable to mix the ore end fnel together, aa ie usual in burning limestone, so separate fire places are always provided. At the Buckeye mine, in Colusa connty, a Knox & Oshorne furnace was erected at a cost of $11,000. From ores moderately rich the yield from the condenser wae from 80 to 100 flasks a month. In this furnace it was claimed that the ore wae kept red-hot for 60 hours, and that perfect redncticn conld not take place in less time. The latter claim is no doubt an error, there being good reason to suppose that so little as one-tenth that time would answer in a continuous furnace of different pattern, working fine ores, and having the heet at all times under complete control. A disadvantage to the usual shsft furnace is the fact thst the heat is under very little control; the furnace gets entirely too hot, consnming more fuel then is neceasery, and expanding the mercnrial vapors to so high a degree that it ia elmost impossible to condense them. Unfortunately for the shaft furnaces, the bnlk of the ores rsised from cinnabar mines are fine, and until the introduction of the Livermore fine ore furnece at the Redington mine these ores hed been nesrly always handled without profit and mostly at a loss. In 1873 more then one-half the ores worked at New Almaden were these "tierras," yielding two per cent, and which had to he mixed with cley into bricks and dried before being charged into the shaft furnace.

General News Items.

THE British government has apent abont £17,000,000 in irrigstion works in India.

A RENEWAL of the feud hetween the Chinese companies in Virginie, Nevade, is expected.

THE rumor of the Czar's contemplated abdication is officially denied.

THE Baldwin hotel on Msrket street will probahly be opened to guests in about six weeks.

EUROPEAN affairs are fast approeching a crisia, and it looks now as if war wonld shortly commence.

THE first snow of the season fell at New York, Boston, Washington, etc., on the 15th inst. The first good rain fell in San Francisco last Sundey night.

THE Englieh middle claeses are going through e time of greet financial depression, one which tenda to render the times there almost as bad ae in the Eestern States.

DURING the 24 hours ending at 1.30 Wednesday afternoon, .91 of an inch of rain fell, meking the total fall for the month to date 1.45 inches, and for the season 1.85 inches.

FIVE cadets have been dismissed from the Naval Academy for refusing to tell who hazed the "plebes." The expelled stndents refneed to teetify to save other etudents from heing expelled for hazing, for which there is the additionel penalty of heing cashiered.

IN this city the total number of emell-pox casea since the epidemic hegan, nearly five months ago, is 964; deaths, 265. The type continnes to he melignant, especially those nnprotected hy veccination, although fewer cases are reported than last month. Very many of the new casee are persone from ahroad and the interior of the State.

THE new iron steemship *City of Chester*, hnilt hy John Roach & Sons, to run hetween San Francisco and Portlend, Oregon, mede a satisfactory triel trip up the Sonnd on Sunday, paseing through Hel Gate. Thie ie the firet ocean steamer that hes made the ventnre since the explosion. Among the gneste were Captain Ottendorf and Mr. Henderson of San Francisco.

THE *Tribune's* Washington speoial says: The Chief of Engineers has decided upon the distribntion of the remaining portion of the river and harhor appropriation. While the details are not yet published, the eelection of the work to he prosecnted was determined in each case aolely by its commercial importence, aud generally those items which were introduced into the bill as the resnlt of log rolling by members of each political party, have been ignored.

THE agent of the New York Asaociated Prese received a dispatch signed hy Dr. Cherlee T. Deems, announcing the death of Commodore Vanderhilt, at 10 20 A. M. After thie news hed heen telegrephed all over the United States, it was ascertsined that the dispatch waa a forgery, and that the Commodore is hetter than he hae been for many monthe. The stock exchange is endeavoring to ascertain the anthor of this and other hogus telegrams, with a view to securing his punishment.

THE Southern Cross and Polar Star claims have shut down, and it is stated on good anthority that washing therein will not be resumed for at leaet one year and perhaps longer. The proprietors assign ae a reason that wages are so high there that they cannot be worked with satisfactory profit.

THE work on the Summit coal mine, near Livermore, is progressing finely. The coal is improving as the workmen progress.

PATENTS & INVENTIONS.

A Weekly List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

FOR WEEK ENDING OCTOBER 10TH, 1876.

GRATES FOR LIME KILNS.—William Gwynn, Sacramento, Cal.

SHOES.—Cheang Hne, S. F.

BOTTLE COVERING MACHINES.—Alois L. Becker and Frederick W. Volkman, S. F.

*AIR CHAMBERS FOR FORCING WATER FOR OPERATING ELEVATORS, ETC.—Philip Hinkle, S F.

WOOD PAVEMENTS.—Henry F. Williams, S. F.

RE-ISSUES.

*IMPROVEMENT IN UNDERGROUND TUBES FOR PROPULSION OF CARS, PATENTED JUNE 20TH, 1876.—Andrew S. Hallidie, S. F.

*COAL SCREENS AND GRATES.—Martin R. Roberts, S. F.

*The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of mention:

WATCH CHAIN.—John J. Rohrhach, San Francisco. This invention relates to certain improvements in the construction of link watch chains, and it consists in a novel formation of the links, which are united so that when either of two opposite sides are presented to view it will give the appearance of a heevy ber-link gold chain, hut when turned so that the other sides are exhibited the appearance of a quartz or other ornamental setting will be given. The invention also relates to a novel construction of the link and an ornamental hand, so that the link mey have an opening at the side for the convenient introdnction of the small joining links.

OPERATING ELEVATOR VALVES.—Philip Hinkle, San Francisco. Thie invention relatee to a novel device which may he employed to operate elevator and other velves when it is necessary to open one and close another valve at the seme time. It consists of a slotted segment formed on different curves, and the steme of the valves are moved hy this slot. The outer edge of the segment is provided with teeth, and a pinion mounted upon the axle of an operating rope pulley seema to turn the segment in either direction as the case may require.

THE Duke of Westminster, a wealthy English nobleman, has fallen into the hebit of admitting the workingmen on Sundeye to the picture galleries and mnsenms of his magnificent residence. He eenda tickete to all the workingmen's clubs and tradee nniona, which distribute them as they please.

ARRANGEMENTS have been made to take out only 1,100 tone of ore daily from the Califernia and Conaolidated Virginia mines, thus giving a combined monthly yield of $3,000,000, which it is eeid can be increased to $4,000,000 if found desirable, hut the idea is not to overstock the silver market.

THE sheft of the El Dorado coal mine, Nevada, ie down 530 feet. The last 30 feet has been passing through fine clay containing streaks of carbon. This is an immense body of clay and the indications are thet a stratnm of fine coal lies under it.

CONTRACT work for the completion of "Lick avenue," the great highway from San Jose to Mount Hemilton, hae been reenmed in earnest, and is to he done by the 1st of Janusry, when bnilding is to hegin at the summit on the site selected for the Observatory.

THE California mill consumes monthly 30,000 pounds of qnicksilver that never finds ite way heck again. The Consolideted Virginie mill will use np abont ae much more, and the two will certainly make away with $1,000 worth a day.

W. H. ARMSTRONG, who wae Superintendent of the Consolidated Virginia mill before the fire, hae been appointed Superintendent of the new mill just finished. Mr. Armstrong is aleo Superintendent of the California mill.

THERE is still a good heed of water in the Carson river, end all the mille are running on fnll time. with the exception of thoee already mentioned ae having shut down for repairs.

THE Nevada qnartz mill at the Centennia hae heen awarded a premium.

VICTORIA, B. C., is full of Cassier miners, selling duet and buying ontfits.

A GOOD domestic snlphur hath' can he instantly prepared by taking a cake of GLENN'S SULPHUR SOAP into the hath tnh. Such an expedient will, to use a slang phrase, "knock the spots off" any victim of cntaneous blemishes. Sold everywhere.

Much Obliged, Etc.

PORTLAND, OGN., June 26th, 1875.

DEWEY & Co., Patent Solicitors, S. F.—*Gents:* I am much obliged to you for courtesy shown me, and am well pleased with the manner in which you have done my business, and assure you, will cheerfully recommend you to my acquaintances needing such services. Hope to have a case again before long, of my own. I have been an inventor all my life, but let others reap the benefit, or bad work stolen from me. Please have the extra copies of my patent, etc., mailed to me direct, and oblige Yours truly, J. H. WOODNUM.

Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

Office Cascade Blue Gravel Mining

Machinery.

The Ingersoll Rock-Drill

Is Extensively Used in the East and

TAKES THE PLACE OF ALL OTHERS,

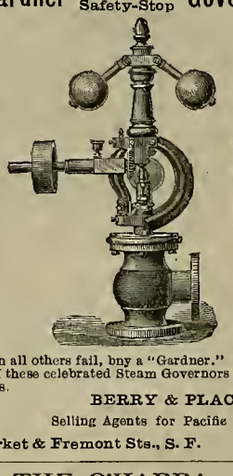
Wherever introdnced, because it can be run with less power, labor and repairs, and do more work than any other Drill in the market. It has but few parts, is easily handled, being light, and HAS AUTOMATIC FEED, which saves labor. WE ASK FOR TRIAL AGAINST ANY COMPETITOR. For particular information regarding Drills or Air Compressors, send for circular to

J. B. REYNOLDS,

426 California Street

The Gardner Automatic Safety-Stop Governor.

MORE THAN TEN THOUSAND NOW IN USE. EVERY ONE WARRANTED.



SEND FOR DESCRIPTIVE CIRCULAR AND PRICE LIST.

☞ When all others fail, buy a "Gardner." We have all sizes of these celebrated Steam Governors on hand at all times.

BERRY & PLACE,

Selling Agents for Pacific States,

Cor. Market & Fremont Sts., S. F.

THE O'HARRA

CHLORIDIZING FURNACE.

Guaranteed to Chloridize from 85 to 95 per cent. of any gold or silver ores that are not more profitable for smelting. Will also desulphurize ores and put them in proper shape for working in cupola furnaces.

Cost of Roasting and Chloridizing by this Process:

Two cords of wood at $6	$12.00
Two firemen at $4	8.00
1500 lbs of salt at 1½c	22.50
Wear of shoes and power	1.50
Cost for 15 tons	$44.00
Cost for one ton	2.93⅓

In a furnace of three or four times this capacity the cost is decreased by 20 per cent.

The furnace is now working successfully at the Poe Consolidated Co.'s mines, in the Peavine District. For further information, apply to

D. J. O'HARRA,

Reno, Nevada.

Diamond Drill Co.

The undersigned, owners of LESCHOT'S PATENT for DIAMOND-POINTED DRILLS, now brought to the highest state of perfection, are prepared to fill orders for the IMPROVED PROSPECTING and TUNNELING DRILLS, with or without power, at short notice, and at redneed prices. Abundant testimony furnished of the great economy and successful working of numerous machines in operation in the quartz and gravel mines on this coast. Circnlars forwarded, and full information given upon application.

A. J. SEVERANCE & CO.

Office, No. 426 California street, Room 1.

BLACK DIAMOND FILE WORKS.

SAWS! SAWS! SAWS!

EMERSON, FORD & CO.'S

Celebrated Solid Tooth & Inserted Tooth

CIRCULAR SAWS;

—ALSO—

Mulay, Cross-Cut and Other Saws,

FOR SALE AT

No. 222 JACKSON STREET, San Francisco

During my absence in Oregon, and till further notice all orders for the above Saws or Saw Teeth addressed to D. L. EMERSON, No. 1 Spear street, will receive prompt attention by my agent, Wm. L. Jones.

We have a large number of Saw Teeth and Saw Bits—about 15,000—now on hand, and are receiving new invoices to supply the demand,

D. L. EMERSON.

PAUL'S DRY PROCESS.

I am now prepared to test gold and silver milling ores in any quantity from FIVE POUNDS to FIFTY TONS, and assert my ability to prove, by machinery NOW UP, and open to public inspection, and by practical testing of its merits, that I can increase the yield of gold mills, working wet batteries and copper plates, from FIFTY to ONE HUNDRED PER CENT., and on silver ores a much larger percentage than by pan amalgamation, and at less expense than any known method of working quartz well; and from some "gold" ores of California can extract more silver extra with the gold, which is now lost, than all the expenses of mining and milling. Having had 25 years' practical experience in milling gold and silver ores, I presume to know whereof I speak, and AM PREPARED TO PROVE ALL I ASSERT. These mills, for simplicity, cheapness, practicability and perfection in working, challenge the skill of the age to surpass. Quartz miners who desire to investigate and have their ore tested, are invited to a critical examination of the machinery and process, and can receive permits for examination, particulars and pamphlets explaining process by calling at my office. ALMARIN B. PAUL.

Room 20, Safe Deposit Building, 328 Montgomery St

LATEST IMPROVEMENT.

Excelsior Scroll Saw.

Double Treadle, including one dozen Saws, 30 inimitable Fret Saw ing Patterns and Prepared Wood to the value of $4. A new device for tightening Saw, Power Drilling attachment, Wrench, Oil Cup and Driver. Speed, 800 strokes per minute. Saws 1½ in. blade. Price, complete, cased and delivered on board cars or at Express office, $12.

SMALL STEAM ENGINES,

With copper Boiler, to drive light Lathes, Scroll Saws, etc. 100 Scroll Work Designs, free on receipt of Stamp.

Saw only, without attachments, $9

GEO. PARR, Buffalo, N. Y.

San Francisco Pioneer Screen Works,

J. W QUICK, MANUFACTURER,

32 Fremont Street, San Francisco.

SCREENS

Several first premiums received for quartz mill Screens, and perforated sheet metals of every description. I would call special attention to my SLOT CUT and SLOT PUNCHED SCREENS, which are attracting much attention and giving universal satisfaction. This is the only establishment on the coast devoted exclusively to the manufacture of Screens. Mill owners using battery Screens extensively can contract for large supplies at favorable rates. Orders solicited and promptly attended to.

ERICH G. GAERTNER,

MINING ENGINEER.

All classes of mining properties reported on, consultations had on reduction of ores of all descriptions, plans for furnaces and reduction works furnished, and the construction of them superintended. Ore tests made at the office,

309 California street, Rooms 8 and 9.

Mining Superintendent

Of Twenty Years' Experience in opening and working Mines, building mills and working gold and silver ores, specially those termed *Rebellious*, is open to engagement. Address, E. B. SMITH, this office.

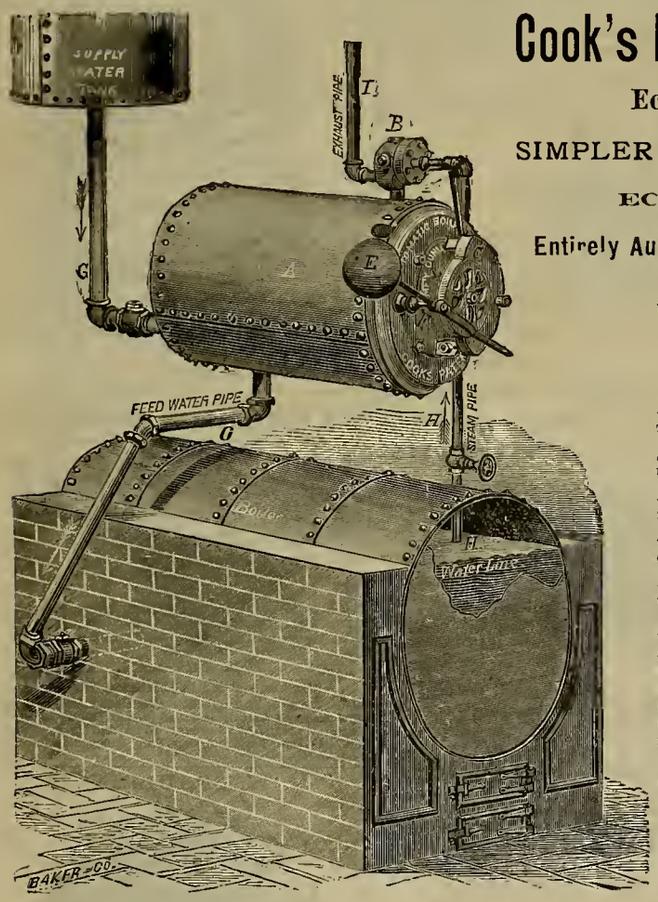
Catalogueе and Estimatee given on application.



Cook's Patent Automatic Boiler Feeder & Regulator.

Economy in Operation. Absolute Safety from Explosion.

SIMPLER THAN A PUMP, AS IT REQUIRES NO ATTENTION.

ECONOMY IN FUEL.

Entirely Automatic, Reliable & Durable.

Cook's Automatic Boiler Feeders

WERE AWARDED THE HIGHEST PREMIOM OVER ALL MACHINES EXHIBITED AS BOILER FEEDERS AT THE CINCINNATI EXPOSITION AND THE ST. LOUIS FAIR.

The cuts show the operation of the Feeder. It was described in detail in the MINING AND SCIENTIFIC PRESS of May 20, 1876.

This Feeder will discharge from 40 to 200 gallons of water at one movement, where a pump would require hundreds of strokes to do the same work.

The water is kept exactly at the proper line, whether running fast or slow, without attention from the engineer.

Feeders, Heaters and Regulators Combined are made on this principle. Simple and economical.

The control of feeding water to the boiler is taken out of the hands of the engineer and left to unerring natural laws.

Theee Machines are now introduced on thie coast for the first time, although they are exteneively used in the Eastern States. They eupply the boilers with great regularity, and keep the water at exactly the same level. As a protection against exploeion they are simply perfect, leaving nothing to be desired.

ONE OF THESE FEEDERS OAN BE SEEN IN OPERATION AT THE PACIFIO IRON WORKS.

Address.

DEWEY & CO.

American & Foreign Patent Agents

OFFICE, 224 SANSOME STREET, S. F.

The best, speediest, and surest method for yon to obtain patents, file caveats, or transact sny other important business with the Patent Office at Washington, or with foreign conntries, is through the agency of DEWEY & CO., PUBLISHERS OF THE MINING AND SCIENTIFIC PRESS, SAN FRANCISCO, an able, responsible, and long-established firm, and the principal agents on this side of the continent. They refer to the thousands of inventors who have patronized them, and to all prominent business men of the Pacific Coast, who are more or less familiar with their repntation as straightforward journalists and patent solicitors and counsellors.

Our intimate knowledge of the various inventions of this coast, and long practice in patent bnsiness, enable ns to abundantly satisfy our patrons; and our snccess and bnsiness are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introdnction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secnre, with the assistance of co-operative agents, claims in all foreign conntries which grant Patents, including Great Britain, France, Belgium, Prnssia, Anstria, Baden, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brszil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemberg, New Zealand, New Sonth Wales, Queensland, Tasmania, Brazil, New Grenada, Chile, Argentioe Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in Enropean conntries, but the drawiugs and specifications should be prepared with thoronghness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our sohedule prices for obtaining foreign patents, in all cases, will always be as low, and in some instaoces lower, than those of any other responsible agency.

We *can and do* get foreign patents for inventors in the Pacifio States from two to six months (according to the location of the country) SOONER than any other agents.

The principal portion of the patent business of this coast has been done, and is still being done, throngh our agency. We are familiar with, and have full records, of all former cases, and can more correctly judge of the value and patentability of inventions discovered here than any other agents.

Sitnated so remote from the seat of goverooment, delays are even more dangerons to the inventors of the Pacific Coast than to applicants in the Eastern States. Valnable patents may be lost by extra time consumed in trans mitting specifioations from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secreoy in all confidential matters, and applicants for patents can rest assured that their oommnnicatioos and bnsiness transactions will be held strictly confidential by ns. Circulars free.

Home Counsel.

Onr long experience in obtaining patents for Inventors on this Coast has familiarized ns with the character of most of the inventions already patented; hence we are freqnently able to save our patrons the oost of a frnitless application by pointing them to the same thing already covered by a pstent. We are always free to advise applicants of aoy knowledge we have of previous applicants which will interfere with their obtaining a patent.

We invite the aconaintance of all parties connected with inveotions aod patent right bnsiness, believing that the mntual conference of legiiimate bnsiness and professional men is mutnal gain. Parties in doubt in regard to their rights as assignees of patents or pnrchasers of patented articles, can often receive advice of importance to them from a short call at onr office.

Remittances of money, made by individnal inventors to the Government, sometimes miscarry, and it hss repeatedly happened that applicants have not only lost their money but their inventions also, from this cause and conseqnent delay. We hold onrselves responsible for all fees entrusted to onr agency.

Engravings.

We have snperior artists in our own office, and all facilities for producing fine and satisfactory illnstrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable nse.

DEWEY & CO.,

Scientific and Practical Books on Mining, Metallurgy, Etc.

Published or issued, wholesale and retail, by DEWEY & CO., MINING AND SCIENTIFIC PRESS Office, S. F.

BY GUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST.

Roasting of Gold and Silver Ores, and the Extraction of their Respective Metals without Quicksilver. 1870.

This rare book on the treatment of gold and silver ores without quioksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus.

It is a work of great merit, by an author whose putation is unsurpassed in his specialty.

Price $2,50 coin, or $3 currency, postage free.

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequaled by any other published, embracing the subjects treated. Its authority is highly steemed and regarded by its readers; containing, as it ocs, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot he found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE REDUCED TO $5.

The Large Circulation of the MINING AND SCIENTIFIC PRESS extends throughout the mining districts of California, Nevada, Utah, Colorado, Arizona, Idaho, Montana, British Colnmbia and to other parts of North and South America. Established in 1860, it has long been the leading Mining Jonrnal of the Continent, its varied and reliable contents giving it a character popnlar with both its reading and advertising patrons.

Superior Photographs.

To be sure of a good picture, you have only to patronize G. D. Morse's Palace of Art, at No. 417 Montgomery street, S. F. The publishers of this journal have patronized Mr. Morse for many years, and do not hesitate to say that his pictures are not excelled by any we have seen produced in this or any other country. No one can ask for a better man to patronize than Mr. Morse. He is affable and respectful to all.

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO., Patent Solicitors.

SAN FRANCISCO, SATURDAY, OCTOBER 28, 1876.

VOLUME XXXIII. Number 18.

Items of Interest from the Mines.

We give below items of interest from prominent mines, most of which are collated from letters of the respective superintendents on file at the offices in this city. Considerable of this news is later then that procured from the interior journals:

The stopes from the upraise in the Cosmopolitan are turning out finely. The mill is crushing about 20 tons per day.

At the Lady Washington they are overhauling the pumping machinery in anticipation of an increased flow of water.

The Wells-Fargo company expect by the 1st of November to heve their new works and machinery all ready.

In the Justice the 1000-foot level is freed of water, and work resumed in southeast drift, which will he pushed vigorously ahead on a direct course until msin vein is discovered. Northeast cross-cut, same level, operations will immediately he resumed until the msin ore producing vein is discovered, which from the action of the water, is close; the ore producing stopes throughout 400, 500, 600 and 700-foot levels are developing well and continue to furnish their regular uniform grade ore from 165 to 170 tons daily, constantly supplying the numerous mills engaged in milling company's ore.

The stopes in the Leopard are all yielding a full supply of ore.

The south level of the Mansfield continues to produce splendid ore.

A dividend of 20 cents per share has been declared by the Comanche mill and mining company. This is the fourth dividend of the corporation, each dividend aggregating $12,500.

The ventilation in the lower levels of the Alpha and Consolidated Imperial mines continues to improve.

The air in the 500-foot level of the Leopard is so bad that work had to he stopped to put in air pipes.

Operations at the Chollar for week ending October 21st were as follows: Nnmber tons of ore extracted, 610 tons 1,600 pounds; number tons forwarded to mills, 558½; average assay value of ore mined, $32.50 per ton. The main incline has been snnk 16 feet; pump has worked 19¼ hours. No change in ore producing portions of mine; ore shipped on 20th, 97½ tons.

A large body of ore has been struck in the Consolidated Poe mine, assaying $180 to the ton.

A new 13-inch pump has been put in below the 650-foot station of the Silver Hill mine.

A new shaft has heen started in the Steptoe Consolidsted mine, the old one being in the wrong place.

Another pump has been put in below the 1800-foot level of Hale & Norcross.

A letter of the 22d from the snperintendent of the Herald mine says: We struck very fine ore again in the face of the drift 40 feet north of the incline, having the appearance of being a good body of it. We are through the break; the ore is full of sulphurets and chlorides—very high grade.

Work will he resumed on the 1700-foot level of the Best & Belcher as soon as the incline of the Gould & Cnrry mine is repaired, which will give better ventilation.

The Consolidated Virginia is turning out about 400 tons of ore per day; the various ore breests improving, particularly those on the 1400 and 1500-foot levels. The superintendent says: On the 1700-foot level the heat greatly hinders and interferes with our progress. We are still working in the face of the drift and soon expect to be through this hard belt of rock. We are putting in additional blowers to aid ventilation, and Burleigh drills, with which we expect to meke good headwey in connection with some of the deep winzes to secure ventilation and proepect this level with vigor. At the C. & C. everything is progressing favorably. The drift on the 1650-foot level is being extended as fast ae possible. We are now 47 feet from the shaft, and with the assistance of drills and the help of enginee placed therein yesterday will make rapid headway. The Virginia & Truckee eide treck is fast approaching completion. The timbere for the new ore house are framed. We expect all of tbis work to he completed in about two weeks.

At the Belcher they are olearing ont the main incline in order to resume working.

At the California the work of repairs on the drifts upon the 1300 and 1400-foot levels is being continued. The ore hreasts are all looking well and yielding the desired quantity of good ore.

At the Jefferson connection has been made between the winze from the 400-foot level and the main south drift 600-foot level, giving good eir throughout the mine.

Work hes again been commenced on the 1700-foot level of the Gould & Curry.

The average of ores worked in the Msnhattan last week was $169.

The shaft of the Mint is now down 1274 feet.

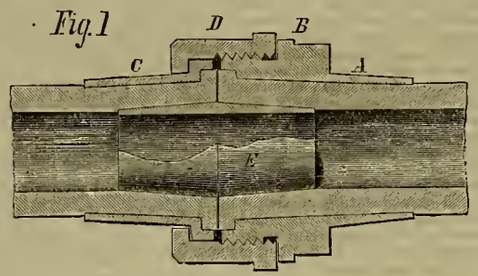
The ore body in the 400-foot level mein northeast sill floor of the Justice is fully 16 feet wide, aseeying $70 per ton. The superintendent says he has discovered and is developing the downward continuation of this same development on 600 foot level, where it is equally as rich and well-defined as on the former level; therefore the 400-foot level development overlape the west body of ore to the east. The mille are daily furnished with 190 tons of ore.

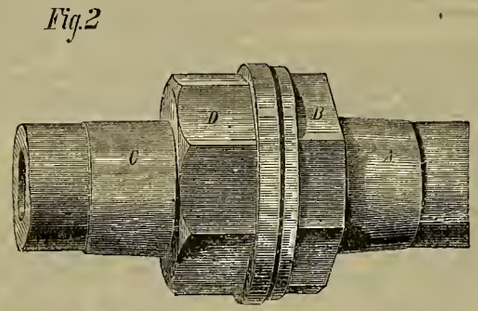
In the Baltimore Conolideted cross-cut No. 2, on the 1050 foot level, ore of a very promising character is being found.

The incline engine of the Consolideted Imperiel wes started up last Sunday.

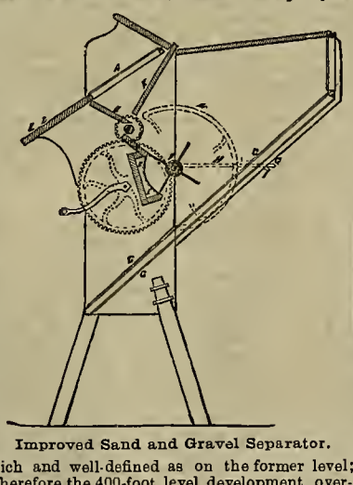
Sand and Gravel Separator.

We illustrate on this page a simple machine for screening sand and separating gravel, overcoming the slow and tedious process now in use. It will screen sand wet or dry when it can be screened in no other way. It separates the gravel entirely from the sand and deposits the roofing gravel and coarse gravel for walks, etc., in seperate places from the sand, thus saving the necessity of a second screening when roofing gravel is needed. It can be worked by one man to throw the sand and a boy to turn the crank.





THE LELAND PATENT COUPLING.



Improved Sand and Gravel Separator.

In the engraving, *A* is a coarse screen where the sand is thrown in, and which keeps large pieces from passing into the machine. The sand passes down to the feeder, *B*, which carries it down to the cylinder, *F*, which is made with four rows of pins, and which revolves with velocity, spreading and separating the sand and gravel and throwing it against the screens, *G*, *G*, which being two screens, one over the other, the roofing gravel and sand passes through the upper screen (which is made half inch mesh or any other size needed), to the lower, which is six meshes to the inch or any eize required. The roofing gravel passes down between the legs, which are enclosed, and the sand through the fine screen The coarse gravel passes down in front of the machine. *H* is a rapper or heater which strikes eight times with every revolution of the crank, against the under part of the screens, and loosens any sand that may stick to the screen. *K* is a feed board which can be raised or lowered to regulate the flow of sand to the machine. *L* is a shelf for carrying off coarse gravel. A single screen four meshes to the inch is made, or any other size required, to be used for screening sand when roofing gravel is not wanted, allowing all the gravel to pass down in front of the machine.

This machine is adapted to the use of plasterers, bricklayers and contractors who have to rescreen sand screened in the old way at the sand banks. A large sized machine is made to be run by horse or water power, with elevator to elevate the sand to the machine and elevator to carry the sand into hiue, core or other places of depoeit. Chambers & Quinlan, of Decatur, Illinois, are the manufacturers.

SILVER.— Silver bullion was quoted in London on Wednesday at 53¾ to 53¾ pence per ounce of the usual fineness. This is an advance of about fourteen cents per ounce from the lowest figures some months ago.

The Leland Coupler.

The Leland coupler is a simple and valuable invention designed to effect a perfect connection of lead pipes without the use of solder, thereby obviating the necessity of fire and dirt, and at the same time creating a more effective joint in half the time, and with much less labor and expense, and, by a series of patent combination faucets associated with the coupler, doing away with many conuections heretofore deemed essential. The coupling of lead to lead, lead to iron, copper to copper, and hose, comprises a most extensive field, so well known to the public that allusion to it at length would be superfluous, as scarcely a factory or building of public or private character but knows its necessity. The construction of this coupler or union will be understood from the sectional view, Fig. 1, its exterior appearance from Fig. 2. It is applied as follows; *A* is a ferrule of brass or other suitable metel, tapered within, and also heving an interior shoulder. There is also an exterior collar at *B*, and a threaded portion adjoining. The ferrule is slipped over the end of the pipe, into the mouth of which a steel or iron shouldered tamp pin is inserted. A few blows of a hammer on the latter distends the metal of the pipe to the taper of the ferrule, and the shoulder of the temp pin forms a facing of the pipe on the shoulder of the ferrule. On the other extremity of the pipe is applied, in precisely the same way, the ferrule, *C*, retained by a shoulder on which is the female union, *D*. A double thimble, *E*, of brass or iron, is then inserted in the month of one part of the pipe; the other end is brought over it, and the thread of the union engages with the threaded portion on the ferrule, *A*. By a few turns of the wrench the parts are drawn tightly together, the distended metal of the pipe itself meeting and forming the joint. The thimble simply fills up the enlargement of the bore produced by tapering the ends, and of course aids in strengthening the connection.

It is stated that the Leland coupler can be attached to a lead pipe and secured inside a minute and a helf, and we are assured that it may he applied with nearly equal facility to the connecting of lead to iron and copper to copper, and parts of hose. It is excellently suited for use on plumbing work in houses, especially at points where both strength and a neat appearance are required. It will he found valuable in proximity to ranges or furnaces, where the best frequently melts the solder, and will probably find an extended application on locomotives. It is also well suited to supersede the somewhat clumsy wire binding used in connecting Westinghouse brake tubes. It may be applied to attach pipes to corporation mains, without turning off the flow of water. It is extremely strong, and has been tested under the severest pressures. For fire and dwelling hose it specially commends itself, being cheap and efficient. The manufacturers state that no sewer gee or foul emanations can possibly escape through the Leland coupling. A great feature is that this coupler is capable of easy application by any one without the aid of a plumber, so that no fire, solder or skill is required to make it available. A company called the Leland coupler company (36 John street, New York,) has been formed to manufacture this convenient coupling.

THE following item will recall old times to California miners: "A letter from Deadwood City, in the Black hills, says that the main business street of that place is in a fair way of being worked out by miners, who had recently struck it big at two different points on the main thoroughfare. One man who had been running a cross-ditch came to the pay streak at the theater, which was evidently built on an old channel of the creek. Since then another party has tapped the channel a short distance below and near the center of the street. What led to the prospecting of the business portion of the town was the discovery of gold in paying quantities in a well that was dug not long ago. Next summer will see most of the business houses in Deadwood set up on stilts."

THE Columbia is at its lowest stage at the Dalles.

CORRESPONDENCE.

Lixiviation of Silver Ores.

EDITORS PRESS:—A short time ago an article on lixiviation of silver ores appeared in the San Francisco *Bulletin*, in which some erroneous statements are made in regard to the history of the introdnotion of this process in Sonora, Mexico. The writer, I think Mr. Smith, tries to demonstrate to the readers not only that he is the original introducer of the lixiviation in Sonora, but also that he is the original inventor of it, not considering that his second assertion lessens the credit of his first, as this process was invented a long time ago by Patera, and in its modification by Kiss.

Before relating the circumstances of the introduction of the leaching in Sonora, I will ask Mr. Smith why, prior to 1868, when he found it impossible to treat his ore with a profit by any of the then naed methods of reduction, viz: amalgamation and smelting, as he says in his communication, why, I ask, did he not in this dilemma by aid of his and his amateur chemist's metallurgical intelligence introduce Pateras or Kiss's process in his hacienda, without going to the expense of engaging me to go with him to Sonora?

In 1868 Mr. G. Kustel and I found that by a combination of Plattner's chlorination and Patera's leaching process, auriferous silver orea can be worked to great advantage, whereby both the silver and the gold is obtained separate, and also the copper if any in the ore. This combination never having been used before, was described and recommended in your paper under the name of "Kustel & Hofmann's process." A full description of it can be found in Mr. Kustel's little book on Roasting, but in order to facilitate the understanding of the following, I have to give a brief explanation of this process.

As mentioned before, the so-called Kustel & Hofmann process is nothing more than a mere combination of Plattner's chlorination and Patera's leaching process, and the operations are as follows: First, the ore is subjected to roasting, whereby towards the end a certain percentage of salt is added in order to chloridize the silver and all the base metals. The roasting must be perfect, and does not consist in a partial desulphurization, as Mr. Smith stated, as it would cause a very expensive chlorination or make it impossible. The roasted ore is moistened and conveyed to wooden tanks provided with filter-bottoms and tight closing wooden covers and impregnated with chlorine gas. The chlorination after roasting is intended to chloridize the gold, at the same time acting also on silver particles that escaped chlorination in roasting. The next operation is the extraction of the gold and all soluble base metals by leaching with water. The gold in the solution is precipitated with sulpbate of iron, the clear solution drawn off, and if containing copper conveyed to large tanks to precipitate the copper with old iron. After this the silver is extracted by a solution of hyposulphite of soda and precipitated with sulphide of sodium. In precipitating the silver with this chemical the solution turns into hyposulphite of soda again, and can be used over and over. The corresponding chemical combinations of calcium can be used to better advantage than those of sodium.

This is, in substance, the process with which we were treating auriferous silver ores in San Francisco, when Mr. Smith called on us and brought some of his ore to be worked. He was so much satisfied with the result that he engaged me at once and induced us to make an application for letters patent for this combined process, in the city of Mexico, in which he should have an interest. We told him that his ore, not containing any gold, did not require chlorination with cold chlorine gas, and a good chloridizing roasting would answer, but he insisted on having the complete process in operation in order to demonstrate it, for the sake of the to be-granted patent, to other mining companies whose ore contained gold.

So we started in September, 1868, for Mexico, provided with a wooden gas generator, three or four carboys of sulphuric acid, some manganese, about 100 pounds of hyposulphite of soda, one barrel of sulphide of sodium, a few thousand feet of lumber and some lead pipes and rubber tubes. When we arrived at La Dura we found that the flood of the Yaqui river had swept away the entire works, with the exception of the battery, which was still standing but half buried in sand and gravel. I mention this only to illustrate the difficulties under which the first introduction of lixiviation in Sonora was performed.

Having built a few cabins to give us and the workmen shelter, we commenced with the erection of the lixiviation works, which was done according to my direction. We built the first long reverberatory roasting furnace in Sonora, of which I drew the plan. Prior to that, Mr. Smith used Bruckner's mechanical furnace, and neither he nor his amateur chemist were familiar with the manipulation of roasting in a reverberatory furnace, but nevertheless Mr. Smith says: "We commenced at once to improve our mechanical appliances, altering our doors so as to effect great economy of fuel and a more thorough chlorinization of the ore." This great improvement, on which Mr. Smith lays so much weight, amounted to nothing more than common cast-iron frames for the working doors, which he ordered from San Francisco. It was of the greatest importance to have the works in running order as quick as possible, and I could, of course, not wait to build the furnace till the iron frames from San Francisco arrived, and consequently left it to Mr. Smith to make this "great improvement."

Having had the works as complete as the circumstances permitted, I commenced with the reduction of the ore, which was a very refractory one, consisting of fahl ore, galena, eight to nine per cent. of zincblende, four to five per cent. copper, some iron pyrites and quartz, and containing from $65 to $100 silver per ton. The ore I subjected to an oxidizing roasting till about one hour before discharging, when I added three to four per cent. of salt and finished with chloridizing roasting at a lower temperature, on account of the copper and zinc in the ore. The result which I obtained was very satisfactory, the tailings not containing more than four to five dollars per ton. As the La Dura ore did not contain any gold, I abandoned the use of the cold chlorine gas as soon as I had the whole works in running order, leaving them at the same time in such a condition as to enable a reduction of auriferous silver ore if such should be brought for treatment from other mines.

The gas generator, a very primitive one, constructed of two wooden tubs of about 30 inches in diameter, cost, including lead pipes, etc., about $50, and was put up and brought in connection with the leaching tanks on special request of Mr. S. for the above mentioned purpose, and not to be used for the La Dura ore. It was therefore a matter of course to abandon the chlorination as soon as the apparatus proved to be in good order and the workmen exercised enough to convince me of their ability to manage the same in my absence; and so I did, using only the second part of the process, which refers to the extraction of silver and copper, viz., chloridizing, roasting and extraction of the silver and copper by Patera's method. If, therefore, Mr. S. in his article says: "The gas generator gave out and in this dilemma, while considering what must to be done, against the earnest protest of Mr. Hofmann, I commenced experimenting on simply roasting the ore in a reverberatory furnace and leaching. I soon found that by careful roasting I obtained as good results as we had before obtained by the former process, and our success was assured," etc. he is simply misrepresenting the true facts for his own edification and benefit.

The dilemma in which we came was not caused by the giving out of the generator, but by the giving out of the chemicals. The barrel of sulphide of sodium was used up, and the ingredients for the manufacture of it, which Mr. S. pretended to have ordered from San Francisco, did not arrive. I had to look for a substitute, and tried to extract the potash from ashes, and to use this in place of soda, but decided finally in favor of lime, which is found in abundance and permits a quicker and easier manufacture of the chemical.

Mr. Smith claims that his amateur chemist suggested to him this idea, who found the formula for making this compound in some medical work. This statement is again incorrect. His amateur chemist, who was our bricklayer, did more harm than good. One night when the leaching vats were in his charge he let the whole solution of hyposulphite of soda with all the silver flow into the river, thinking he was leaching base metals with water. This was a still worse dilemma! We had no more hyposulphite of soda on hand, and consequently had to stop working. I tried to manufacture some hyposulphite of lime by generating sulphurous acid in a carboy and conveying the gas into sulphide of calcium, but the glass vessel burst and with it all our hopes. To order the chemical from San Francisco would have delayed us at least three months.

Finally, by reasoning, I found a way out of this calamity. Knowing that by precipitating with sulphide of calcium the chloride of silver, dissolved in hyposulphite of lime, the former transforms into a hyposulphite, I thought the same process might take place by precipitating chlorides dissolved in water. I leached some roasted ore, precipitated all the chlorides, and found to my great satisfaction the clear solution to dissolve chloride of silver very rapidly. From this moment we were out of trouble, and in a short time had the works in operation again.

I then left La Dura for Trinidad to obey a call of Mr. Alsua, who engaged me to introduce the lixiviation in his hacienda. The Trinidad ore contained so much clay that leaching was impossible, and I had to introduce wet crushing and to concentrate the ore in order to have success. Having found the ore to contain about twelve dollars per ton in gold, I constructed a wooden generator, similar to that one in La Dura, and treated the ore with cold chlorine gas, but finding great difficulty in obtaining the regular supply of sulphuric acid and manganese from San Francisco, as all the transportation had to be done on mule-back in a very mountainous country, I abandoned the chlorination and worked simply with the lixiviation, trying at the same time, by careful roasting, to extract as much of the gold as possible. The use of hyposulphite of lime extracts some gold with the silver, but not perfect, and very variable according to roasting.

"At Trinidad," writes Mr. Smith, "after expending several thousand dollars on Mr. Hofmann's mode of working, the process was abandoned and ours was adopted." This statement is evidently calculated to convey the idea that the several thousand dollars expended by me was loss, while nothing was changed except that a primitive gas generator was discarded and an old mule was killed by the breaking of one of the carboys of sulphuric acid in transporting.

The lixiviation process is so simple that any man can learn to treat it exact in less than a week. The roasting of ores is in no special connection with the lixiviation. A good chloridizing, roasting and oxidation of the base metals so far as practicable is all that is required for the lixiviation as well as for the amalgamation. OTTOKAR HOFMANN.

Chicago, Ill., Oct. 17th.

Peat.

The existence of extensive peat beds in this county, says the Stockton *Independent*, has long been known, and several companies have engaged in its manufacture to a considerable extent. This year, however, for some reason the works have remained idle, and the public are interested to know whether it is caused by a failure of the machinery to do its work, a failure of the crude peat in quality or quantity, a failure of the manufactured peat in the market, or only a temporary financial embarrassment. Specimens that we have seen from the works on Venice island would indicate that there is no fault in the quality of the peat, and we should be glad to hear of the resumption of work in its manufacture, as its production is an industry that will, if successful, be of great importance to our city in furnishing us cheaper and better fuel than is attainable elsewhere, even from the Ione coal mines. A test was made a year ago of the Venice island peat in its adaptability to railroad engines, the severest test to which fuel can be put. A train was run from Oakland wharf to San Jose with uncondensed and air-dried surface peat. The engine steamed easily, but it was pronounced impossible for one man to keep the furnace supplied. The run consumed 3,000 pounds of this peat, as against 1,600 pounds of Seattle coal commonly used. During the same month and with the same variety of peat, on shifting engine No. 116, 13,296 pounds of peat were used. Mileage, 336 miles; 39.57 pounds of peat used per mile. This same engine was accustomed to consume 26.51 pounds of Seattle coal per mile run. This shows that the peat was but two-thirds as valuable as the coal, although in cost the advantage was in favor of the peat. The objection in regard to keeping the furnace supplied would be done away with machinery for condensing the peat. It may be that the lack of this class of machinery at the works already established in this county accounts for their having suspended operations this season.

The Men in the Mines.

George Stokes, formerly connected with the Denver *Tribune*, writes from Deadwood of the men in the mines in the following humorous, yet truthful style:

"The smartest Alecks on all subjects here are men from Montana. The best miners in lean ground are men from California. The men who demand the highest wages and earn the smallest, are from Utah. The men who look you in the eye and ask the most unheard of prices for their claims, hail from Nevada. The most persistent prospectors, and—tell it not in Gath—the ones most given to the contemplation of the cocktail, come from Colorado. The weakest kneed, no-account growlers generally come from down East. One of these told me last week, in a burst of confidence, that he had actually been compelled to 'work for wages since he came here.' I stood appalled, but after considering that he received $24 per week for his services (more than he ever got for a month's elsewhere,) I withdrew my sympathy and went straightway and hunted up a job myself. All the nerveless men, I grieve to say, are not tender feet. Some men come here direct from other mining countries, and if they are not taken into partnership by the luckiest claim-holders on their arrival, they cry, go home; and as a rule we let 'em go."

DIAMOND TUNNEL.—We learn from J. A. Fish, Supt., that early Thursday morning a lode was cut in the heading at 1,136 feet, which shows a good body of ore, averaging six inches in width. A heavy stream of water was also struck, and at the same time the employees in the Dives shaft above noticed that the water fell immediately. A close examination shows that the vein cut in the tunnel crosses the Dives lode in a northeasterly course, thus furnishing drainage to the Dives workings, but the main Dives-Pelican lode is still 50 or 60 feet ahead of the tunnel. Arrangements have lately been made with the owners of the Baxter (called in the tunnel "Number Five") by which they will at once make connection from the tunnel with their surface workings, and have a right of way through the tunnel. By this method, development will be furthered, and both parties benefited.—*Colorado Miner.*

THE Treasury Department has issued a circular requiring sealed cars to be used in transporting across the continent unappraised merchandise subject to import duty.

Silver Queen Concentration Works.

After a considerable expenditure of money and time these works have been placed in complete running order, and are now busily engaged in treating ores. They are situated at the lower end of Georgetown, opposite and a little below Stewart's mill, and are built into the hillside on the terrace plan. The mill is 80 feet in length, the upper floor 25 feet wide, the second floor 25 feet, and the lower floor 80 feet wide. Ore is received on the upper floor, where a Blake crusher takes it in and delivers it to a pair of 20-inch rolls underneath. This crusher and rolls have crushed 4,200 pounds of ore in 30 minutes, and are fully equal to the task of grinding up all the ore the mill can require. From the rolls the ore is conducted to a five-mesh revolving screen, and what will not go through the screen is taken by an elevator back to the rolls again. That which has passed through is carried by another elevator into a pointed box, where water is added and the finest particles are washed off in slime, to be settled and treated on the lowest floor. Next the ore falls into revolving screens which make three sizes of it, and it is now ready for the jigging machines. Of these there are six; two each of the Kember, Morton, and Hartz patterns. Their operations are familiar to our readers; in all, the pressure of water from below is designed to force the lighter portions of the ore to the surface and give the heavy mineral the opportunity to sink first to the bed of machine. These jigs have a capacity of 50 tons daily. The slimes, after settling, are treated in a Cornish buddle, and their valuable components saved, while the tailings from all the operations are discharged into a waste pipe, and conducted to the creek below the mill. A boiler of 80 and an engine of 60-horse power, at the northern end of the building, are amply able to run double the machinery employed. Three men only will be needed in the mill, one at the crusher, one at the jigs, and an engineer. A large amount of ore has been successfully concentrated, and the manager, W. W. Rose, is now in the market to buy any and all grades suitable for concentration. When the wagon road on Democrat mountain is completed, the great reserves of low-grade galena ore now standing in the Rogers, Junction and other mines, will be brought here, and a trade is now being built up with mines near Alvarado and Mill City.—*Colorado Miner.*

Placer Mining on the Upper Boise and Smoky Creek.

Mr. John Pierce, says the *Idaho Statesman*, is down from Upper Boise, where his mining claims are located, 25 miles above the mouth of Feather river. He prospected this ground 14 years ago, and went there this summer and found the ground unoccupied, and after prospecting again, organized a company, composed of himself, Jo Jones, Lew Newton, John Hughs and Jo Baker. They went to work this summer, brought in water, whip-sawed lumber, set sluices, erected hydraulic works, and have their hose, pipes, etc., on the ground, and plenty of grub laid in so that they can commence mining operations early in the spring.

They have plenty of ground which prospects from the grass roots, 30 and 40 feet deep, with good dump; and they will go in some time in March and make a heavy summer's work.

The trouble with these diggings and the Smoky creek mines, some 30 miles farther east, is, they have to lay in their tools and supplies in the fall, for the high water sets them back until July before they can pack anything in. This was the trouble with Hardin & Co. on Smoky creek this season. They had no grub in and they have made only one short run. Hardin was about ready to clean up when Mr. Pierce came out. He will be down in a few days, and thinks they have done well, considering the short time they have run. Jo Pierce & Co.'s claims, on the south or main Boise, from Atlanta, where he will winter, is about 25 miles; and from there over to Smoky creek it is 30 miles. The miners that have been there this season have all laid in grub for next season, and they will go in on snow-shoes and make a good season next year. There is plenty of ground that will pay from $3 to $5 per day that is not taken. There is wood and water in abundance.

NEW SHAFT.—In the Yellow Jacket mine on the Comstock, arrangements have been completed for the starting of a large new working shaft at or near the site of the North Chipman shaft, situated about 2,600 feet to the eastward of the present working shaft. A road is being graded, blacksmith-shop erected, and other preparations completed for a vigorous prosecution of the work. It has not yet been decided as to whether the North Chipman shaft, which is down 100 feet, will be used as a starter or not. This shaft will be sunk to a depth of 800 feet with a small donkey hoisting engine, which will give ample time for the erection of the hoisting and pumping machinery, which in complete fitness, power and durability will have no superior on the line of the Comstock. This shaft will cut the ore vein of the Comstock at a depth of about 3,000 feet from the surface. The site selected for the shaft is close to the railroad, and in every way is one of the most convenient and eligible that it would have been possible to select.

MECHANICAL PROGRESS.

Speed of Pulleys and Cog-Wheels.

A writer for the *Northwestern Lumberman* says: Mr. Thomas Bell, of the Clay street planing-mill, Louisville, Ky., has been for the past 25 years using the following rule for computing the speed of pulleys or cog-gearing or both combined, which is, so far as we know, original with him:

The rule is based upon the proposition that the first motion or number of revolutions of the first shaft, multiplied by the continual product of all the driving pulleys or cogs in the wheels, is equal to the last motion or number of revolutions made by the last shaft, multiplied by the continual product of all the driven pulleys or cogs in wheels. Thus the unknown size of any intermediate pulley, or the number of teeth required in any intermediate cog-wheel, may be determined when the diameters of all the others are known as well as the speed of the first and last shaft. Or the number of revolutions of either first or last shaft may be found when the diameter of all the pulleys and either the speed of the first or the last shaft is known. In belt transmission take the diameter of the pulleys in feet or inches, and the result will be in feet or inches as either is used. In cog-gearing take the number of teeth or cogs in each wheel and they may be calculated indiscriminately with any other unit assumed. This gives a great advantage over the ordinary method.

In computing by this rule draw a perpendicular line and set the number of revolutions of the first shaft on the left of it, then set the diameter or number of cogs in each of the driving pulleys or wheels under it. On the right of the perpendicular line, opposite their respective drivers, set the diameter or number of cogs of each driven pulley or wheel. When this is done, do all the canceling you can, and multiply what is left on each side of the line continually together, including, of course, the number of revolutions of the first driver, whose place is always on the left side of the line, or of the last driven, whose place is on the right side of the line. Then divide the greater product by the lesser one, and the correct speed, or diameter, or number of teeth is obtained. When the speed increases from the first shaft to the last one, the products after multiplication will be greater on the left side, and vice versa.

Example: Suppose a shaft makes 100 revolutions per minute, carrying a driving pulley 60 inches diameter, which drives a pulley on a second shaft 30 inches diameter; on this second shaft there is a 40 inch pulley driving a 20 inch pulley on a third shaft. It is required the number of revolutions of the last pulley or shaft:

No. rev. 1st shaft....100
Diam. 1st driver...2÷4=0 | 30.....diam. 1st driven
Diam. 2d driver...2÷40 | 20.....diam. 2d driven

Then by canceling out 30 and 20 we have remaining on the left side 100×2×2=400, the speed of the third or last shaft.

Or if the revolutions of the first and last shaft are known, and it is desired to ascertain the diameter of any intermediate pulley to give the proper speed to last shaft, proceed as in first example, putting down the diameters of all the pulleys and the number of revolutions of first and last shafts in their proper places, leaving a cipher in the space for pulley the diameter of which is wanted:

No. rev. 1st shaft.....100
Diam. 1st driver....2÷60 | 30.....diam. 1st driven
Diam. 2d driver.(wanted) .0 | 0÷10.....diam. 2d driven
400÷4....No. rev. last shaft

Then by cancellation we have 4 and 10 remaining on the right side of the perpendicular line; 4×10=40 inches, the diameter of intermediate pulley wanted, which in this case is the second driver.

Another example showing cogs and belts mixed will suffice:

No. rev. 1st shaft.....100
Diam. 1st driver...3÷120 | 40.....diam. 1st driven
" 2d " ..4÷60 | 20..... " 2d driven
" 3d " ..2÷40 | 15..... " 3d driven
Teeth 4th " ..5÷100 | 20.....teeth 4th driven
" 5th " ..5÷50 | 10.....teeth 5th driven

Then we have on the left: 100×3×4×2×5×5=60,000—the number of revolutions of last shaft or pinion required.

Since becoming acquainted with Bell's rule (which I may perhaps safely term it), I have used it quite constantly with much convenience; it avoids complication and saves time.

THE CHAMPION BELT.—The *Manufacturer and Builder* had the pleasure of seeing in the warerooms of the New York belting and packing company, of 39 Park Row, the largest belt ever made, being 331 feet long, 4 feet wide and weighing 2 tons, made for Messrs. Gill & Mansfield, the contractors for the large grain elevator to be placed in the building at the foot of Sixtieth street, North river, New York, and which is to be completed on the 1st of November next, for the use of the New York Central & Hudson River railroad.

SWISS NARROW GAUGES.—Narrow gauges seem to meet with great favor in Switzerland, a great many having been lately completed. An exchange informs us of the completion of the road from Geneva to Lausanne, along the Jura mountains. The length of this road is 55 miles, the gauge being one meter. The line was constructed by a local board, who received a subvention of £70,000.

Shape and Strength.

How important it often is to the mechanic to give such shape to his material that it will possess the greatest possible strength. We find in the *Railroad Gazette* a record of some experiments which may be suggestive. The *Gazette* says: The results of the experiments are rather disturbing to some of the ideas which some of us have held, and will compel a general overhauling and correction of established theories. In the numerous discussions of the subject of the dead weight of cars, it has several times been proposed that the round rods used in the construction of cars should be thickened up on the ends on which the thread of the screw is cut, so that the effective diameter of the rod measured at the bottom of the thread would be the same as at the other parts of the rod. It was assumed that the rod, having less transverse section at the bottom of the thread, would be weakest at that point and would consequently break there. Nothing seems plainer, more obvious or more conclusive than this. The results of Mr. Garey's experiments, however, show how dangerous it is to draw such inferences, or rather to act on them without demonstrating them by experiment. He took three rods of seven-eighths, three-quarters and five-eighths inches diameter respectively, and three feet long, and then cut a thread in the ends without upsetting them. The threads were of the U. S. standard sizes. On subjecting them to strains, instead of breaking through the screw, as they seemed in duty bound to do, each one of them broke near the center. At the point of fracture, each of them was very much contracted in section, that is, was drawn down by the tension, as is always the case when soft iron is subjected to severe tensional strain.

The diameter of the rods was, as stated above, seven-eighths, three-fourths and five-eighths. The breaking strain for the first was 43,000 pounds, for the second, 33,000 pounds, while for the third 24,000 pounds sufficed. At the point of fracture the diameter was, respectively, nine-sixteenths, seven-sixteenths and three-eighths; while the stretch of the rods when broken was two and three-fourths, two and five-eighths and two and fifteen-sixteenth inches.

These experiments present an interesting problem, both theoretically and practically. It was stated by Mr. C. A. Smith, formerly master car-builder on the Erie railway, that in practice the rods on cars almost invariably break through the threads. Now, if this is so, the problem becomes still more intricate, and its theory more difficult to explain. If the experience of other car-builders confirms the observation of Mr. Smith, the question then presents itself, why do such rods break at one place while in use on cars and at another in a testing machine. If, as we suspect, this is due to the quality of the material of which they are made, then it indicates anew the importance of testing carefully all the iron which is used, so as to know its quality.

Testing Welded or Soldered Boiler-Plates.

The method recently introduced of manufacturing boiler-shells with welded seams, says the *Manufacturer and Builder*, has led to the construction of a machine for testing the soundness of such welds, their adaptation and value for the purpose in question being of course primarily dependent on this quality.

The contrivance consists of a fixed hydraulic cylinder, 12 inches in diameter, and of 12 inches stroke, connected to a traveling head by rectangular wrought iron bars 5 by 2½ inches, pierced with cotter holes of 11 inch pitch; the platen attached to the hydraulic ram slides along the bars.

When a boiler-shell is to be tested, the traveling head is run out of the way along the rails, and the shell is run in on a truck; the head is brought back to its place, and the cotters are inserted in the nearest cotter holes. Pressure is then applied to the cylinder by means of hydraulic pumps, the ram forces the platen against the end of the shell, and the joint is in this way made ready for the testing process. The shell is now filled with water from a tank by means of a flexible hose inserted into a passage in the platen, while the air escapes by means of a tube in the traveling head, this tube being made to slide diagonally, so as to suit any sized shell; the tube is then closed by means of a cock, and the test pressure is applied by the hydraulic pump.

IN the cloth manufactory of Renesson Fils, of Sedan, there is an electro-magnetic arrangement for stopping the steam engine. In the valve chest is a cock, on the axis of which is a little wheel, round which winds a weighted cord. The weight tends constantly to unroll the cord, and so close the cock, but is prevented doing so by means of a bar obstructing a tooth on the little wheel. This bar can be withdrawn by means of an electro-magnet, which can be worked at any distance from the machine with a constant, or, better, an interrupted current. In experiments made by a commission, the driving wheel did not make more than one and one-fourth to one and one-half revolutions after sending the current.

PULLEYS covered with leather, iron pulleys polished and mahogany pulleys polished, rank for working value as 36, 24 and 25 respectively, wood and iron uncovered being almost identical.

SCIENTIFIC PROGRESS.

The Planet Vulcan.

The observations made on Le Verrier's hypothetical planet Vulcan, on October 2d and October 9th, resulted in nothing. Whether there is an intra-Mercurial planet is consequently an open question with a strong negative. Prof. C. H. F. Peters, the well known director of the Litchfield observatory at Hamilton college, gives the Utica *Herald* the following reasons for his belief that Le Verrier is mistaken:

1. Le Verrier gives the earlier observers of the transit of Mercury the benefit of too much accuracy; had all observations been accurate, no material deviation in the course of Mercury would be observable. Le Verrier's claim that there is a deviation, due to an inter-Mercurial planet, is therefore but an assumption.

2. All the alleged observations of the planet are attended by too many suspicious circumstances to allow them to be accepted as facts. No famous astronomer has ever seen the planet.

3. The most unfavorable condition for the observation of such a planet would be when the plane of its orbit was at right angles with the ecliptic, the duration of a node being then the shortest possible. Under this condition there would be but three and one-half days at each node, or seven days in the year when the observation of a transit would be possible. But it is claimed that this planet is inclined only 13 degrees from the ecliptic. The length of time that it could be seen at each node, therefore, would be 14½ days, or 35 days during the year. It is further claimed that Vulcan revolves around the sun once in about 20 days. During the 35 days in the year it can be seen, it must make almost two revolutions. Hence two transits a year would not be improbable. Astronomers have almost hourly watched the sun for the last 15 or 20 years, but have seen nothing of an event that, if it occurs according to the prescribed conditions, should happen at least once, and often twice a year. Hence, the unauthenticated statements of one or two men that something has occurred which thousands, after years of searching, have not discovered, can not be taken as facts.

4. A planet so near the sun as Vulcan is declared to be, would be intensely illuminated, so that it could easily be seen when outside of the sun, if it really existed.

5. No such planet has ever been seen; no such planet can be seen; there is no such planet.

HORNED MEN IN AFRICA.—There was a paper read before the British Association, written by Capt. J. S. Hay, relating to a strange malformation in the males of a tribe of people he has visited in Akem, in West Africa. An extract is as follows: Two diagrams which are laid before you depict to the best of my ability, and will at least convey some idea of a malformation which is, I believe, peculiar to this tribe. I have at least noticed it in no other. The malformation in question is confined to the male sex, and consists of a protuberance or enlargement of the cheek bones under the eye, which take the form of horns on each side of the nose. The malformation begins in childhood, but is not, so far as I am aware, hereditary. It presents no appearance of being a diseased structure, nor is it a raised cicatrice, after the fashion adopted by many African tribes. On the contrary, I have seen children with this peculiarity of structure, whose parents were doing their utmost, though ineffectually, to stop it by medicines and applications. In the meantime, to set all speculation and conjectures at rest, and to corroborate a statement that doubtless may appear extraordinary, I have lost no time in writing to a missionary, a native of the country, to procure me, if possible, skulls in which the phenomenon appears; and as soon as these arrive it is my intention to exhibit them, in connection with a paper on the subject, which I propose to read at the Anthropological Institute in London.

A NEW PLAGUE IN EGYPT.—A letter from Alexandria, August 27th, says: A new calamity now engages the attention of all Egyptians even more than the financial decrees of the Khedive or the refusal of the government to accept the judgment of the new courts. It seems that many of the cavalry horses that have returned from Abyssinia in the last two months came with a most malignant disease upon them. The doctors pronounce it a kind of typhoid fever. It is most infectious and terribly rapid in its progress, death resulting in many cases in a few hours. It is stated, and on good authority, that the government, instead of isolating the infected animals, sold them all at a very low price to the *fellaheen*. Thus they have been distributed throughout the country, and in the neighborhood of Cairo alone several hundred horses are already reported dead.

AMONG recent communications to the French Academy on the subject of phylloxera was one by M. Theuerd, describing the good results obtained by stripping off the bark of phylloxerized vines. This is easily done by means of a steel glove; and it frees the vine from the insect during the aerial evolution of the latter. The method might prove more advantageous than that which attacks the phylloxera during its subterranean life.

Painless Killing.

Benjamin W. Richardson reports in *Nature* as follows: The latest experimental researches which I have conducted on lower living animals have had for their object the discovery of a ready, cheap and innocuous method for killing without pain those animals which are destined, as yet, for the food of man. If the labor of the physiologist be allowed to progress, the day will soon arrive when the slaughter of animals for food will become unnecessary, since he will be able to so transmute the vegetable world as to produce the most perfect and delicious foods for all purposes of life without calling upon the lower animal world to perform the intermediate chemical changes. But until this time arrives animals will have to be slaughtered, and my research has been directed to make a process, which at present is barbarous and painful, painless in the most perfect degree. For this purpose the various modes of rapid destruction of life—by powerful electrical discharges, by rapid division of the medulla oblongata, and by the inhalation of various narcotic vapors, have been carried out. The experiments, which have been exceeding numerous, have led me to the conclusion that the most perfect of the painless methods of killing is by the inhalation of carbonic oxide gas. So rapid and complete is the action of this gas, that I might say physiological science has done her part, as far as need be done, for making the painless killing of every animal a certain and ready accomplishment, an accomplishment also so simple that the animal going to its fate has merely to be passed through the lethal chamber in order to be brought in senseless sleep into the hands of the slaughterer. The application of teaching and the putting into practice this humane process lies now with the world outside science; but to insure its acceptance all the force of selfishness, of prejudice, and of practical apathy for the sufferings of the animal creation have to be overcome. There is a great deal of talk and a great deal of sentiment abroad on the question of the sufferings of the lower animal kingdom, but when an attempt is really made to relieve those sufferings by the invention of methods for the operating, surgically, without the infliction of pain, or for painless killing, the true vital sympathy which one would expect in support of such practical and humane efforts, until they are made universal, can scarcely be said to be found at all. With the exception of a few, not a dozen altogether, of really humane ladies and gentlemen, I have found no one, out of the ranks of science, in the least interested in the saving of sufferings to which I am now directing attention. The man of science stands and wonders at the strangeness of the psychological problem before him, and, in spite of himself, is forced to the conclusion that, practically, the noise that is made at him in the name of humanity is, after all, sounding brass and tinkling cymbal.

A PRIZE FOR A PROCESS.—An interesting competition is about to be opened by the German society, *Verein von Gas und Wasser Fachmaennern Deutschlands*, which offers a prize of $400 to the author of the process for the economical purification, from carbonic acid, of illuminating gas obtained from coal. The systems now commonly employed involve either hydrate of lime, certain salts, muriate of manganese for example, and iron oxides. Whether these methods leave more or less to be desired, according to the nature of the coal distilled, or whether the forms of the purifiers are imperfect, it is nevertheless certain that carbonic acid still remains present in illuminating gas, and its presence is decidedly unhealthy. Either a new system for its complete removal, or an effective improvement on the older process, is required. The invention must be economical, easy of manipulation and must not lower the illuminating power of the gas. The memoir describing it must be complete, and explain both the theory and the practice. Manuscripts must be signed with some distinctive device, which is to correspond with a similar mark on a sealed packet in which is written the name and address of the author. Communications are to be addressed to the president of the commission, Dr. Schilling, at Munich, prior to December 31st, 1876.—*Engineer.*

BALTIMORE'S GREAT UNIVERSITY.—The staff of Johns Hopkins university, consisting of the president and six professors, 12 associates and 20 fellows, are now assembled, and are engaged in the examination of students and the formation of classes. The number of candidates for admission was much larger than was anticipated. Most of them are from Baltimore and vicinity; but perhaps a fourth come from Virginia, North Carolina and other States. About 20 college graduates (in addition to the fellows) have applied for instruction, many of them in the laboratory of biology. The books and apparatus in physics, chemistry and biology (animal physiology) are arriving constantly. The afternoon lectures have already begun, with the first lecture of Prof. Gildersleeve on Greek lyric poetry. Prof. Rebillon's course on French literature has also begun. These afternoon lectures will be continued through the winter, with courses by Lowell, Child, Whitney, Walker, Hilgard, Newcome, Mallet and others, and are open to ladies as well as gentlemen, whether connected with the university or not.

MINING SUMMARY.

THE following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

AMADOR.

VOLCANO GOLD GRAVEL COMPANY.—Amador *Ledger*, Oct. 21: The most extensive tunneling undertaking ever prosecuted in the county is now being carried on by the above mentioned company. It is known to all that Volcano flat, where gold-bearing gravel is met with in large quantities and of great richness, lies so low that it has been impossible to work it with hydraulics, because of there being insufficient fall to carry off the tailings. Much of the flat, however, has been worked by means of derricks to the depth of 40 or 50 feet. The auriferous gravel reaches down much deeper than this, the bedrock, we believe, never having been touched. Derrick mining is too expensive and inefficient to pay except in patches of unusual richness. The Volcano gold gravel company was organized in San Francisco for the purpose of tunneling through a hill so as to afford an outlet for the water, and enable the ground to be sluiced. The company started work some two months ago, and has kept working steadily ever since. During the past week we visited the tunnel, and were shown through the workings by the genial superintendent, Col. A. Heath. The tunnel has been opened about half a mile below town, at a point in Sutter creek where the width of the channel furnishes abundance of dumping ground. The total length of the tunnel and approaches, when completed, will be 2,240 feet. At present 1,150 is in a distance of 140 feet, with approaches finished 100 feet. The distance to be run in solid rock is about 1,800 feet. When completed it will drain the Volcano basin to a depth of 42 feet 8 inches below its present level. So far the workmanship is first-class, well timbered throughout, and the opening will be large enough to carry off all the water of Sutter creek in winter. The enterprise is estimated to cost at least $60,000, and, if prosecuted energetically without any stoppages, it is expected that the whole thing will be completed before September next. The enterprising promoters are entitled to much credit for inaugurating such a costly undertaking, and it is hoped they will be able to push it to a successful termination, and be amply rewarded for the investment of their labor and capital.

NEW MILL FOR THE GOVER.—The present milling capacity of the Gover has long been inadequate to dispose of all the rock that might be taken from the mine. Hence the company have determined to erect a new mill of 20 stamps—double the size of the present works. Knight & Co., of Sutter Creek, have secured the contract, and a large quantity of lumber is already on the ground. The new mill is being erected some 500 feet from the old one, on lower ground, so as to secure a greater fall for the water.

PHŒNIX MILL.—The additional 20 stamps to the Phœnix mill at Plymouth are now in and ready to be set to work. All the 80 stamps will be crushing rock in the course of a few days.

GRAVEL MINING AT DAYTOWN.—Not only is quartz mining being pushed ahead with unusual activity around Drytown, but gravel mining is also assuming a position of greater importance than it has done for many years. Indeed, it may be asserted that the gravel claims in this vicinity are yielding better than any other similar claims in the county. A number of Mexicans have been working the placers close to the property of the Loyal Lead mining company for years, with very favorable results. None of these claims were prospected to any depth; the deepest of them did not exceed 16 or 20 feet. It seems never to have entered the minds of the owners that the auriferous deposits reached further into the earth. Recently some Austrians purchased one of the claims, and sunk to a depth of 50 or 60 feet, and struck a peculiar kind of gold bearing quartz of great richness. This stroke of fortune has induced the other claims to sink, and we understand that about all of them are now in the same rich ground. A gentleman who visited these mines the other day tells us that 16 windlasses were at work on as many different claims, employing between 60 and 70 men. The pay dirt is washed in pans. Some of it is so full of gold as it can well be, running from $4 per pan to $10 and $15, while a few pans have been washed which yielded much higher even than the last named sum. As might be expected, there is a prospect of litigation to decide the rightful ownership of some of the ground.

CALAVERAS.

GWIN MINE.—Calaveras *Chronicle*, Oct. 24: An immense ledge of fair grade ore has been struck in the 1200-ft level of the Gwin mine, within a few feet of the shaft. In the upper levels it has been necessary to run a considerable distance before striking the pay chute, but at 1200 feet the shaft cuts through the ore. The prospects are flattering that the level now being run will uncover the finest body of ore yet discovered in the mine, placing the Gwin at the head of the producing mines of the Pacific coast. The mills are running on rock from the 1100-ft stopes, and great activity is being displayed in all branches of operations.

LAMPHEAR MINE.—Senator Nunan, Superintendent of the Lamphear mine, is pushing operations with great energy. He has just let a contract for finishing the sinking of the shaft an additional 100 feet, and the contracting parties have commenced work. They are from Sutter Creek, Amador county. Mr. Nunan is also running the 100-ft north and south levels and stoping from both. The hatteries are kept steadily at work and preparations are being vigorously pressed forward in every department. About 80 men are constantly employed about the mine.

BRADY MINE AND MILL.—Things are looking encouragingly at the Brady mine. A tunnel is to be run 200 feet into the hill following the ledge, work upon which has been commenced. The driving of the tunnel will prospect the mine and assist in keeping a supply of ore on hand for crushing. The mill is running steadily with satisfactory results.

EMERSON, the Happy Valley miner, is washing his ledge preparatory to cleaning up. The late rain caused an extensive slide in his ground since, but he had the debris pretty well disposed of when we were there Thursday afternoon. Emerson deserves a rousing "benefit" at his clean-up.

UPPER COUNTRY MINING JOTS.—Work is going on briskly at the Josephine mine, at West Point. Sinking the shaft is progressing, the ledge showing handsomely, and the battery is constantly employed crushing. The Champion is also sinking, the ore increasing in richness as a greater depth is reached. The lower levels are being run in the Mina Rica, and a high grade of ore extracted. Rock from the Deuteronomy mine is being crushed in Henry's mill. A tunnel is being run in the Glencoe Consolidated, at Mosquito, for the purpose of getting the exact bearing of the ledge prior to the erection of powerful machinery. The tunnel will approximate 100 feet in length, cutting the vein at the depth of about 60 feet.

EL DORADO.

THE BONANZA.—*Mountain Democrat*, Oct. 21: Superintendent Rosewarn, of the St. Lawrence mine, was in town the other day, at which time he was confident that the air shaft in the St. Lawrence would be through by the end of this week. Unless he is disappointed in this respect, and he seldom miscalculates mining probabilities, they will commence systematic operations next week, with a view to the thorough development, not only of the recently discovered bonanza, but also of deeper levels. Within a short time we expect to chronicle the fact that one mine in this county has been successfully prospected to a depth of 1,000 feet, and we confidently expect to hail the new year with the announcement that the St. Lawrence is on the list of permanent dividend paying mines.

INYO.

SANTA RITA.—Coso *Mining News*, Oct. 21: Learning that this property is about to be relieved from the lethargic state in which it has been for a long time, we made a visit to the mine a few days ago, and were exceedingly surprised to find a prospect of such fine promise. The mine is situated easterly from Darwin, toward the Lonkout country, about one and a half miles distant, and in a very accessible place for easy working. The owners have a fine spring of water of their own, distant from the mine six or seven miles, the waters of which will be probably utilized by them, instead of buying water. The location is one of the oldest in the district. We visited the mine in company with Mr. Arana, and on arriving there found about 600 tons of ore lying upon the dumps, which had been extracted from an incline shaft sunk upon the ledge to a depth of 100 feet. The croppings of the ledge are hardly observable, in fact it is what might be denominated a "blind ledge." A few feet of sinking, however, disclosed a vein of about three feet in width, which gradually widens out, with scarcely a break in it to the bottom, where it is about 12 feet in width. The ores are similar to those of the Defiance and other mines of this district, combining black sulphurets, gray carbonates and galena, interspersed with a sufficient amount of iron ores to insure its successful and easy running. This excellent property is now placed in the hands of the Hon. H. W. Fortune, of San Francisco, who is a member of the Mexican mining company. He has traveled extensively through Mexico and dealt much in the Comstock mines, and will undoubtedly secure capital to commence active work upon the mine in a short time.

MINIETTA BELLE.—Everything is exceedingly promising in and around the mines. Mountain View ore body is surprisingly rich and extensive. Have just received duplicate of assay No. 3,839 from Henry C. Hanks' laboratory—$1,182.70 per ton. This, I presume, was an unusually rich piece, but the whole vein is first-class ore, and receives the admiration of all who see it. Coburn-cut works are yielding $200 ore. The 45-ft cross-cut stopes in Minietta are yielding one ton per man per day of A No. 1 grade. Bottom south drift still looking well. Commenced to cross-cut west in search of hanging wall three days ago. Work in the north drift is being pushed with all dispatch. On boundary line of Mountain View and Keystone have two men taking out three tons daily of splendid ore. Have now about 2,000 tons on dumps awaiting arrival of the mill; site has been selected for same. Expect to have it up and running under full headway 60 days hence.

THE GELD DISTRICT.—Last week Messrs. J. S. Gorman and Henry Gashwiler made a visit to the gold mines belonging to Messrs. Snow & Grant, situated in Snow's canyon, and we are informed that they were well pleased with all they saw. There is no doubt but that these mines will soon receive the favorable notice of capitalists visiting this camp. It has been demonstrated by arastra process that the quartz is rich, and with a mill for its reduction will yield a handsome revenue. Snow & Grant are preparing to commence active work for the development of their claims.

MONROE.—Mr. Barber, superintendent, came in last Thursday and informs us that the Modoc company's mines never looked better. Connection has been made between Confidence Nos. 3 and 4 by a winze and raise, both being in splendid ore. Two men can now take out from these points a sufficient amount of ore to keep the furnace constantly running. In Confidence No. 4 they are taking out large quantities of ore of a high grade milling quality. The drift is being continued, and is in good ore the entire distance. On the Lookout the tramway is in successful operation and sending ore down to the furnace. A track is being laid in the tunnel for better working facilities. There is no diminution in the large body of ore in this mine, either in quantity or quality. The furnace is working charmingly, and has turned out, since it commenced, 960 bars of bullion, averaging 30 pounds to the bar. Some 500 bars have been shipped from the furnace, en route to San Francisco. The bullion now assays between $400 and $500.

LAKE.

SALD.—Lake *Democrat*, Oct. 21: The Oak Hills mine is now known as the Napa Consolidated quicksilver mining company. Messrs. Vivian, Waleh, Portor and Cook have sold out their interests therein. Consideration, $15,000. Mr. George Senn, the former superintendent, retains his interest.

THE result of the improvements made at the Mt. Jackson furnace, is increased shipments of mercury this week—22 flasks having been shipped below.

MONTEREY.

COAL IN SLACK'S CANYON.—San Benito *Advance*, Oct. 21: For some months past we have had samples of good coal in our office, and its appearance has frequently excited a wish to visit the mine from which it was taken. At the early part of the week we were conveyed to the Red Rock coal district of Slack's canyon, of Monterey county, the locality where the excavations have disclosed immense beds of good commercial coal of pure quality. Having frequently visited the coal districts of England, we know from observation the nature of what is known as the great coal formation. In the locality of the Red Rock coal mine its distinguishing signs are clearly apparent, and the prospect made opens to view the whole suits of strata common to the coal measures, viz: sandstone, bituminous shale, ironstone, pure clay and impure limestone. The hard and black and brilliant stratified beds of coal, varying in thickness, banishes the idea of the formation being recent. We entered one tunnel which penetrates the hillside about 30 feet, and found ourself in a stratum of unknown thickness. This tunnel is eight feet high and six feet wide, and nothing above or below or on the sides is visible but the veritable black diamond. We noticed other excavations at points widely apart and at various elevations on the surface of the hills, where beds thick and thin are visible. Even the little black monnds produced by the burrowing rodents give unmistakable signs of coal; and we are convinced of the existence of a coal field extensive and inexhaustible, sufficient to supply the wants of California for a century. The district is easy of access, and a road can be constructed at a trifling expense to connect with the railway depot at Los Gatos, the point to which the Southern Pacific railroad company is now extending the line from Goshen. The mine and depot are 12 miles apart. Several tons of coal have already been hauled from the mine to Tulare lake, where it has been used satisfactorily for steamboat purposes. At the expiration of a few months, when shipping facilities are perfected, the contents of this mine will supply the trade of the San Joaquin valley and the principal railroad cities of the State.

NEVADA.

NEW ENGLAND GOLD MINING COMPANY.—Nevada *Transcript*, Oct. 21: On the 30th day of August last, the New England gold mining company was incorporated to operate in Nevada county. Messrs. Lockhart & Co, are the owners. The ledge which the company are working is situated on the Grass Valley road, about a mile from town. It was worked as early as 1856, and the rock at that time paid all the way from $30 to $160 to the ton. An incline was run on it to the depth of 110 feet, and only a spur of the main ledge was worked, from which the rock was obtained. When water was reached the original owners had not the wherewith to obtain machinery, and they have consequently held on to the property for 20 years, waiting for some way to turn up whereby they could go to work again and develop the mine. As nothing favorable did turn up, Mr. Hobart, one of the old owners, this year sold out his claim to Lockhart & Co., who have, since the middle of last month, had an engine put in place, hoisting and pumping apparatus attached, a building erected over them, and have sunk a double perpendicular shaft a distance of about 65 feet. It is expected the shaft will tap the ledge at about 150 feet, and it will require about a month more to reach that point. The ledge is ten feet in width, and carries a large proportion of gold bearing sulphurets and galena. We have no doubt Mr. Lockhart will open out a first-class mine. All who are familiar with the rock of that district pronounce the New England to be of the most promising character. Our best wishes attend the enterprise.

NORTH BLOOMFIELD.—L. L. Robinson and Thomas Bell, large owners in the property known as the North Bloomfield gravel mining company, in Bloomfield and Eureka townships, have been up inspecting the property during the past week. They returned to this city on Thursday afternoon, delighted with the future prospects of the company. These gentlemen are original owners in the property, and strange to say, out of about a dozen of men who started into the enterprise, they are the only ones living to-day. From the commencement of the enterprise, about ten years ago, the company has expended over $1,700,000. During the next year they will take out an immense amount of money, as the gravel channel which has been developed is immensely rich.

SOUTH YUBA CANAL COMPANY.—A great many owners of hydraulic claims in this vicinity have been troubled about the sale of the South Yuba canal company to Alvinza Hayward, anticipating that in the future they could not get as much water from the company as they have in the past. We conversed with a gentleman yesterday who is well posted, having had a talk with Mr. Hayward's agent, who was in Grass Valley last week, and therefore the statement in regard to the matter may be relied upon. It is the intention of the company to supply water in this vicinity in a greater quantity than heretofore, if the demand requires it, and also to run the water to Blue Tent in quantities sufficient for their use. Mr. Hayward's water hills for his claims in Placer county have averaged in the neighborhood of $100,000 each season, and he has not been able to get all he required. The property was offered to him for $510,000 and knowing it was a matter of but a few years till he would pay out that much money for water, it was better for him to buy the whole property right out. Mr. Hayward also knew that the outlay of that amount of money would pay him better than any other investment on the coast. The property is worth a million or a million and a half of dollars, and is so estimated by those hereabouts who have a knowledge of the property. It is no wonder, then, that Hayward jumped at the proposition when it was made to him. The increased capacity of dame and reservoirs which will shortly be completed, will enable the miners to get all the water they want, and Hayward's profits will be immense. We also understand that Hayward contemplates acting with the greatest liberality, and intends to accommodate to his utmost ability all who have dealings with the company. The principal office will remain here for the present, but it is thought for the convenience of the company, it may be removed to Gold Run at some future time. In that case, a branch office will be established here.

THE Nevada mine makes out to pan out a very nice bar of bullion every five days. It has been a dividend payer for a long time, and the prospects continue to improve daily as developments go on.

PAY GRIT.—We understand the Red Diamond mine, located up at the Cascades, above Scott's Flat, has very flattering prospects now. An extensive cave some time ago stopped work, and necessitated the running of a bed rock tunnel about 120 feet. The work of running has been completed, and we learn that splendid gravel has been struck, and the miners feel jubilant over the prospect. Peter Hunofauth, A. Lademan, John Dickson and John Williams are the fortunate owners of the property.

BIG CLEAN-UPS.—*Foothill Tidings*, Oct. 21: Recently, the Centennial mine sent another crushing of 50 loads of ore to the Orleans mill, which turned out a gold bar of nearly $5,000 value. A new prospecting party down beyond New York hill, back of the Homeward Bound mine, took four loads to the Larrimer mill a few days ago, which, we understand, gave a return of $2,200 in gold. Such returns from labor bestowed in prospecting should induce more work in that direction on the thousand and one veins known to exist in this vicinity.

HOMEWARD BOUND.—We continue to hear good reports from this mine. A heavy flow of water was met early this week in the south drift, where the ledge is from 18 to 20 inches thick. The north part of the mine is also looking well.

THE Godfrey gravel mining company, out beyond Alta hill, have up their hoisting works, which loom up grandly from their elevated position. Those best posted on the underground workings of the old claims in the vicinity are confident that the Godfrey will get the deep channel.

PLACER.

MINING ITEMS.—Dutch Flat *Forum*, Oct. 19: The branch to connect the Baker shaft with the Yankee tunnel will be finished in a few days, when the work of constructing the sluices in this section of the tunnel below will be commenced. This work will take about three weeks to complete, by which time the Baker claim will be ready for washing. Our miners are sanguine with regard to the approaching season, and predict that at least twice the amount of gold will be taken out that has ever been in any one season heretofore. The claims in this section in which washing will be carried on are as follows: Baker, Yankee, Pacific, Central, Gold Run, Indiana Hill, Illinois, Maryland, Sachs, Gold Run hydraulic mining company, Cedar (limited), Hoskin, Lakamp, Summersett, Brston, Franklin, Elmore Hill, and perhaps the Polar Star and Southern Cross. These claims will give employment to about 300 men, and should they be washing at the same time would require about 14,000 inches of water.

SOUTH FORK OF THE NORTH FORK MINES.—The Luke & Collins company are busy cleaning up undercurrents and canyons and making preparations for the coming water season. The yield of the claim for this season has been good. At the Peelar & Gular claim, although they have worked steadily, the prospects have not been flattering until now. In about two weeks we expect to be able to report returns, which will place this claim among the first in this district. The Dover Bros. and Davis company have turned off the water and are now cleaning up. This claim never fails to pay even wages. The Martell claim is located above Humbug, on the same stream, and embraces a large bar. It has been worked during the summer with such encouraging results that Mr. Martell is now making arrangements to construct a ditch several miles in length, which will furnish water to work with in the future. There is considerable mining done here by Chinamen, but with what result is not known.

BEAR RIVER MINES.—The Richie company have replaced their broken rope with a new steel wire one, three-quarters of an inch thick, and the work is now progressing as usual. The Centennial company have been washing steadily since our last report, and as the drifts advance the prospects become brighter. Everything is favorable for good dividends. The Bartlett company are still pushing their main tunnel ahead, and have passed through considerable ground which they think will pay something over wages. They are busy washing. The Whipple claim has improved considerably lately. They are now working in ground that will pay wages, and it is improving. The Dom Pedro is a new company, located about three-quarters of a mile below the Richie claim, and they have commenced work this week. They are running a tunnel into the hill, with expectations of striking the same channel that passes through the claims above mentioned.

LIWELL HILL MINES.—SWAMP ANGEL.—This company have just completed four prospect drifts on the north side of their main tunnel, which runs due east. Each of these drifts is 75 feet in length, and are being run parallel with each other; they will open up a breast from the back part which will connect the four together at a width of 200 feet. This ground paid something over wages while running the drifts, and will average $10 per day to the man while breasting out. They also have a large force of men at work laying in a supply of timber and wood for the winter, as they use a great deal of these articles for their mining operations.

RISING SUN.—San Juan *Times*, Oct. 21: Our friend Mr. Neff is the superintendent of the Rising Sun mine, situated about one mile from Cofflax, the only paying quartz mine in that section of Placer county. We visited the mine with Mr. Neff on Monday afternoon and found it in full operation. The mill is a ten-stamp one and is run by steam power. The buildings and works are in magnificent order and the mine is paying handsomely. There are three steam engines, all under the same roof, one of which runs the machinery, one operates the pump and the other the hoisting works. The shaft is down about 700 feet and the vein is about 8 inches in width. We saw several specimens of rich quartz which was taken from the 600-ft level. Judging from appearances we should say this quartz mine is a profitable institution.

Nevada.

WASHOE DISTRICT.

AMAZEN & GLASGOW.—Gold Hill *News*, Oct. 19: The new pumping machinery was started into full operation yesterday morning, everything working with the utmost perfection. It is believed that the addition of this pumping machinery will be sufficient to keep the water drained without any further expense at the present. The east clay wall of the ledge has been cut by the shaft at the bottom, and as the ledge is pitching across the line of the shaft and must be penetrated by it while sinking, it has been decided to sink the shaft a depth of 100 feet more before opening a station. It is now down 400 feet.

HALE & NORCROSS.—The pumps are kept busy, but are steadily gaining on the water, and are lowering it at the rate of about 20 feet per day. The new pump both at the 400-ft station has been completed. The lower pump at the 1850-ft level, which was covered by the flood of water a short time since, has been reached and connected with the main pump column above, saving a lift of 180 feet by the air pumps.

COSMOPOLITAN.—Since last report the Hops mill has been running steadily on ore from this mine. There is plenty of ore opened out in the mine to keep the mill running for some time to come. The drifts both north and south from the winze below the main adit level are running in excellent ore, and the stopes and breaste in the upraise above that level continue their good ore yield.

FLORIDA.—No sign of west wall is yet met with in the face of the northwest drift, cross-cutting the ledge at the 400-ft level. The face is in very favorable vein matter, with occasional streaks of good ore.

BALTIC CON.—The main west drift having passed completely through the ore vein into what is thought to be the west country rock, a drift is now being run northward, following the fine ore streak found lying next to the west wall. It is all in quartz and low grade ore of unpromising character.

MEXICAN.—The east cross-cut on the 1300-ft level, started recently to cut the ledge at that point, is making good headway. The upraise on the 1455-ft level is making steady progress, the face still in good ore.

PROSPECT.—The main drift west from the 400-ft station is being steadily advanced toward the ledge. The water is kept reduced below the station without difficulty.

WELLS-FARGO.—The old hoisting works have been torn down to make room for the new building and machinery.

YELLOW JACKET.—The east and west cross-cuts, 100 feet south of the east winze on the 2040-ft level, have jointly been extended a distance of 406 feet east and west, passing nearly the entire distance through lively ledge matter, some of which gave excellent ore assays. Another cross-cut will be started in a day or two more at a point 100 feet south of cross-cut No. 1 on the same level.

CALIFORNIA.—Daily yield, 450 tons of ore. This is being extracted and sent to the mills daily. The ore stopes on both the 1500 and 1600-ft levels are yielding rich ores and are looking as promising for the future as ever. The yield for October thus far is sufficient to insure the payment of the usual monthly dividend of $2 per share. Everything is in the best possible working condition, and with the present facilities for working can be kept up to the 700-ft level and improving as the work progresses both north and south. It is the intention to soon start another mill with a capacity of about 55 tons per day. East cross-cute Nos. 1 and 2, on the 800-ft level, are steadily advancing, the face of each being in soft ledge matter, with heavy stringers and hunchee of rich ore. It is apparent that the east ore body on this level will be reached in a very few days more. A heavier flow of water has been encountered for some daye past in cross-cut No. 3, on the 800-ft level, which has impeded its progress somewhat. The water has been lowered in the main shaft sufficiently to admit of the resumption of work in the main northeast drift on that level.

CON. VIRGINIA.—The daily yield of the mine is 450 tons of ore, which is all that the mills can crush at present. The quality of the ore continues of the same uniform richness as in the past, and the ore breasts show well at every point where the ore is being extracted. On the 1400 ft level the ore breasts going north show a steady improvement. The new Consolidated mill has settled down to regular work, everything working with the utmost perfection. Yield of the mine for October will be amply sufficient to insure the payment of the regular dividend of $2 per share. The west drift from the C. & C. shaft on the 1650-ft level is advancing at the rate of nine feet per day. The north drift on the 1700 ft level is being advanced as rapidly as the great heat and the difficulties under which the work is prosecuted will admit of. A large supply of winter necessaries is being laid in, and every preparation made indicates that the mine will now have a long, uninterrupted and prosperous run. The mine certainly has not been in a better condition or shown a more favorable aspect for the past year than at this time.

IMPERIAL CON.—The south drift from the bottom of the south winze on the 2135-ft level is steadily advancing to connect with the north drift from the Yellow Jacket. The north drift from the bottom of the same winze is also making good progress, the face in soft ledge matter, carrying streaks of fine quartz. The south drift from the bottom of the north winze on the same level is being advanced to meet the north drift from the south winze. The air in all portions of the mine is being wonderfully improved by the new No. 7 Baker's rotary pressure blower, recently erected. The pipe from this blower leading into the mine is 22 inches in diameter, and the benefit already derived from it is very great. On the very lowest levels the thermometer now shows only 92 degrees, where it before stood at 120 and 130 degrees.

TROJAN.—Owing to the unfortunate accident of day

before yesterday work has been suspended until damages could be repaired. All is about in readiness for resumption of work again. Superintendent Westfall has done some very good work since having charge. He sank the main shaft to the 300-ft level, passing through a fine vein of ore which dipped away to the southeast. He then opened a station and drifted for this ore body. The drift is now in 66 feet and has cut into the ore body.

NORTH CARSON.—The whole bottom of the shaft is now in the vein, showing splendid seams of black sulphuret ore. The vein is considerably wider than is shown by the levels above, and of a better character.

OVERMAN.—The north and south drifts on the 1200-ft level are each making good progress, both being in quartz of a fine character. Sinking the main shaft is making the usual fair rate of progress, the rock in the bottom blasting out well. The erection of the new pumping engine is being pressed toward completion. This engine will be equal if not superior to any now in operation or in course of construction on the Comstock. It will be about 700-horse power and be fitted with all the latest improvements.

ALPHA.—The north drift on the 2000-ft level is being pushed vigorously forward, the face of the drift showing some quartz of a good character. The air in the face is much improved.

JULIA.—The new machinery is all in readiness to resume sinking the main shaft, which will be done in a day or two more. The east drift on the 1800-ft level during the week tapped a flow of water so strong that it has been deemed best to suspend work at that point until the heavy head of water is somewhat exhausted.

CHOLLAR-POTOSI.—Daily yield, 100 tons of ore, the assay value of which is $30 per ton. This ore is being taken from the old upper workings and is crushed at mills as fast as it is extracted. Sinking the main incline is progressing at the rate of two and a half feet per day. It is now down 24 feet below the 1600-ft level. Sinking the combination shaft is going steadily forward.

BALTIMORE AND AMERICAN FLAT.—The south drift on the 1050-ft level is being driven ahead, the face still in favorable looking ledge matter. In the east cross-cut from the north drift on the same level some excellent ore has been found. The extent of this ore has not yet been determined.

OPHIR.—Daily yield, 300 tons of ore. The ore stopes are looking well and continue to yield a good supply of high grade ore. The south drift from the bottom of the winze, 60 feet below the 1600-ft level, is showing some fine ore.

LADY WASHINGTON.—The drift east from the 850-ft station, cross-cutting the ledge at that point, is now in 40 feet. Considerable seepage of hot water is met with in the face of the drift, so that it is deemed advisable to stop work there for a short time in order to overhaul the pump and place everything in perfect order, ready for any sudden influx of water which may be encountered.

NEW YORK.—The raising of the pump compartment of the shaft is progressing at the rate of seven feet per day. There is about 300 feet more to raise. Meanwhile the excavations for the pump tanks are completed, and the tanks will be put in forthwith.

SUTRO TUNNEL.—Face of header in somewhat difficult working ground, being porphyry and clay, requiring considerable care and substantial timbering. Total length of tunnel this morning, 14,711 feet. Occasional small seams of quartz and clay have been met with during the last two or three days, which gave low assays.

DAYTON.—The main shaft is being sunk below the 900-ft station deep enough to secure a good sump in which to receive the water, should much be encountered. The north and south lateral drifts on the 700-ft level are both being rapidly advanced.

BEST & BELCHER.—The repairing and retimbering of the double winze that connects the 1500 with the 1700-ft level is completed, and as soon as a little better ventilation of that portion of the mine is obtained, it is the intention to commence cross-cutting and prospecting the ledge on that level.

BULLION.—The north drift on the 1700-ft level is steadily advancing, the face still in very favorable ground. The east drift on the 1600-ft level is showing an improvement. The east cross-cut from the north drift on the 1400-ft level is also looking favorable for a near approach to the ore vein.

CALEDONIA.—The north drift on the 1150 ft level is making good headway, the face in ledge material of a very favorable description.

GLOBE CONSOLIDATED.—The main drift north at the 300-ft level is being pushed ahead in very promising vein matter, giving good assays. The main incline is cleaned out, also the ore shutes, and everything is in readiness to resume the extraction of ore from the old stopes.

UTAH.—The pump tank and hoist at the 900-ft level is completed, and sinking the main shaft has been resumed in good earnest.

TAHOE.—The joint shaft of the Tahoe and Lady Bryan is being sunk at the rate of two and one-half feet per day, the bottom being in soft ledge matter of a very favorable character, carrying spots of lively looking quartz.

LEVIATHAN.—Fine streaks and bunches of ore, giving splendid assays, continue to be cut through by the north drift at the 600-ft level. Every indication goes to show that a good paying ore vein will be opened when cross-cutting shall be deemed advisable.

MELBOURNE.—Sinking the main shaft goes steadily along, with the bottom in quartz of a very promising character, some of which gives low assays.

NIAGARA.—The machinery is again in the best possible working order. Work was resumed in the main incline last Monday morning.

WEST BELCHER.—Work in all the drifts and cross-cuts going ahead as usual, with plenty of good milling ore in sight in the west drift as well as in the upraise above it, which will be utilized whenever milling facilities are secured.

SOUTH OPHIR.—A contract is let for sinking a first-class three-compartment working shaft, and the work will be pushed forward with energy.

SIERRA NEVADA.—The flow of water at the bottom of the shaft is still strong. The prospecting drifts at the 1700-ft station are looking more favorable. The north drifts on both the 1250 and 1500-ft levels are showing an improvement.

GOULD & CURRY.—There is but little doing in the mine at present, except the repairing of the main incline, which is making good progress.

SAVAGE.—The pumps are steadily gaining on the flow of water, which is being lowered in the shaft at the rate of 20 to 25 feet per day.

BUCKEYE.—The main south drift on the 550-ft level running to connect with the south winze is making good progress. The face of the north drift on the same level is still in a fine character of quartz.

ROCK ISLAND.—The flow of water is still too strong to permit of a resumption of the work on the 800-ft level.

ALTA.—Sinking the shaft is being forwarded at a very rapid rate. Everything in and about the mine is working in the best manner possible.

LADY BRYAN.—The erection of the heavy stone masonry for the foundation of the new and powerful pumping machinery is going rapidly forward.

KOSSUTH.—The west drift at the 600-ft station is steadily advancing toward the ore vein, the face in very favorable ledge matter.

HERALD.—Some fine ores has been found in the north cross-cut on the 160-ft level during the week, which is looking fair to form a good sized body.

SUPERIOR.—Running the drift from the ravine to drain the vein to a lower level and connect with the main shaft at the same time, progresses at a very satisfactory rate.

BELCHER.—Daily yield, 300 tons of ore. New pumping machinery is working finely.

Continued on Page 292.

Heavy Mining Machinery.

The New Pumping Machinery of the Belcher and Crown Point Companies.

The Gold Hill *News* thus describes the recent starting up of the new pumping machinery at the Belcher and Crown Point air and drainage shafts, in the presence of a large number of mining men, engineers, mechanics and citizens generally. Mr. Joseph Moore, superintendent of the Risdon iron works, San Francisco, where the new engine was constructed, was present, having come over the mountains for this special purpose. J. P. Rugg, chief engineer of the Belcher works, was on duty. Sam Jones, superintendent of the Crown Point mining company, lent the moral assistance of his presence to the occasion, and W. H. Patton, the constructing engineer, placed his hand on the lever and started the concern in motion. Slowly, gently, quietly did the huge engine obey the touch of the master hand, and in a few minutes the water was flowing upward through the heavy pump column to the surface from the depths of the mine 1,600 feet below. Huge piatons, beams and rods worked slowly but with immense force, and everything worked as successfully as could be expected. It will be three or four days before things generally will be worn smooth, and the entire machinery brought into regular and effective working operation. Technically speaking,

The New Engine

Is a vertical compound, condensing engine, direct acting, with inverted beam, and Cornish double beat valves, controlled by Davy's differential valve gear. The initial cylinder is 30 inches in diameter, with 10 feet 6 inches stroke, and the expansion cylinder is 62 inches in diameter, with 8 feet stroke. The engine, however, can be controlled to any lesser length of stroke, and run to a speed of 10 strokes a minute if required. Its regular working capacity is rated at 500 horse power, yet it can be run up to 600-horse power if desired. It is a ponderous and most powerful affair, compact, very finely finished in all its parts, well made and proportioned in every respect, and, as we before stated, was constructed at the Risdon iron works, San Francisco, from plans and specifications furnished by Mr. Patton himself. Mr. Patton, as is well known, has planned and put up all the heavy engines and machinery of the principal mining works along the Comstock during the last two or three years, therefore is experienced in the matter. This is the first engine of its style yet erected on the Comstock, and is the most powerful now in operation on the Pacific coast. One still more powerful, however, will be started up in about a month, at the Chollar-Norcross-Savage combination shaft, and in two months from now still another at the Overman shaft.

The Steam Supply

Is furnished by boilers of the largest size and most approved pattern. There are three pairs or sets of these in the boiler room, only one or two sets being required at a time, so that one set can be held in reserve in case of accident or repairs. After supplying the big engine the steam passes through a huge exhaust pipe into a compressor of peculiar and very effective style, which operates also in creating the requisite vacuum for the piston of the engine.

The Pump

Is of the usual lift style, and the vertical column is 900 feet in length, the depth of the perpendicular shaft, to which is added the incline portion extending to the 1600-foot level. The column is 14 inches in diameter, and is in sections of 200 feet each, with a tank to each section, thus draining the mine at stations or intervals of 200 feet from top to bottom. From the 1700-foot level the water is raised at present to the lower tank of the main pump by a donkey pump driven by a compressed air engine. The main pump rods are of solid square timber, 14 inches square, which, extending in connected sections from top to bottom of the shaft, forms a tremendous weight of itself, to say nothing of the raising of such a huge column of water from such a great depth. This gives some idea of the tremendous power of the engine.

The Foundations

For all this ponderous machinery are of solid granite masonry 36 feet in depth, and the balance-bob or walking-beam of the pump, working in its deep pit beneath the floor of the works, is massively constructed of iron, 33 feet in length and weighing 50 tons. The center bearing or pivot it works upon is 18 inches in diameter at each end, and 20 inches in the middle between the bearings.

The Hoisting Engine

Used for lowering the workmen and handling machinery, timbers, etc., in the shaft, is of the double cylinder, horizontal pattern and 250-horse power.

The Shaft

Consists of two compartments, each 6x6 feet in the clear, one for the pump and the other for hoisting and lowering workmen, etc., as just described. The perpendicular portion extends to the 900-foot level, and the balance, which continues of the same size, extends to the 1700-foot level, or present bottom of the mine, following the dip of the vein at about an angle of 45 degrees.

The Buildings

Over the shaft and machinery are substantially built of wood, the frame work and everything being of the best and most workmanlike description, the whole being done under the efficient direction of Mr. B. F. Hazeltine, the head carpenter of the Belcher company. The shear or gallows frame over the shaft is a conspicuous novelty, rising to the hight of 85 feet above the foundations of the works. It is 30 feet square at the base and 12 square at the top, splendidly framed of 14-inch timbers, and was erected for handling timbers, machinery, etc. One of the pump rods lowered down the shaft by means of it was 82 feet long. The main building is 50 by 58 feet wide, and the boiler room at the south side, 61 feet long by 46 feet wide. For

Protection Against Fire

Two water tanks are erected on the steep hillside back of the works, each 30 feet long, 20 feet wide and 9 feet deep, furnishing a perpendicular pressure of 180 feet, sufficient to throw water over any portion of the buildings. Hydrants are stationed at convenient points, connected with the tanks aforesaid, and supplied with plenty of hose. The northermost hydrant might be made to throw a splendid stream of water down upon the new public school-house near by, in case of fire, by the addition of two or three lengths more hose. A tank or reservoir is also constructed on a slight elevation just north of the works, for the pump to discharge into. It is 250 feet long by 60 feet wide and 2½ feet deep. Here the water is settled and cooled for use in the works.

Measuring the Continent.

Mr. George A. Fairchild, of the United States coast survey, who is engaged in the transcontinental triangulation, has his headquarters at the Lindell. The object of this geodetic survey is to determine the length of the 39th parallel from the Atlantic to the Pacific coast, and which will connect the surveys of the two coast lines. It will also furnish additional data for determining the shape of the earth's surface, and then all these triangulation points will give accurate data for the surveys of the different States. This will be the longest triangulation ever made in any country, the distance being some 3,000 miles. Eleven measurements of degrees, for determination of the curvature of the earth's surface, have been made by other countries, of which nine only belong to the present century. One was made in Peru, two in the East Indies, and the rest in Europe, all of which have made us acquainted with the size of the globe, and which, together with the "pendulum experiments," have shown that the polar radius is 11½ miles shorter than the equinoctial radius of our terrestrial sphere. In the United States some two or three triangulations have been made; one from Ocracoke to the head of Chesapeake bay—in the arc of the meridian 300 and odd miles long, and which will probably be extended across the States of Pennsylvania and New York. A line of triangulation is also being made from the Atlantic along the Blue Ridge obliquely to the Gulf of Mexico.

The present triangulation across the continent was commenced several years ago. On the Atlantic coast the starting point was on the Chesapeake, and the triangulation is completed to Harper's Ferry, and from the latter point a special reconnoissance has been made to the Ohio river, striking it on the 39th parallel. Coming east from the Pacific coast, Prof. Davidson, of the coast survey, is in charge of the triangulation from a point above San Francisco to the Sierra Nevada. Some three or four years ago the survey was started at St. Louis, working both ways to join the work from the east and west. The starting point was the Second Presbyterian church, of which the exact latitude and longitude were established astronomically, in which the telegraph wires and clock work, both in St. Louis and Washington, were brought into requisition. The work was accomplished after midnight, when the telegraph wires were relieved from business. The observations were repeated night after night when a certain star passed the meridian, in order to secure perfect accuracy. As then determined, the latitude of St. Louis is 38 degs. 38 mins. 0.99-100th sec., and the longitude 90 degs. 12 mins. 13 82-100th secs. Three years ago Major Boyd completed the work of triangulation from St. Louis to the bluffs, establishing a station near French Village and one near Collinsville, and a base line was measured. Mr. Fairfield is now working the other side the bluff, selecting stations with a view of making a reconnoissance to the Ohio river to join the line coming from the East. The country is hilly and wooded, and he finds some difficulty in selecting points so as to see from station to station. Most of the States through which the survey has progressed have, by acts of their Legislatures, made the necessary provision—such as allowing those connected with the survey to go into any man's land, cut down trees, excepting valuable trees and fruit trees—for which damages are to be agreed upon and paid In most cases, if objections are made, the surveyors tender a sum to compensate for damage. People generally cannot understand the purpose of the survey, and are disposed to regard it as a trespass. In one case, a man over on the bluff demanded $2,000 for a slight damage of not over $20.

From St. Louis, where stations were established at the stand-pipe of the insane asylum and Missouri station, the triangulation westward has been completed to the Gasconade river, a length of about 72 miles. Assistant J. A. Sullivan, of the coast survey, is now making a reconnoissance from the Gasconade to the summit of the Rocky mountains, striking a little below Denver. For this purpose he first rides over the three lines of railroad, to get an idea of the topography of the country, and select his station. He returns over the same lines in order to have the day time to inspect that portion passed over in the night on the outgoing trip. The next operation is to go over the route and make a permanent reconnoissance, erect stations, etc., for the work of triangulation. A flat prairie country like the great plains is much more slowly triangulated than a mountainous country. Stations have to be erected every 10 or 15 miles, whereas on the survey of the Blue ridge, for instance, peaks were selected 90 miles distant from each other. In flat countries it is generally necessary to measure a new base line in every 300 miles to serve as a check-line. The triangulation now in progress will take several years yet to complete, and the line runs through the States of Delaware, Maryland, Virginia, West Virginia, Ohio, western part of Kentucky, Indiana, Illinois, Missouri, Kansas, Colorado, Utah, Nevada and California.—*St. Louis Republican.*

Report of the Commissioner of the General Land Office.

Hon. J. Williamson, Commissioner of the General Land office, has furnished the Secretary of the Interior a synopsis of his forthcoming annual report, of which following are the main points of interest: The cash receipts of the office during the fiscal year ended June 30th, aggregate $1,547,215. Total number of acres of public lands disposed of during the year was 5,524,326, of which 2,875,910 acres were absorbed by homestead entries, 507,985 acres were obtained by entries under the timber culture law, 1,008,000 acres were approved to various States as swamp lands, 1,100,078 acres were certified to railroads under land grants of Congress, and 642,692 acres were disposed of by ordinary cash sales. The total disposals were 545,945 acres less than those of the preceding year; 21,806,517 acres were surveyed during the fiscal year, and 68,025,309 acres had been previously surveyed; leaving yet to be surveyed of public lands in the States and Territories of the United States 1,132,665,244 acres. The Commissioner concurs in the opinion of his predecessor that the public domain west of the one hundredth meridian and east of the Sierra Nevada mountains should not be surveyed in minute subdivisions according to the present system, except those small portions which are susceptible of cultivation without artificial irrigation. He furthermore recommends in regard to this portion of the country, that barren lands should be thrown open to purchasers in tracts of unlimited size, as they are worthless without irrigation, which cannot profitably be undertaken for small areas of 160 acres each. He likewise renews the recommendation of Commissioner Burdett, as the only practicable means of preserving the forests of the country from waste and destruction, that Government timber lands should be transferred to private ownership by immediately surveying and offering them for sale in unlimited quantities, at not less than the appraised valuation. Commissioner Williamson also recommends the consolidation of the pre-emption and homestead system, and urges the correction of certain errors in the compilation of the Revised Statutes, and suggests legislation authorizing the bureau to dispose of its publications, such as the "Centennial Map" and the "Centennial Atlas," at prices which will cover their cost and meet the continuous heavy demands for them which have now to be almost invariably refused.

RUSHES.—In an interesting article on rushes, a contributor to the *Gardeners' Chronicle* points out that the plant has really rendered considerable service to commerce. The canals or water-ways constructed by the Duke of Bridgewater owed much of their stability to the rushes that were planted all along their banks, and particularly on the towing-path side, where the fringe of rushes saved the rope from fretting; in short, the plant seemed essential to the canal, for its toughly matted roots bound the banks firmly, and formed the crowning sod, making an elegant fringe, as useful as if it were made of hewn stone. Unlike the working of any shrub or tree that would outgrow its place in a year or two, the rush retains its evergreen wisps to all appearance forever; and hence we see Brindley's rushes little more than a foot high after a generation of boatmen have brushed their tops ten times a day.

RUNNING.—The San Francisco sulphur company, whose mines are situated near Rabbit Hole, have commenced refining sulphur, and are now turning out from four to four and a half tons of pure brimstone daily. They are now shipping to Dayton to fill a contract of several car loads, and have made arrangements with a powder manufacturing company in California to supply them. The attention of the Secretary of the Treasury has been directed by members of the company to the fact that imported brimstone has been admitted free, although the revenue laws require that a duty of ten dollars per ton shall be imposed on all refined sulphur imported into the United States. The enforcement of this act will enable the owners of the extensive sulphur deposits in this county to compete successfully in the home market with the imported article.—*Silver State.*

Hoodlumism and Drink.

It is a well known rule among ths Chinese that there ehell be hut one wash-honse in a block. If the eame rnla could ba established among tha Christians with regard to the disposition of drinking houses, or rum holes, ae they are expressly termed among their patrons, a very direct hlow at hoodlumism would be struck. If idleness be the root of hoodlumism, as peopls are generally willing to believe, it is anstained and nonrished by tha sale of cheap liqnors. The nnmbers, given by the statisticians, of the places devoted to liquor traffic, ara perfectly appalling; but a walk through the onter edges of tbe city will oonvince the skeptical of their truth. Thera is no more familiar sign decking onr streets tben the foaming glass of beer, with the allnring words underneath, "five cents a glass." These cheap cellare and sbops, where alcohollo liquors are sold at correspondingly low rates, are the favorite lonnging places of idlers and the scenes of innnmerabla brawls. It is impossible for the law to get at the root of the matter by breaking up the patrouege. It is not easy to restrain any person or class of persone from visitiug thes. places. In any casa snch a law would be a dead letter, with a body of police who are afraid to interfere with hoodlnms in the opeu street, to say nothing of atemming the lawlessuess of a crowd of striplings inflamed with liquor. It is with tbe dispensers of liquor that the law will be obliged to deel. It will be easy enough to limit the number of places within a certain area at wbich liqnor may be sold, since its sale is one nf tha uecessary evils, and, if the law be rigidly adhered to, even so simple a movement will have its weight in decreasing hoodlumism. In additioa to this, the conseut of a mejority of tha neighborhood shonld be obtaiued for the establishment of a saloon, eiuce it is a nuisance, in that it not only dieturbs the people, but deteriorates the valne of property. Also, the keeper of a saloon shonld be a man of attested good cheracter. Such a one wonld have some care about tha class of habitues whom he permitted to trade at his counter. It wonld be a still greater improvemeut if a brawl, or a specified unmber of brawls, would insure tbe immediate closing up of the saloon where they occurred. If the hoodlum were met at the threshold with a warning, if he had uo comfortable place in which to lonnga, to brew miechief and to etnpefy himself with cheap drame, he would be driven to work deepite himself and his idle habits for sheer necessity of paseing the time. Another evil resultiug from the eame cause is the eese with which yonng chiidren learn to drink. Mora than once the police have come npon a den of youug hoodlums, either under some accommodating house, or in a vacant lot, where the entire gang were stupefied with beer procured for a trifle at eome adjoiuing groggery. The oldest of the crowd in such caees is rarely more than 14 or 15 yeare old. The man who will eell liquor to euch children sadly needs the pressure of the law. It will certainly be necessary to put it in effect somewhere in the liquor bnsinees, or hoodlnmism will shortly be beyoud control.—*San Francisco Alta.*

Sunday on the Comstock.

Any oitizen of Virginia City, with a seuse of humor in hie composition, would aek no better fun, we should think, than to act as guide to eome Massachusetts stranger on a Sunday evening promeuade through the oity of the Comstock. The 130 seloons of C street, with glaring lighte and widely-opened doors; the sound of "No. 46 for a starter," and the réaounding yell of "keno;" the brass band invitation to the melodeon; the cigar-smoking, lonuging, laughing and ewearing orowds npon the etreet ooraers—to say nothing of the sights upon the street a little down the hill from C etreet. What a chill of horror wonld they eend through the veine of the staid New Englauder. Would not his eetabliehed ideae that the earth wes made for the ohildren of the Lord, and that the people of New England are his children, be eomewhat confused? "Are we in America?" he wonld exolaim, and if hie companiou had hie wite about him he would anewer, "No, we are on the Cometock." Sunday on the Comstock ie indeed somewhat unique —work going on in all the minee, horse raoing and dog fighting at the race-track, gambling in the ealoone, lonnging on the streets—all forming a picture *sui generis*. Whether we ought to be proud of it or regretful is a question which need not be discussed, since we cauuot alter the existing condition of thinge if we would. But certainly we oau eend any New Englander back to the blue lawe and bitter Sebbath, with the valuable knowledge that although Bostou may be the hub of the univeree, it hae one very lively epoke.—*Virginia Chronicle.*

Singular Specimen.—Recently, while preparing the fonndatione for the new pumping machinery at the Gould & Carry, the workmen had oocasiou to break a large piece of volcanic tufa, of which the fonndations are being laid, aud there found a geode coataining some beautiful stellated bunchee of fibroue gypsum. The cryetale are from oue-helf to an inch in length and as olear as water. The singularity is that these cryetale ehould be found in the heart of a great rock quarry of leelite or rhyolite, for such is the tufa formatiou from which the geode wae taken. It is to be presented by Superintendeut Osbistou, throngh Professor Stewart, to the Society of Pacific Coast Pioneers.—*Virginia Enterprise.*

Useful Information.

How Pebble Jewelry is Made.

Tho following interesting facts concerning the manufactnre of "pebble jewelry," are taken from the *British Trade Journal*: The gold used by jewelers is always alloyed with certain proportions of puro silver and the finest copper, according to the quality desired. Tbe joweler melts his metals in a crncible and oasts them into ingots about two inches broad, three inches long, and one-eigbth of an inch thiok. The ingots are reduced to any degree of tbinness by being passed between steel rollere. The sheets or plates of metal thns produced are intrusted to a workman, who, guided hy drawings or models, clipe out the pieces required for the various articles to be made. The pieces are giveu, along with the designs, to other workmeu, who pnt them together. These meu are seated at large tables, ronnd the sides of which are a series of semiciroular recesses, each recess being occnpied by a workman. After the pieces are brought to the exaot size reqnired, they are soldered together by means of a blowpipe. Articles of an ornate character, such as broooches and bracelets covered with designs in filigree work or inleid with pebblee, require great nicety of manipulation, and the number of parte which go to compose eome of them ie immense. Pebble bracelets of a finely worked geometrical patteru are made in wuich there are no fewer thau 160 pieces of stone. Ia making an article whioh is to be inlaid with pebbles, the jeweler forms a back or foundatiou, to which a plate p'erced with apertures for the pebbles ie fixed, a convenient space being left between the two plates. At thie stage the work is passed to the lapidary, who cute and fixes the pebblee. The etones are first cut with a revolving disc of iron charged with diamond dust and oil, and roughly ehaped witb a pair of pincere. Each piece is theu taken in succession and attached to a "cement etick"—a small piece of wood with a quentity of etrong cemeut on one end. Held in that way the stone ie grouud to the required shepe on a revolving disc of leed charged with emery and water. Wheu all the pieces are brought to the shepe of the apertures designed for them they are set iu ehellec. The outer surface has up to this time been left rough, but after the cement hes hardened tbe lepidary tekes the brooch in his hand and manipuletes it on the grinding diso until the etone is reduced to the level of the metal whioh surrounds it. The surface is next polished on a disc of tin charged with rotteu stone and water, and the brooch is returned to the jeweler. Usually pebble brooches have in the centre a "oeirngorm," or what ie euppoeed to be one. The cairngorms are not "set" until the work on the other parts of the broooh is all but completed. The exposed surface of the metal on the face of the brooch is uenally relieved by engraved scroll-work. Eaemeled jewelry has recently oome into fashiou to eome extent, and fine specimene have been produced, the Ruuic petterns especially being very pretty.

Adulteration of Sugar.

The *Manufacturer and Builder* says thet all this talk about adulterated suger is exaggerated. We have tried to find adulterated sugar, and cannot succeed. What, indeed, would the menufacturere adulterate it with? People talk of merble-dust; this would at once be detected by its grittiness. Adulteration with starch, as some etorekeepere have told ue ie practiced by eome refiners, would at once be discovered when diesolving the sugar in pure water, wheu the etarch would cauee the water to become milky, and finally settle at the bottom. It doee not require a pure eugar at all to meke ceudiee; nothing is adulterated more then these. They put staroh, flour, chalk, or other thinge in them, if nothing woree. Iu order to chenge the crystallizeble sagar into the nou-crystallizable, which is the best for oendies, all that is necessary ie to boil it long enough; this will at the same time remove the most common adulteration—water or moisture. In answer to the queetion what they have that they call eugar, we can eay they have nothiug elee, ae engar is so cheap and plentiful now-a-deys that it is not worth while adulteratiug it. They nee oane eugar, however, to adulterate other thinge, euch as maple sugar; most that ie sold in the market ie 75 per ceut. or more oommou hrown eugar, flavored witn maple sugar. The eame may be eaid of houey, the kind eold iu bottles being eugar syrup, flavored with some real honey. Glycerine has been adultered with sugar syrup. Then many wines and cordials are eweeteued with sugar, if deficient naturally; jelliee and other like articles coneist largely of engar. There ie ecarcely an end to the substancee in which eugar enters, either as an adulterant or ae a regular constituent, eo eettle your mind in regard to bad eugar; there is perheps no article generally more pure and reliable in the market, and in order to satisfy your mind on thie point, try to adulterate it yourself, and you will soon eee the fallacy of all the talk about it.

Polishing Wood Carving.—Take a piece of wadding, soft and pliable, and drop a few drope of white or traneparent polieh, according to tbe color of the wood. Wrap the wetted wadding up in a piece of old linen, forming it into a pad; hold the pad by the enrplue liuen; touch the pad with oue or two drope of liuseed oil. Pass the pad gently over the parts to be polished, working it round in emall circles, occasionally re-wetting the wadding in polieh, and the pad with a drop or eo of oil. Tbe object of the oil is merely to cause the pad to rnn over the wood easily without sticking, therefore as little as possible ehould be used, as it tends to deaden the polish to a certain extent. Where a oarving is to be polished after having been varnished, the same process is neceesary, hnt it cau only be applied to the plainer portione of the work. Plain surfaces mnst be made perfectly smooth with sand paper before polishing, as every scratch or mark will show twice as badly after the operation. When the polisb is first rubbed on the wood, it is called the *bodying in*; it will sink into the wood and not give much glaze. It must, when dry, have another body rubbed on, and a third generally finishes it; bnt if not, the operation must be repeeted. Just before the task is completed, greasy smears will show themselves; these will disappear by continning the gentle rubbiug without oiling the pad.

Uses for Infusorial Earth.

We have made meutiou from time to time of the depoeits of infusorial earth in this Stete, and of the error which has been made in supposing them porcelain clay. There are uses for infusorial earth. Tbe *Scientific American* names some of them ae followe:

Infusorial earth, or tripoli, is best kuown as a polishing powder for gold, silver, etc., for which purpose it has uo rival. Mention has already been made of its use in the manufactnre of blasting powdere, in which it serves the useful purpoee of holding the explosive nitroglycerine. Bnt these will ultimetely be counted among the least of its uses. Already it playe an importent part in the manufacture of cements and artificial stones, especially iu Ransome's process. Combiued with carbouate of magnesia it forms the excellent cement known in Germany as albolite. With borate of lime it forme a valuable glazing for furneces, pottery, etc., and is found very useful as an enemel for irou and slate. Fnsed with borate of magnesia it forms a beeutiful and durable porcelain, which can be cast and even blown like glass. A multitude of minor uses have been suggested, aud meny more will no doubt follow as our artisans become acquainted with ite properties. Its lightness, indestructibility by fire, and slowuess of heat conductiou ere qualities of very great value. Bricks of it, with a little cley, are neerly as strong as common bricks, yet eo light as to float on water. At the eame time they are infueible, end such poor conductors of heat that they may be held at one eud while the other is heated to reduess. As an experimeut, au Italian engineer conetructed the powder magazine of a wooden vessel with such hricks, aud when eet on fire the vessel bnraed till ehe sank without exploding the powder. The lightness of such fireproof bricke makas them epecially valueble for such uees. They heve also been used to advantage in the construction of reverberetory furnaces, pyrometers, etc. The heat-reeisting quality of infueorial earth makes it not less useful as a protection to ice bine, ale oellere, etc, and as a lining for fireproof safes and the like, for which purposee it ie rivaled only by aebestos.

How to Dry Flowers with Sand.—The *Floral Cabinet* eaye: There are meny of our brilliant flowers—euch ae deh ies, pansiee, pinke, gereniums, sweet williams, carnations, gladiolue, which may be preeerved so es to retain their oolor for yeara. Wbite flowers will uot answer for thie purpose; nor any succulent plant, as hyacinthe or cactus. Take deep dishee, or those of sufficient depth to ellow the flowers to be covered an inch deep with eend. Get the oommon white eand, euch as is used for ecouring purposes, cover the bottom of the dieh with e layer half an inch deep, and then lay in the flowere, with their etems downwerd, holding them firmly in place while you sprinkle more eaud over them, nntil all placee between the petele are filled and tbe flowers buried out of eight. A broad dish will accommodate quite a large number. Allow efficient sand between. Set the dieh in a dry, warm place, where they will dry gradually, and at the end of a week pour off the sand and examine them. If there ie any moisture in the eand it must be dried out before using again, or fresh eand may be poured over them the same ae before.

Good Health.

Drainage and Disease.

The bearing of geology upon health is not very evident at first eight, but the New York *Tribune* eays it was fully exponnded by Mr. Jamee T. Gardner at the meeting in Boetou last week of the American health aseociation. Many dieeaeee arise from defective drainage, and thie in turn ie frequently a reenlt of the etructure of the rocke below. A thorough survey of the State will furnieh the facte in regard to the natural drainage of each portiou of it, and it will then be in order to diecnes the claime of different localitiee in regard to superior saluhrity. Meanwhile it ie well to remember that the whole teudenoy of recent inveetigations proves that the controlling cauee of our moet fatal diseasee is to be found in local conditions. Powerfnl as are climatic influences in modifyiug forms of life, scienoe teaches that death dwells uot so often in the "viewless winds," whioh man can neither direct or restrain, as in the earth beneath hie feet. Fourteen years ago Dr. Henry I. Bowditch demonstrated before the State medical society that certain conditions of the soil slew annually, in Massechusetts, a thousand of her citizens hy consnmption alone. No plan for artificial drainege can be completely succeesful unless besed on a thorough comprehension of the natnral drainage system of the area nnder treatment. The region above the Palisades on the Hudson fnrnishes excellent illustration of these statements. The platean fronte the river eastward with a bluff 300 feet high, end westward slopes gently to the Hackenseck valley, its altitude and proximity to the sea both tending to temper the snmmer olimate. All topographical conditions of nnnsual health seem here present, and yet malarial diseasee abonud. The reason for this will probably be found in the confignration of the rock. The dense basalt underlying the thin soil of the plateau absorbs almost no water. If the rock were either fissured or porous, the hight of the plateau would ineure perfect underdreining; but as it is, we heve probably on the Palisedes topographical conditione favoriug health, while the underlying structnre is the governing canee of prevailing diseases. In coutrast, consider the formation of the Helderberg platean, lying also near the Hndson river. An escarpment 1,000 feet high bonnds, on the eastern side, the table-land, composed of horizoutal limestone resting on shales. Mr. Gardner recently examined the natural drainage system of thie elevated region. From the more level parts water does not pese off by eurface streame. Low undulatious divide these areas into many separate basins, eech dreining toward its owu center, where a funnel-ehaped opening in limestone receives the disappearing flow, whose fnture course is subterrenean. The plateau's elevation insures that theee waters sink at once many hnudred feet, or escape in epringe along the cliffs. Bnt this seme Helderberg limestone, nuder different topographical conditions, has proved one of the most powerful producere of diseese. When oholera prevailed in this country the mortelity at Sandusky was excessive, and some observers hastened to the conclusion that limestone regione were especially lieble to the terrible scourge. The truth, as expleined by the State geologist of New York, Prof. Jamee Hall, appears to have been this: Sandusky is indeed underlaid hy Helderberg limestone, through whoee many open fissures much foul surface weter of the city easily aud certeinly found ite way downward, but as the streets have an elevation of only 30 or 40 feet above the leke, the drainage sank this small distance and there remeined, while its poisonous gases rose continually through the same open fissures by which the water descended, proving that the very geological conditioue which, in combination with other topographical features, appear most favorable to health, here spread beneath Sandusky a deadly uetwork of opeu drains with uo outfall.

Beware of Dust.

The injuries done by duet are among the moet eerioue to which mechanics end operatives are subjected. Wherever filings and fine particlee of any kind are produced, it is very important to prevent their introduction into the lungs; even an occasionel exposure mey do herm, and one continued for mouthe aud years will certainly produce fatnl reeults.

Dr. B. W. Richardson, of Loudon, after several experimente with inhaling air throngh cotton, layers of orepe, eto., iuforme ue thet he finds the best arrangement to be a number of feathers erranged around the outeide of a perforeted breathing tube of convenient size, so ae to closely cover all the perforatione; by breathing through the tube the feathers are drawn down to the perforations by iuepiratioa, and hy expiration they ere lifted from the openings, and all the intercepted duet is blown off. The latter makes the arrangemeute with cottou or crape objectioneble, as their pores are soon filled with the duet as well as the moisture exhaled by the breath. The tnbe is attached to an arrangement which allows it to he put on and taken off as easily as a pair of spectaclee.

A natural protectiou against breathing dust ie aleo afforded to most males of the Caucasian race in the beard and hairs around the mouth. Theee should not be removed by any persons exposed to a dusty atmosphere, who, therefore, do a very unwiee thing if they indulge in the vice of shaving, which is nothing less than an attempt to improve upon nature'e protective provicione. Three evils result from thie practice: 1st. Stimulating the continual growth of the hair, which will become slow, and finally ccase if not interfered with, while thie etimulated growth is a eteady nnuecessary drain on the powere of the vital eyetem. 2d. The removal of a natnral protection againet cold from a place where this protection is more needed than is generally supposed. 3d. The removal of a duet-protector, above referred to. Men inclined to pulmonary consumptiou should especially guard against shaviug, and let their heards grow ae nature intended, only curtailing a little when it becomes inconveuieatly long.

Another natnral protectiou againet dust may be eecured by accuetoming oneself to breathing exclueively through the nose, and only through the month when epeaking.

MINING AND SCIENTIFIC PRESS.

W. B. EWER.....SENIOR EDITOR.

DEWEY & CO., Publishers.

A. T. DEWEY, GEO. H. STRONG
W. B. EWER, JNO. L. BOONE

Office, No. 224 Sansome St., S. E. Corner of California St., San Francisco.

Subscription and Advertising Rates:

ADVERTISING RATES.—1 week.	1 month.	3 mos.	12 mos.
Per line.....	.25	.80	$2.00	$5.00
Half inch (1 square)...	$1.00	3.00	7.50	24.00
One inch.....	1.50	4.00	12.00	40.00

Four weeks are rated a month.

Large advertisements at favorable rates. Special or reading notices, legal advertisements, notices appearing in extraordinary type or in particular parts of the paper inserted at special rates.

SUBSCRIPTIONS payable in advance—For one year, $4; six months, $2.25; three months, $1.25. Remittances by Registered letters or P. O. orders at our risk.

SAMPLE COPIES.—Occasionally we send copies of this paper to persons who we believe would be benefited by subscribing for it, or willing to assist us in extending its circulation. We call the attention of such to our prospectus and terms of subscription.

THE ORIGINAL ARTICLES in this paper are mostly set in solid type, giving in our columns one-third more reading than is contained in ordinary leaded matter.

ADDRESS all letters to the firm, and not to individual members, or others, who may at any time be absent from our office.

Our latest forms go to press on Thursday evening.

San Francisco:

Saturday Morning, Oct 28, 1876.

TABLE OF CONTENTS.

GENERAL EDITORIALS.—Items of Interest from the Mines; Sand and Gravel Separator; The Leland Coupler, 281. Gold in the Sacramento River; Why Fine Gold Floats; Notices of Recent Patents, 288. Remarks on Quicksilver; A Remarkable Timepiece; Crater Forms; Great Whaling Disaster, 289. Patents and Inventions; Hendy's Ore Feeder, 292.

ILLUSTRATIONS.—The Leland Patent Coupling; Improved Land and Gravel Separator, 281. Jnvet's Time Globe; Dental Cup, Fire-hole Basin, 289.

CORRESPONDENCE. — Lixiviation of Silver Ores, 282.

MECHANICAL PROGRESS.—Speed of Pulleys and Cog-Wheels; The Champion Belt; Swiss Narrow Gauges; Shape and Strength; Testing Welded or Soldered Boiler Plates, 283.

SCIENTIFIC PROGRESS.—The Planet Vulcan; Horned Men in Africa; A New Plague in Egypt; Painless Killing; A Prize for a Process; Baltimore's Great University, 283.

MINING & STOCK MARKET.—Sales at the San Francisco, Pacific and California Stock Boards; Notices of Assessments; Meetings and Dividends; Review of the Stock Market for the Week, 284.

MINING SUMMARY from various counties in California, Nevada, Arizona, Colorado, Idaho, Utah and Oregon, 285-86-92.

USEFUL INFORMATION.—How Pebble Jewelry is Made; Adulteration of Sugar; Polishing Wood Carving; Uses of Infusorial Earth; How to Dry Flowers with Sand, 287.

GOOD HEALTH.—Drainage and Disease; Beware of Dust, 287.

GENERAL NEWS.—General News Items and Miscellaneous Paragraphs, on 292 and other pages.

MISCELLANEOUS ARTICLES.—Peat; The Men in the Mines; Diamond Tunnel; Silver Queen Concentration Works; Placer Mining on the Upper Boise and Smoky Creek; New Shaft, 282. Heavy Mining Machinery; Measuring the Continent; Report of the Commissioner of the General Land Office; Rushes; Running, 286. Hoodlumism and Drink; Sunday on the Comstock; Singular Specimen, 287.

NEW ADVERTISEMENTS.

Pickering Engine Governors, Neylan & Young, S. F.; Great Western Scroll Saw Company, Leavenworth, Kansas; Roasting Furnace, G. T. Deetken, Grass Valley, Cal.; $1,000 Challenge Ore Feeder, J. Hendy, S. F.

ABOUT the Black hills a correspondent says: In the first place, everything is taken up; and in the next place, there are not a dozen claims paying. The gold is very much spotted. There have been but two claims that paid big here. One was a big one. There were $3,000,000 taken out of it this summer, and the parties that owned it left with about 1,600 pounds of dust two weeks ago. Jack McAlear has the other good one. It has been paying him about $150 to $200 to the man per day, but it is not doing him any good. He has some other claims that he is prospecting. There are other claims that are paying him $4 to $20, but not many. Everything seems to be in Deadwood gulch; outside gulches not paying, with the exception of a few claims. Times are very dull here and money scarce.

THE late rain affected the American river greatly, and it rose several feet, its water rushing into the Sacramento with a roaring noise. Cox & Clark's bridge at the mouth of the American was carried away, and a portion of it floated down the Sacramento, and brought up in a pile of drift at the hows of the steamer *Empire City*, and the barge alongside of her, lying just below the bridge. The Sacramento rose about two feet eight inches.

THE gold yield in Montana this year is estimated at 35 per cent. in excess of any season since 1871, and the silver product is nearly double. That is doing pretty well.

IT is said that the Mexican government has leased the silver mines at San Luis Potosi, Guanaxuato and Zacatecas to an English company for $500,000 per annum.

Gold in the Sacramento River.

There are not a few Californians who believe that the time will come when it will pay to work portions of the bed of the Sacramento river for the gold which has been washed into it by hydraulic mining for so many years. The capital required for such an undertaking would be large, and to some the idea seems Utopian. Others, however, are firmly convinced that it will some day be done. Probably the choicest diggings in the State are in those river beds, the only question being how to get at them. Several plans have been devised, but none carried into practice; nor is it likely they will be until the present gravel deposits are worked out, which will not be for many a year.

There can, of course, be no question but that a large quantity of gold is constantly coming down the river with the debris of the stream to points even far below Sacramento. To any one who has carefully considered the nature of gold and gold mining, and the rough manner in which it has been conducted, there is nothing strange or improbable in the supposition that the gold has been constantly accumulating there for many years. Even before mining was carried on in California it must have collected in the bed of this river as well as in the gulches and mountain streams.

The gold found in such abundance in the beds of smaller rivers in early days was but the result of the forces of nature, carrying off debris, washing down hills, and leaving the heavier particles concentrated at low points. What nature did before, man is now doing by artificial means, and doing it much more quickly. Of course, previous to the commencement of work by miners, all the gold was deposited, while now the bulk of it is caught and saved; but still a large quantity goes to waste. Experiments made long since proved without doubt that the sands in the bed of the river, at various places, was worth from $2 to $10 per ton in gold, and the relative value is materially increased by lapse of time. Few have any idea of the amount of debris from hydraulic washings flowing into the river continually night and day; but so great has the quantity become that it has shoaled the river nearly its whole length, made islands, and given the agriculturists so much trouble that it will soon be the subject of congressional investigation in search of a remedy. Of course, the lighter particles float off, but the fine gold gradually sinks and concentrates in the bed of the river, where it will always remain unless means are devised to collect it.

The beds of the rivers of past geological ages are worked in California with great success, and it is from these "dead rivers" that the bulk of our gold product is gathered. In the course of ages the water has cut away hills, reduced the rocks, and carried the debris away, leaving the virgin gold in the bed of the ancient river for man to collect. Mayhap the miner of to-day is but assisting nature in performing a like duty for the benefit of future generations. If this be so, then the miners of the future who may find the bed of the Sacramento when it shall become a "dead river" will strike a veritable bonanza, and will reap a rich reward from the carelessness of the miners of to-day.

The large volume of water now employed cannot but be attended with large loss of gold; but whether it is practicable ever to try to recover that which is lost remains a question. As hydraulic mining ceases gradually the lighter portion of the river bed will naturally be carried off, when, with no large quantity of debris flowing in, the deposit on the bottom will be slowly concentrated and more easily available for working. If, then, it is found that when our present mines are nearly exhausted that gold is in the river bed in sufficient quantities to pay for the outlay even of immense sums, the money and means will, no doubt, be found to get at it.

The old method of wingdams and flume would scarcely do, and some other would have to be devised. It is probable that if anything is ever done in this direction it will be carried out on the plan tried on the Trinity river, and now being done on the Feather river by the Main Feather River company, of which we spoke a short time since. In this instance, where there are known to be rich deposits, the plan adopted is to commence a shaft on the bank of the river at a point opposite the last and richest workings of the former claims and above high water mark, and sink the same below the bedrock underlying the original gravel bed of the river; to run an upward incline drift from the bottom of the shaft through the bedrock into the gravel bed, and then along on the surface of the bedrock, where the most valuable deposits are always found. To prevent the complete success of this plan there is but one contingency, viz: Such an influx of water, seeping through the gravel, as cannot be controlled by a pump, filling the drift and shaft. But it is the belief of the company, which is fortified by the opinion of engineers and miners, that the pipe-clay debris which for many years has been flowing into the river bed from the various hydraulic mines, and which is of a depth varying from 15 to 24 feet, has so puddled the underlying gravel that the percolation of water will not be greater than can be kept down by a powerful pump. We believe that the shaft on the bank of the river has already been started, so that it will not be long before the success or failure of this new principle of mining be demonstrated.

Why Fine Gold Floats.

Although most miners recognize the fact that gold in fine particles will float or remain for some time suspended in water, few know why this is so, as it seems contrary to the principles of gravitation. A series of experiments made a long time since by one competent to judge, proved, first, that fine particles of gold would remain afloat in water of common temperature for over 24 hours; and, second, that when the temperature of the water was raised to, or near to, the boiling point, the suspended particles of gold would subside. Reflecting on these points, the experimenter was reminded of the well-known property possessed by platinum of condensing gases upon its surface, and it seemed no far fetched hypothesis to assume that gold and, probably, most other metals, possessed the same property, though in a less degree. Upon this supposition, the fact that particles of gold did not sink in water in accordance with their specific gravity was readily explained, because the buoyancy of the film of air or other gas adhering to them would more or less counteract their weight, and as the surface of bodies relatively increases as their bulk decreases, it was plain that the smaller the particle of gold the more apt it must be to be kept afloat by a film of gas upon the surface. It also becomes obvious that when the water is heated to a certain degree, the particles of gold suspended therein must subside, because the film of gas sustaining them would be expanded and removed.

On this peculiar characteristic of metals to condense gases, Overman may be cited as an authority (Metallurgy, p. 282), "As not only the specific gravity, but the size of grain and its affinity for water and other minerals, has a decided influence on its tendency to subside, it is evident that the operation of separating minerals is truly one which requires more than common intelligence to perform it well. Iron is by far specifically heavier than quartz, still fine iron filings will float in water, while fine sand sinks directly. Carbon has not the weight of clay, yet carbon sinks sooner in water than clay, but not so in air. Gold is by far heavier than silex, but we may observe, by means of a microscope, a multitude of fine particles of gold suspended in water, while we cannot detect the slightest particle of silicious matter, however fine it may be. The latter will subside more quickly than visible particles of heavy gold. All the metals appear to have a tendency to float on water when in fine particles, some more than others. This is caused by a particle of gas, either air or water gas, adhering to the particle of metal, which causes it to be light and float or become suspended. Precious metals appear to possess more of this quality than others. Sulphurets of metals, oxides, salts and, in fact, all compound matter, do not manifest it. The size of a particle and its form have also some influence in causing heavy matter to subside in water; a large grain will, in all instances, sink faster than a small one."

Unless we accept the explanation that a great deal of gold escapes with the water, despite its high specific gravity, it will be difficult to account for the loss in working with a continuous current from the stamps. We ourselves had some extremely fine gold in a bottle of water, not long since, and, as a matter of curiosity, shook it up and set it on the desk to see how long it would take before settling. On the second morning minute particles could still be seen suspended in the water, although the water had been perfectly quiet in the meantime.

Mining Companies' Troubles.

The Loyal Lead gold mining company brings suit against John Maximillian et al., for an injunction restraining defendants from working or injuring said claim or ground; that said injunction be made perpetual; that plaintiff recover said ground and $10,000 damages for the detention and injury of said property.

Judge Daingerfield of the Twelfth District Court has rendered a decision in favor of David Calderwood, in the case of Calderwood vs. the Rock Island gold and silver mining company for the sum of $15,660. The Court find as a conclusion of law, that Calderwood is entitled to the highest market value of certain shares of mining stock since the suit was commenced, viz. $11.75, amounting in all to the sum of $15,660.

M. J. Fitzgerald and W. H. Simser have brought suit in the Twelfth District Court, against the East Modoc Consolidated mining company and S. E. Holcomb. Plaintiffs allege that in June, 1875, they sold the Topeka, Pittsburg, West Side and East Side mines, in Inyo county, to Holcomb on certain conditions. Holcomb transferred them to the other defendant without any consideration; that Holcomb has failed to perform his part of the contract, and that it is therefore null and void. Judgment is asked to remove any cloud on the title of plaintiffs.

The Coso Consolidated troubles have been settled by the retiring of the old board and the selection of D. L. McDonald, president, and E. H. Gadsby, S. Kahn, J. H. Conway and A. H. Yeazell as the new directors. W. F. Bogart was chosen secretary.

UP to the 1st inst. $3,831,600 has been paid in assessments on the mines of Ely district, Nevada, and $4,432,500 paid in dividends.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of mention:

BOTTLE AND CUP STOPPER.—Carlton Newman, S. F. The first part of the invention relates to an improved method of applying a cup stopper to the mouths and necks of bottles or flasks, and the second part relates to an improvement in the bottles or flasks themselves, by which the inventor increases their capacity and at the same time adapts them to the shape of the cup. In constructing the bottle or flask it is provided with a bulging neck which will fit the bell-shaped mouth of the cup, and above this enlarged neck is made a short neck which is provided with external screw threads. The cup is made to conform to the shape of the short neck and enlarged neck of the bottle; that is, the mouth of the cup is flared or bell-shaped so as to fit the swell of the enlarged neck, while the base of the cup is made to fit the short neck of the bottle, and is supplied with female screws so that when the cup is turned upside down over the neck of the bottle the short neck can be screwed into the base of the cup. In the bottom of the base of the cup is placed a cork, against which the mouth of the bottle will press and make a tight joint when the cup is firmly screwed down; or an india rubber ring may be drawn over the short neck so as to fit upon the shoulder formed by the swell of the enlarged neck. By making the bottle with an enlarged neck, so that it will fill the mouth of the cup, the capacity of the bottle will not only be increased, but the shape of that part of the bottle will conform to the shape of the cup and thus avoid the recesses and projecting edges which would otherwise be formed on each side of the bottle and which are common on other bottles and flasks having cup stoppers. In this way the inventor completely protects the mouth of the cup from dust and dirt, and at the same time the bottle is not so liable to be broken as when the cup projects on each side.

COMBINATION EXCAVATOR AND DUMP CART.—Joseph Price, San Leandro, Alameda county. This invention relates to certain improvements in that class of excavating machines in which a number of buckets are formed on the periphery of one of the bearing wheels of a cart, so that the earth which is turned and deposited in the buckets by a plow attached below the cart body will be lifted by the motion of the wheel and deposited in the box or body of the cart until it is filled, when it can be transported to any desired place and dumped. The arrangement permits the buckets to dump their loads directly into the box without the necessity of using chutes or carriers. The plow will retain its plowing position at any elevation, as both ends of the beam will be raised and lowered simultaneously. By the use of a "spreading" wheel (placed horizontally) the box is filled a level full, and an objection heretofore made to these machines is obviated on account of the piling up of the dirt upon the side of the box next to the elevating wheel. The improvements referred to make this class of excavating, transporting and dumping machines convenient, effective and easy to operate.

MINING ACCIDENTS.—One day this week the catch was pulled from under the cage of the North Consolidated Virginia mine, and it began to descend. After it got started it was found impossible to stop it, and down it went the whole depth of the shaft, the fire rolling from the brake. When it reached the bottom—nearly 1,000 feet—the cable was snapped like a thread and followed the cage to the depths below. There were four men at the time working in the bottom of the shaft but fortunately not one of them was in the compartment when the cage struck. A miner named Frederick Brown was killed last week in the Trojan mine by jumping on a loose cage which dropped down the shaft with him. A man named Lawrence Healy was killed in the Prospect mine by an explosion of giant powder. A blast failed to go off and the unfortunate man returned to the drift, struck a blow with a pick at the opening of the hole, when the blast went off and blew him almost to atoms.

THE *Black Hills Pioneer* says: Deadwood contains 173 business houses of various kinds and degrees. The first house was built on the 28th day of last April. We now have a population of nearly 3,000 people. Can any city on the continent make as good a showing this Centennial year?

OWING to the rain in the mountains in the neighborhood of Hope Valley, the Carson river has grown from a brook to a stream of considerable dimensions. The river is higher now than for several years in October, and all the mills are at work.—*Carson Tribune.*

THE Eberhardt & Aurora company's tunnel, at White Pine, is now completed a distance of 240 feet. The formation they are working in is very hard, but, notwithstanding this, they are making very expeditious headway.

THERE are 5,000 men in and around Deadwood City, Black hills, yet all the prospecting is limited to about 30 miles.

Remarks on Quicksilver.

[Written for the PRESS by SAMUEL PURNELL.—No. 3.]

A favorite form of working small quantities of very rich ores is that of the retort or muffle. The retorta are of iron, heated to a red heat. The powdered ore is mixed with some 15 per cent. of hydrate of lime (varying according to amount of cinnabar present); the mercury distills off and is easily condensed. However, on account of its slowness and great cost, this excellent method can only be used with profit on very rich ores, with which it can be made to work up to 85 or 90 per cent. The advantages of the retort process are greater yield of metal, greater purity of product, prevention of soot and greater healthfulness to the workmen. The retort furnaces are arranged similar to the style familiar in gas works.

The author deems it somewhat singular that managers of quicksilver smelting works have not yet tried the

Revolving Cylindrical Furnace

For roasting their ores, especially the fine ones. There can be little or no question that this style of furnace would most thoroughly roast cinnabar, be healthful for attendants, work very rapidly and with a small expense for fuel and attendance, work fine ores and turn out a very large daily product, and altogether be superior to any of the ordinary forms in cost of construction and cost of reduction. They are no longer an experiment on gold and silver ores, and certainly should not be left untried with cinnabar. All ores to be reduced should be in the form of coarse sand or gravel, and can then be quickly reduced as they pass through the cylinder from end to end, and can be continuously and automatically fed and discharged. The time of reduction need not exceed from three to five hours.

The Fumes

Would be in as good a condition for condensation as though they had come from a shaft furnace; and better, as the heat can be better regulated. The only disadvantage seems to be that machinery to run the cylinder and break all the ore in small pieces would be necessary, which would be but a small drawback in view of the cost and time of reduction being greatly lessened in other respects.

Therefore, again referring to the object of this communication, the author would affirm that in his opinion a partial means of aiding in the development of our low grade mines and preventing a serious state of affairs which seems imminent, consists in the adoption of some form of continuous revolving furnace for smelting cinnabar.

Condensation of Fumes.

The condensation of the fumes from the roasting of poor quicksilver ores is very difficult, and is still essentially the weakest point in the metallurgy of quicksilver. Said Prof. Becker (SCIENTIFIC PRESS, vol. 30, p. 98): "Condensers are an exceedingly important portion of the structure, and no absolutely satisfactory construction has thus far been hit upon." Even a good material for a condenser is difficult to find. Brick is porous, and cast and wrought iron are destroyed by the sulphurous fumes.

The iron condensers attached to the Janin and the Knox & Osborne furnaces had little durability, and the condensers as a whole have not been satisfactory. Wood and glass are the most enduring. The sublimations from rich ores are easily condensed to a high percentage in a condenser of simple form; but when mercurial fumes from poor ores are sent into a condenser a difficulty of great magnitude arises. The small particles of metallic quicksilver are borne along in a relatively very large amount of air and gases, which separate one particle from another; they float in the current. The globules are slightly oxidized and repellant. The particles are in various ways prevented from uniting into a globule of sufficient size to fall through the current by its own weight. Thus these small and dusty globules, consisting of from 50 to 75 per cent. of the fumes from poor ores, are carried along by the gaseous current, and in spite of all mere refrigeration and time and distance traveled, are borne to the external air and are forever lost.

The Redington company have for some years past experimented upon a large scale with several of the most approved forms of modern condensers. The result has been unsatisfactory, and we are informed that the company will hereafter build substantially the old form of the large cooled chamber, as they deem the latter style, with all its objections, more economical and efficient than any of the former ones. From this it will be seen how little real progress has been attained in the complete condensation of fumes from poor ores during this century.

To quote again from Prof. Becker: "The losses in smelting are various and very important, and are not at all very well understood. The whole bulk of gas passing out of the last condenser is saturated with mercury vapor." "Its aggregate per day is considerable." "Another source of loss is the fine dust of mercury suspended in the gas; minute globules so small they fall very slowly through the air, and are, therefore, carried away in the current of gas. The rate at which a spherical body falls through the air depends upon its specific gravity and its size." Therefore, if a metallic particle is small enough it may have so little specific gravity that it will float a long while in the air before it falls, and from this and other conditions surrounding it, the particle may be prevented from cohering and aggregating to another. This difficulty has been understood for some time, and many devices have been employed to arrest these small floating atoms of metal, but their success thus far has not been noticeable.

A Remarkable Timepiece.

Among the exhibits of various timepieces at the Centennial—which may be numbered by thousands, and from all parts of the world—there is none of more interest than the time globe, invented by L. P. Juvet, of Glen Falls, New York, and shown on this page. This

JUVET'S TIME GLOBE.

marvel of mechanical skill shows the time on all quarters of the globe.

The invention has been patented and is thus described by the *Jeweler*: It consists of a globe properly sustained, as shown by the engraving herewith. On this globe, which can be made of any proportionate size desired, is a complete map of the world. A large dial encircles the globe at its equator, at which the time of the various meridians is indicated. At the north pole is a smaller dial which shows the mean time at the place where the globe is located. The remarkable feature of this invention is the fact that by the mechanism inside of it this miniature globe actually revolves, as does the earth, once in every 24 hours. The actual time at any part of the world can be easily and quickly ascertained by reference to the large dial encircling the globe at the equator. It has a sliding Vernier, divided into 360 degrees, by means of which the latitude of localities can be ascertained, or the proper degree of inclination of our own or any other heavenly body illustrated. By setting the globe at the proper angle of inclination, giving the poles the proper direction north and south, and letting light, properly applied, fall upon it, it will give not only the amount of light or darkness each country has, but the very time at which it has it. The clock therefore gives the time, longitude, and latitude of any place in the world, as well as the difference of the same between two or more places.

The time globe is attractive in appearance and would adorn any place in which a timepiece is desirable. It stands in any position, and is a stem winder. Other instruments for noting the changes of the weather, etc., can be added to the case which sustains the globe.

Crater Forms.

In his investigations in the Fire-hole basin, Professor Hayden found a great variety of forms of craters, springs, etc., many of them being similar in shape or appearance to familiar objects. He named many of them in accordance with their peculiarities, such as the "bath-tub," the "punch-bowl," the "dental cup," etc., the latter of which is represented on this page. There are great numbers of these craters or chimneys well worthy of close attention in this remarkable region. Some of them have margins on which there is the most delicate and intricate embroidering, surpassing the most elaborate lace-work. In the bottoms of the reservoirs is the variegated sediment, which aids in giving such a wonderfully gay appearance to the springs. Some are beautifully scolloped around the inner margins with the spongiform or cauliflower masses of silica inside, and the outer surface adorned with the greatest profusion of the pearly beads.

DENTAL CUP, FIRE-HOLE BASIN.

BULLION SHIPMENTS.—The shipments of bullion from prominent mines since our last report have been as follows: California, October 18th, $72,541; Ophir, 18th, $10,931; Chollar, 18th, $14,105; Northern Belle, 17th, $12,143; Comanche, 19th, $8 467; Leopard, 17th, $12,382; Ontario, 20th, $5 981; Northern Belle, 19th, $12,034.82; California, 21st, $124 206.99; Con. Virginia, 21st, $156,017.88; Tyho Con., 16th, $13,221.36; Leopard, 19th, $6,327.56; Manhattan's total shipment to the 20th is $81,530; Ophir, 23d, $10,465.21, total to date, $107,768.19; Tyho Con., 19th, $4,380.14, total to date, $31,303.50; Leopard, 22d, $8,680; Modoc, 21st, 200 bars of bullion; Manhattan, 24th, $13,137; Justice, 24th, $34,000; Northern Belle, 22d, $16,016.19; Arizona, 22d, $3,570.18; Con. Virginia, 24th, $68,515.03; California, 25th, $95,000; Ophir, 24th, $48,205.08, total to date, $155,973 27.

JUDGE SAWYER, of the United States Court, has directed that hereafter declarations of intention to become a citizen shall be made in open court. Judge Dwinelle, of the Fifteenth District Court, has made a similar order.

THE Health Officer is still at work fumigating Chinatown.

Great Whaling Disaster.

Tidings come of a dire disaster to life and property among the intrepid men who hunt the leviathan in our frozen northern waters. The history of whaling is dotted with hardships and disasters, but still the hardy whalers pursue their hazardous occupation. In 1871 there was a catastrophe similar to the one which we are pained to chronicle this week. The story is old and yet ever new. The theme is of painful interest.

The survivors of this latest disaster reached this city on Saturday last on the bark *Florence*. This ship had on board 190 men, being part of the crews of 12 whaling vessels which were abandoned in the Arctic ocean on the 5th of September. The remainder of the crews of these ill fated vessels have gone to Honolulu in the bark *Three Brothers*. For three days after the abandonment of the fleet, the *Florence* had 360 men on board, more than could possibly get below decks at one time.

The following are the names of the abandoned ships: Bark *Onward*, of San Francisco, 303 tons; bark *Cornelius Howland*, of New Bedford, 333 tons; bark *Clara Bell*, of San Francisco, 197 tons; barkentine *Josephine*, of Boston, 598 tons; ship *St. George*, of New Bedford, 393 tons; ship *Camilla*, of Boston, 854 tons; ship *Marengo*, of New Bedford, 478 tons; bark *James Allen*, of New Bedford, 350 tons; bark *Java*, of New Bedford, 309 tons; bark *Acors Barns*, of New London, 297 tons; Hawaiian barks *Desmond* and *Arctic*.

The story of the disaster is like that of numbers which have preceded it. The ships were having a prosperous season, the catch of whales was large, and the sailors plied the harpoon in the face of impending dangers until the threatening ice closed in upon them and they were fast beyond escape in the "ice pack." The masters of the lost ships have prepared a statement of the hardships they suffered, and from this we take several paragraphs.

Two ships were first enchained in the ice, and soon afterward escape was cut off from the remaining ten. At times they could see the open water, but could not move an inch toward it, being held by the ice as by a vice, and drifting into different positions. The icebergs were immense, some of them being fully three miles in length. When I speak of an ice pack, I do not mean a smooth, uniform surface, like the face of the ocean in a calm; but a broken, heaped up, irregular jam of ice-blocks drifted ashore by the sea and the wind from the north and east, and hemming us in beyond all possible chance of extrication.

It was finally decided that, to save our lives, we should be compelled to abandon our ships and face unknown hardships and danger in a struggle for life. September 8th was the day chosen for the final start, if nothing turned out in our favor. The ships at this time were moving slowly, frozen hard and fast, in the pack. During the night it came on a thick northeast snow storm, and at daybreak all hands were started, a hasty meal taken, and in the face of a heavy snow storm we commenced our dreary and uncertain march. Thus we marched day after day for a week, undergoing the severest privations. At length we deserted the bark *Florence* and some days afterward the bark *Three Brothers*, and our delivery was accomplished.

After meeting the *Three Brothers*, a part of the wrecked crews from the *Florence* was put on board the *Three Brothers*, and on the 24th got under way and set sail, the *Florence* for San Francisco, and the *Three Brothers* for Honolulu.

The fate of some men who went back to the ships cannot be positively told, but if they do not reach the land and live among the natives, a lingering death is certain, however distant it may be, as not a vestige of any of the ships that were abandoned in 1871, which were carried away by the ice, was ever seen afterwards, and judging by that, as these ships are in a much worse situation, having no defence against the ice, the probabilities are that they will be crushed by the ice, rudders torn off and they rendered totally unmanageable. If by any possibility they should drift out, they will go ashore, but it is our firm opinion they will never come out of the immense pack where they were left, as the whole pack moves together and they are frozen in solid, nothing but some extraordinary commotion among the ice with a good crew on board and ships free to work, could have brought them out before the abandonment; how much less chance, then, with none to manage them, we leave others to judge.

N. GARDNER, of Deadwood, reports that the Black Hills mining company's quartz mill commenced operation on the 16th inst. On the following day they ran through seven tons of ore from the Hidden Treasure lode, which cleaned up $5,000. Gulch mining is still in operation, and the quartz mines are showing better results every day.

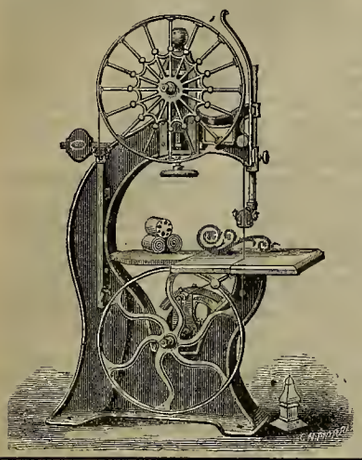
THE sales of stocks in the San Francisco Board during the first nine months of the present year show an aggregate value of $174,872,575, or over $11,000,000 more than for the like period in 1875; $20,000,000 more than for the same time in 1374, and $80,000,000 more than in 1873.

MR. E. G. GAERTNER has filed his bond and taken oath of office as U. S. Mineral Surveyor for Arizona.

PACIFIC MACHINERY DEPOT,

H. P. GREGORY & Co., Nos. 14 & 16 First Street,

P. O. Box 168. **San Francisco, Cal.**



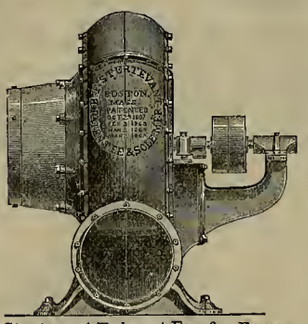
SOLE AGENT FOR THE PACIFIC COAST FOR

J. A. Fay & Co's Wood-working Machinery,

Blake's Patent Steam Pumps,

Tanite Co's Emery Wheels and Machinery,

Fitchburg Machine Co's Machinists' Tools,



Sturtevant Exhaust Fan for Removing Shavings and Sawdust from Machines.

Sturtevant's Blowers and Exhaust Fans,

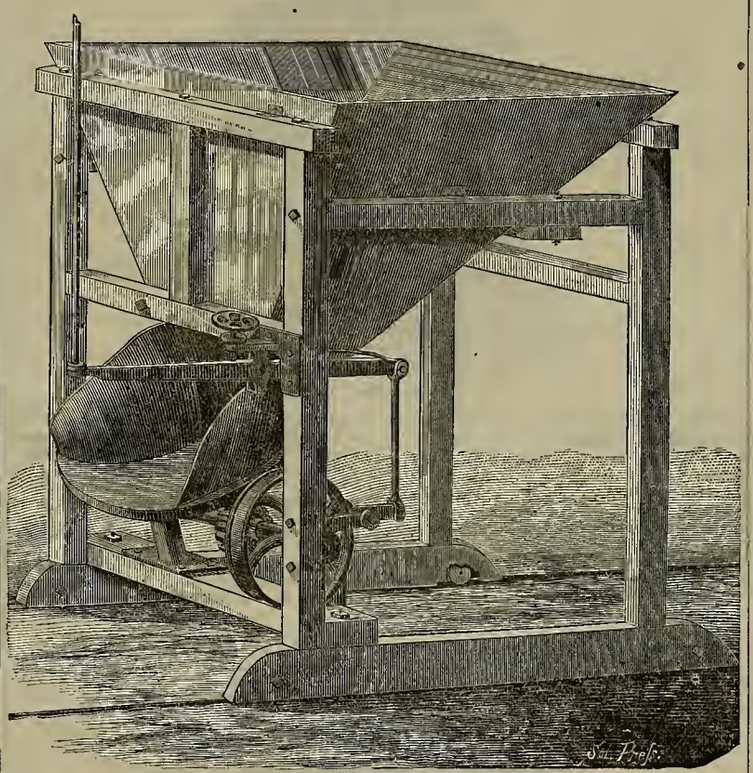
SEWING MACHINES.—We bave a first-clas machine we wisb to dispose of on favorsble terms. Apply at this office.

$1,000 CHALLENGE ORE FEEDER,

HENDY & COCHRANE'S PATENT,

AWARDED FIRST PREMIUM AT THE TENTH INDUSTRIAL FAIR OF THE MECHANICS' INSTITUTE.



It may be considered as now fully demonetrated, by careful snd long-continued experimentation, that tbe plan upon whicb a perfect ore feeder must be constructed is that of tbe *carrier*, and not tbat of the shaking table. Uniform snd accurate feeding is not possible upon the latter plan. The ore must be evenly carried, upon a steadily advancing plane, or table, to tbe line of discbsrge, and tbere simply *dropped* Spasmodic or jerky contrivances will not answer tbe pnrpoee.

REFERENCES.

A letter received from tbe Julian Mill, Newcastle, says, of tbe Table Feeder: "It is tbe most perfect Feeder we have ever seen; don't see how any mill can do without them."——A letter from Mr. C. C. Belding, of Amador County, speaks in the highest terms of tbem.——Two of tbe macbines were shipped to tbe Bunker Hill Mill, Amador County.—— Mr. Stevenson, of Boston Mill, Gold Hill, Nevada, saye tbey are tbe best Feeder he bss ever seen.——Mr. Lacbman, of the Soulsby Mill, Tuolumne County, says they work splendid; could not do better.——Two of tbe macbines were shipped to tbe California Company, Nevada City.——O. J. Garland, of Mosquito Gulch, Calaveras County, says: "I find them an excellent macbine."——S. D. B. Stewart, Supt. Lincoln Gold Mining Compsny, says they are a perfect success.——O. C. Hewitt, Supt. Keystone Mining Compsny, saye: "I csn safely recommend tbem to all millmen."

We warrsnt the macbines to give perfect satisfaction, and to be a better and more durable Feeder tban any otber in tbe market, and will sell them as cbeap as sny other macbine of its clase.

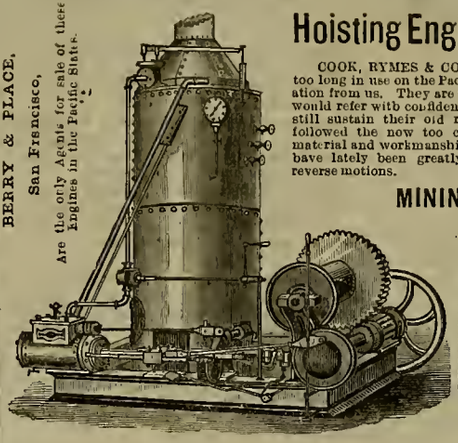
ANGELL'S CHARCOAL DENTAL SOAP for Whitening and Preserving the Teeth. J. W. ANGELL, Prop., San Francisco

---

BERRY & PLACE, San Francisco, Are the only Agents for sale of these Engines in the Pacific States.



Hoisting Engines. Mining Engines.

COOK, RYMES & CO.'S celebrated Hoisting Engines have been too long in use on the Pacific coast to require any special recommendation from us. They are well known from Alaska to Mexico. We would refer with confidence to any one of the hundreds in use. They still sustain their old reputation, the manufacturers not having followed the now too common practice of reducing the quality of material and workmanship to compete with cheaper engines. They have lately been greatly improved by adding large drums, and reverse motions.

MINING HOISTING ENGINES.

(Manufactured by the same parties.)

Our new Mining Engine is built from plans and specifications of several of our MOST SUCCESSFUL MINING ENGINEERS, and the result is the most complete

Double Drum Hoisting Engine

Ever built. Their advantages will be seen at a glance by any one familiar with the necessities of a mine. These engines may be seen in use in Ophir, Con. Virginia, Chollar, Europa, Niagara, Leviathan, Phil Sheridan, and several other mines on the Comstock Lode. For sale only at

BERRY & PLACE,

(Successors to Treadwell & Co.)

San Francisco Pioneer Screen Works,

J. W QUICK, MANUFACTURER,

32 Fremont Street, San Francisco.

Several first premiums received for quartz mill Screens, and perforated sheet metals of every description. I would call special attention to my SLOT CUT and SLOT PUNCHED SCREENS, which are attracting much attention and giving universal satisfaction. This is the only establishment on the coast devoted exclusively to the manufacture of Screens. Mill owners using battery Screens extensively can contract for large supplies at favorable rates. Orders solicited and promptly attended to.

(Continued from Page 286.)

EUREKA DISTRICT.

EUREKA CON.—Eureka *Sentinel*, Oct. 22: About 65 men are now employed at this mine. Work is being prosecuted mostly in the eighth and ninth levels, which, although not yielding at present sufficient ore to keep the furnaces running, present indications which justify the expectation, amounting almost to a certainty, that a large body of ore is near at hand.

THE FIRST DIVIDEND.—Capt. Taylor informs us that the proprietors of the Matamoras netted $14,000 in cold cash from the late short run of the new Matamoras furnace. This, he believes, is the finest dividend ever taken to Chicago from a mining venture, and it will doubtless have a tendency to place our camp in a favorable light before the speculative people of the Lake city. Messrs. Steele & Co. departed for Chicago much pleased with the prospects of the Matamoras.

JERSEY DISTRICT.

LOOKING WELL.—*Silver State*, Oct. 21: S. J. Chambers, who arrived yesterday with mail and express matter from Jersey, informs us that the mine is looking well and the new whim works like a charm. The shaft will now be sunk deeper and the mine developed to a greater extent. The prospects are bright and everybody is hopeful.

Arizona.

BULLION.—Arizona *Miner*, Oct. 13: On Saturday last, Mr. Pletz sent in his weekly shipment of Peck bullion, viz: 3 bars, aggregate value, $5,645.62. And on Wednesday, from Swilling's mine at Black canyon, one bar, weighing 1,479.15 ounces, 959 fine, worth $1,833.99. Making the aggregate shipment of silver during the week $7,479.61. This latter bar is the product of five and a half tons of ore sent from Black canyon as an experiment. This mine only runs five stamps on silver ore, and for want of pan capacity they are only run in the day time, while it takes the whole 24 hours for the two pans to work up what the five stamps crush in 12 hours. The other five stamps are at work on gold-bearing rock from various localities.

GLOBE DISTRICT.—Los Angeles *Herald*, Oct. 21: From Col. T. Burgess, who has just returned from a four months' stay in Arizona, we yesterday gathered some interesting information concerning the reported fabulous wealth of the Globe district. Although no shafts have thus far been sunk deeper than ten feet, much of the rock taken out assays away up in the thousands. The valley, which is some ten miles long by two or three in width, is dotted over with monuments of claims set up by silver hunters. Col. Burgess stated that full preparations for developing the ore were in progress when he left, on the 13th of September. A stamp mill had just been brought in by Morell & Ketchum, of Silver City, which is probably in operation, and another was to be erected by Magruder & Fresh, of Georgetown. Reducing works will also be erected by Messrs. Kennedy & Beebe. Our informant confirmed the story reported some time since, of a young man who came into the district and made some remarkable finds by means of a crooked stick or wand, in a manner similar to the old method of finding places to dig for water.

Colorado.

BULLION.—Colorado *Miner*, Oct. 14: The Judd & Crosby works shipped, since last report, $13,375.

QUEEN OF THE WEST.—The Silver Fountain tunnel has just cut the vein at a depth of 600 feet. No stoping has been done, and the tunnel will be pushed ahead rapidly.

SILVER CLANGE.—The lessees, Morseman & Co., have in their lower level, adjoining Gen. Gilbert's workings, six to eight feet in width of scattered ore, rich streaks permeating crevice material, all of which pays to save. Little sorting is required, and the boys can break down large amounts of ore at a small expense.

CENTENNIAL AWARDS.—Clear Creek county's exhibit has received much favorable mention from Centennial visitors, and thus far has obtained the following medals and awards: For silver and lead ores, Dives mine, Baxter mine, Pelican mine, Coldstream mine and Hercules and Roe mine. At the head of the list of machinery for treating ores, we notice the award to Stephen R. Krom, New York, dry ore concentrators in two models, and one in full size and jaw breaker.

Idaho.

THE EMPIRE.—Owyhee *Avalanche*, Oct. 21: Work is progressing very favorably in this mine, and in the vicinity of the main ledge where operations have been recently carried on the developments are of the most satisfactory character. A prosperous business for the Empire for the coming winter months may be set down as a fixed fact.

Oregon.

QUICKSILVER. — Jacksonville *Times*, Oct. 17: The Emeline quicksilver mining company have selected and packed out one and a half tons of 60 per cent. ore, which they propose shipping to Oakland, Douglas county, Oregon. This is probably the richest lot of quicksilver ore ever taken out of the mine. The company has no concentrating apparatus and this ore has been picked out by hand. They have about 60 tons of ore on their dump, which will yield at least 15 per cent. The company contemplate taking in retorts in the spring by the way of Klamath river, Siskiyou county, California.

Utah.

TINTIC NOTES.—Salt Lake *Tribune*, Oct. 21: Mr. Richard Gough, of Tintic, favored us with a pleasant call last evening. He brings favorable reports from his district of the mining interests there. Some 12 or 15 mines are taking out ore enough to pay expenses, and others are coining money. There are no idle men in the district, the weather is yet pleasant and business is generally good.

New Incorporations.

The following companies have filed certificates of incorporation in the County Clerk's office at San Francisco:

COVE M. CO.—October 23d. Location: California. Capital stock, $10,000,000. Directors—A. Blatchley, C. Hawley, T. Prince, F. McCann and John O'Drane.

LOMA LARGA M. CO.—October 22d. Location: California and Republic of Salvador, Central America. Capital stock, $12,000,000. Trustees—Edward L. G. Steele, Jose Maria Monteliegre, George A. Moore, Adolfo Urtosk and John Hewston.

PHŒNIX PETROLEUM CO.—October 25th. Object: To bore for petroleum oil in Los Angeles, Ventura and other counties of California. Capital stock, $5,000,000. Trustees—Dorville Libby, Z. E. Britton, Henry Kimball, T. F. Palmer, E. P. Gray, George S. Thurston and Joseph Pentecost.

Meetings and Elections.

LORD & ROBINSON M. CO.—Oct. 20th. Trustees: S. Heydenfeldt (President), Jas. Phelan (Vice President), J. G. Riley, D. B. Francis and W. B. Murdoch. H. S. Healy, Secretary.

COOK & GRAY M. CO.—Oct. 20th. Trustees: S. Heydenfeldt (President), Jas. Phelan (Vice President), J. G. Riley, D. B. Francis and W. B. Murdoch. H. S. Healy, Secretary.

PLUTUS G. & S. M. CO.—Oct. 20th. Wm. Jay Smith, President; Jno. Brunner, Vice President; H. A. M. Thee, Treasurer, and E. A. Peck, Secretary.

WASHOE WATER AND GRAVEL M. CO.—C. W. Carter, President; O. H. Nelson, Vice President; W. L. Ustick, Secretary, and Merchants' Exchange Bank, Treasurer.

PATENTS & INVENTIONS.

A Weekly List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

FOR WEEK ENDING OCTOBER 17TH, 1876.

SEWER TRAPS.—Thomas Gnerin, S. F.

BOTTLE AND CUP STOPPERS.—Carlton Newman, S. F.

EXCAVATOR AND DUMPING CARTS.—Jacob Price, San Leandro, Cal.

PLASTER CEILINGS, CORNICES, ETC.—Thomas P. Cleary, S. F.

PROCESS OF REFRIGERATION.—Robert H. Lucas, S. F.

WATER METERS.—Sebastian Plymale, Portland, Ogn.

——"The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Hendy's Ore Feeder.

The Hendy ore feeder, which we described in detail not long since, is being extensively introduced among the mills on this coast, and wherever used gives good satisfaction. The feeder is constructed in such a manner as to cause a perfect and uniform feeding of ore to the stamps. It is constructed on the plan of a carrier, and not that of a shaking table. The latter, it is claimed by some, does not feed regularly wet or dry, fine or coarse ores, and Mr. Hendy claims that the carrier table overcomes these objections.

Mr. Hendy's confidence in the superiority of his machine is expressed in the name he has given it. By the "$1,000 Challenge ore feeder" is meant that Mr. Hendy challenges all owners of ore feeders of any description whatever to a test trial for that or any other sum. The only conditions exacted are that the machines shall be subjected to every kind of rock, or whatever may come in contact in the general use of ore feeders, and that the decision shall be left to the judgment of disinterested mill owners; moreover, that the test shall be carried out at a quartz mill, and continued for a period of days or weeks. Concerning the controversy with Stanford—inventor of a feeder of that name—Mr. Hendy makes a statement to us substantially as follows: When Mr. Hendy invented his machine he used the adjustable lever invented by Stanford, thinking the latter's patent covered only a combination. On consultation, however, he found Stanford's claim to the adjustable lever to be valid. He accordingly purchased Stanford's patent outright for $3,000, giving him $2,950—$50 being discounted for cash. Then, owning the Stanford patent on the adjustable lever, he proceeded to manufacture the improved feeder. Not long after, however, he found that Stanford had another feeder, and was practically using the device the patent for which he had sold to Hendy, thereby being in the position of an infringer on his own patent. This is in substance the cause of the controversy which has been carried on in the newspapers. We should judge, however, that the proper place to settle any such dispute would be in the courts. Mr. Stanford, for reasons best known to himself, has, as will be seen by the advertisement of Mr. Hendy in another column, thus far declined to accept the challenge offered to him, and so the matter stands.

COST OF WORK IN MINES.—The following extract from the official letter of the superintendent of the Manhattan mine will give those not familiar with the subject an idea of the cost of running underground work: The following is a summary of the workings for the last week: Bowman incline—570 square feet were breasted on the Panamint, at a cost of 95 cents per square foot; 90 square feet on the S. Panamint, at a cost of $1 33 per foot; 250 square feet on the 500-foot level, at a cost of 30 cents per square foot. The cross-cut at the head of the double chute was run 10 feet, on day pay, at a cost of $4 per foot. West drift in incline No. 2, N. Panamint, was extended 11 feet, at a cost of $4.36 per foot; chute No. 2, N. Panamint, was raised 10 feet, at a cost of $4 80 per foot. The Paxton east drift was extended 14 feet, at a cost of $3 42 per foot. Parrish east drift was extended 4 feet, at a cost of $4 per foot—the above are all on day pay. The N. Panamint drift was carried forward on contract 14 feet since the 4th inst., at $5.90 per foot, netting contractors $2.95 per day. Frost shaft, 615 square feet were breasted on the Independence ledge, above the 370-foot level, at a cost of 80 cents per square foot. At the 500-foot level 620 feet were breasted, at a cost of 74 cents per foot. On 260-foot level, North Star ledge, 120 square feet were breasted, at a cost of $1.50 per foot. The 260 east drift was extended 6 feet, at a cost of $8 per foot; 375-foot east drift 12 feet, at $3.33 per foot; the 500-foot east drift 11 feet, at $8.72 per foot, all on day pay. The 300-foot cross cut was run 13 feet on contract at $7 per foot, netting contractors $9.10 per day. During the past week the 570-foot cross-cut was run 8 feet, on contract at $9 50 per foot, netting contractors $3.30 per day. The 517-foot cross-cut of the Curtis shaft was run 19 feet on day pay at a cost of $7.57 per foot.

WOODWARD'S GARDENS embraces an Aquarium, Museum, Art Gallery, Conservatories, Tropical Houses, Menagerie, Seal Ponds and Skating Rink.

General News Items.

A THREE days' battle last week resulted in a victory for the Turks.

GOVERNOR IRWIN has decided that an extra session of the legislature is not necessary.

THE fire in the Wellington mine, British Columbia, is reported extinguished. The damage is great.

THE French senate have voted 6,000,000 francs toward the construction of a building for a world's fair, to be held in Paris in 1878.

H. C. BENNETT, the defaulting pension agent, arrived here from Colorado on Saturday in charge of a deputy United States marshal.

WM. T. COLEMAN has been elected President of the Society of California Pioneers, vice James Lick, deceased.

A DISPATCH from Rome says all the cardinals residing abroad are expected there to discuss the important propositions offered by the congregations.

IT is announced that the British government intend to present St. George's house, at the Centennial grounds, to the city of Philadelphia at the close of the exhibition.

THE operative cotton spinners of Blackburn have decided to withdraw their notices, and practically the dispute in north and northwestern Lancashire, England, is at an end.

THE taxes of 1876–77 in this county are now payable. The rate is $2.12½, which is unusually high. After the first Monday in January 5 per cent. will be added on all taxes then unpaid.

THE engineers and firemen on the New Jersey Central railroad struck work at 12 o'clock Monday night. Wherever the trains happened to be the engineers dumped their fires, and the men left the engines.

REVENUE agent, Alvin B. Clark, on his arrival in Washington, and reporting to the department was discharged from the service by order of the President. The grounds for the dismissal are not made public.

A CHANGE is to be made in the office of Chief of the Detective Corps of the Treasury, the resignation of Elmer C. Washburne, the present head of that organization, having been requested.

DR. WILLIAM T. LUCKY, who died in this city on Saturday, was well known in educational circles in California, having been for a number of years principal of the State normal school, and latterly principal of the Los Angeles high school. His age was 55 years.

A DISPATCH received at the Merchants' Exchange yesterday morning reports that the steamer *Fidelitier* went ashore at Cuffey Cove on Tuesday. Her propeller shaft and foremast have been broken. The steamer *San Vicente* has sailed hence to render assistance.

THE residence of the late W. C. Ralston, at the corner of Pine and Leavenworth streets, it is said, has been leased to a New York firm for a term of years, and that it is the intention of the new lessees to refit it with furniture similar to that of the Palace hotel, and utilize it as a large boarding house.

THE sub-treasury in this city on Tuesday disbursed $45,000 in silver coin. The silver was not paid out in the redemption of greenbacks or fractional currency, but paid in part liquidation of checks against the Government. The amount of silver paid was 25 per cent. on each check.

A CALCUTTA dispatch to the *Times* states that the prospect for crops in Bombay becomes daily more gloomy. Seven districts, containing a population of nearly 6,000,000, are threatened with severe distress. The local government estimates that over 200,000 persons must be relieved in these districts alone. It is stated that the Monsoon crops have entirely failed, and the absence of rain prevents the collection of the rabbar and winter crops. The collector of Poonah reports that not a single blade of grass is visible for miles. Tanks and rivers are drying up and cattle dying from starvation. The collector at Singapore gives a still worse report. The government has opened relief works, and is employing people in excavating tanks and making roads.

THE Mackey & Fair tailings flume, to carry the slums from the Consolidated Virginia and California mills to the Ophir mill on the Carson river, will be eight miles long.

LONDON — Consols, 96⅛; Bonds, 102⅜

QUICKSILVER in S. F., by the flask, per ₰, 45.

Proof Positive of Paul's Process.

I hereby certify that I worked 228 tons of heavy sulphureted gold ore by Paul's dry process, which gave a yield of $15,373.71 ($67.42 per ton), and as high as 85 per cent. of assays. I do not hesitate to say that the process will produce, taking the average of California ores, from 80 to 90 per cent. by practical working.

CORTLAND WOON.

Thanks for Prompt Attention.

STOCKTON, June 26, 1875.

Messrs. Dewey & Co., S. F.:

I have received the patent for my invention in wagon brakes, which you prosecuted for me; patented May 11, 1875—No. 163,046. Thanks to you for your prompt attention to the case; you will hereafter be my attorneys in such cases. I recommend all inventors on the Pacific coast to give you a call, which I think they will never have any cause to regret. Very truly yours,

GEO. G. BUCKLAND,
Stockton, Cal.

DEWEY & CO.

U. S. and Foreign

Patent Agents,

No. 224 Sansome St.

SAN FRANCISCO.

To Inventors.

To secure the services of able, reliable and every way efficient attorneys to properly prepare and present the case of an applicaot for a patent at Washington, is an important item with those who have important inventions. It is not always that young inventors know just where to find such agents. Dewey & Co., the publishers of this paper, have been the leading patent solicitors in the United States west of the Mississippi for over twelve years past. Their specifications and principal business is done by able and experienced partners in the firm. They refer with pleasure to thousands of patentees for whom they have secured valued patents. Their pamphlet circular, containing hints and information to inventors, will be sent free on application at the office, No. 224 Sansome street, S. F.

The Scientific Press Engraving Company.

As has been announced in our columns, this company is prepared to do fine wood engraving on favorable terms. Mr. E. Schultze, managing partner, served a thorough tuition in his branch of art in Germany and New York, and has since had over seven years' experience in designing, drawing and engraving in California. Customers can place their orders in Mr. Schultze's hands with the full assurance of receiving satisfaction as to quality of work and fairness of price.

The Explorers', Miners' and Metallurgists' Companion.

Comprising a Practical Exposition of the Various Departments of Exploration, Mining, Engineering, Assaying, and Metallurgy,

Containing 672 Pages and 83 Engravings

BY J. S. PHILLIPS, M. E.,

Of California, a Practical Operator for Thirty-four Years; Explorer, and Resident in the Pacific States and Territories for the past Eight Years.

PRICE, bound in cloth, $10.50; in leather, $12. Forwarded by mail for 50c. extra, at the MINING AND SCIENTIFIC PRESS Office, by

DEWEY & CO.

The Large Circulation of the MINING AND SCIENTIFIC PRESS extends throughout the mining districts of California, Nevada, Utah, Colorado, Arizona, Idaho, Montana, British Columbia and to other parts of North and South America. Established in 1860, it has long been the leading Mining Journal of the Contioent, its varied and reliable contents giving it a character popular with both its reading and advertising patrons.

SANTA CLARA, CAL., April 6th, 1875.

MESSRS. DEWEY & CO.—*Gents:*—We have just received Patent No. 160,545, for J. T. Watkins & Co's Mammoth Road Grader, which was patented through your Agency. It is the neatest and best that we have ever received. We feel proud of it and thankful to you for the care and attention that you have given it, and when we have anything to do in that line of business we will surely give you a call. Very respectfully,

J. T. WATKINS & Co.

WOODLAND, CAL., Aug. 8th, 1876.

MESSRS. DEWEY & CO.—*Gents:* Your letter containing the patent for my Centennial churn has come duly to hand, and you will please accept my many thanks for the prompt manner in which you attended to the business intrusted to your care, and I will take great pleasure in recommending you to any one having anything to attend to in your line. I am having a number of the churns put up, which will be ready for sale in a few weeks. Yours truly, JAMES ROOT.

MESSRS. DEWEY & CO., San Francisco:—Please find enclosed post-office order, for which please send MINING AND SCIENTIFIC PRESS. I have been a close reader of the PRESS for three years, and regard it as the foremost mining periodical in the Union. I am glad to notice the circulation of the PRESS is increasing here and is highly prized by our best mining men. H. P. Central City, Colorado.

GOOD PRINTING INK.—We prefer Chas. Eneu Johnson's printing inks, having need them on this paper for the past four years. H. S. Crocker & Co., printers, stationers, blank book and paper dealers, are Johnson's S. F. agents.—DEWEY & Co., Publishers.

Scientific and Practical Books on Mining, Metallurgy, Etc.

Published or issued, wholesale and retail, by DEWEY & CO., MINING AND SCIENTIFIC PRESS Office, S. F.

BY CUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST.

Roasting of Gold and Silver Ores, and the Extraction of their Respective Metals without Quicksilver. 1870.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus.

It is a work of great merit, by an author whose reputation is unsurpassed in his specialty.

Price $2.50 coin, or $3 currency, postage free.

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arsenlurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequaled by any other published, embracing the subjects treated. Its authority is highly steemed and regarded by its readers; containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE REDUCED TO $5.

IMPROVED.—Dewey & Co., publishers of the MINING AND SCIENTIFIC PRESS and the RURAL PRESS, now have the leaves of both these sixteen page sheets cut and stitched, which is an improvement that all readers of that otherwise inconvenient form of journal will appreciate very much. Every farmer would be a gainer were he to subscribe for the RURAL. It is decidedly a valuable paper, and the SCIENTIFIC PRESS is no less so to mining men.—Inyo Independent.

$1,000 CHALLENGE ORE FEEDER.

Backward in coming forward—C. P. Stanford fails to come to time on the challenge of $1,000 to test the merits of his ore feeder as against mine. The challenge is still open to him or any one else. Gentlemen, put up or shut up. JOSHUA HENDY,

49 and 51 Fremont street.

Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

Office Cascade Blue Gravel Mining Company—NOTICE:—A meeting of the stockholders of the Cascade Blue Gravel Mining Company will be held at the office of the company, 311 California street, rooms 3 and 4, second floor, San Francisco, Cal., on Monday, November 20th, 1876, at two o'clock P. M., for the purpose of disposing of the company's stock, and authorizing the sale of the entire property of the company, with any other business that may come before said company. R. F. KNOX, President,

J. M. BUFFINGTON, Secretary.

San Francisco, Oct. 13th, 1876.

Eagle Quicksilver Mining Co.—Location of works Santa Barbara county, Cal. Principal place of business, San Francisco, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 30th day of September, 1876, an assessment (No. 9) of two hundred and fifty ($250) dollars per share was levied upon all the shares of said company, payable immediately, in gold coin of the United States, to the Secretary, at his office, rooms 5 & 6, No. 302 Montgomery street, San Francisco, Cal.

Any shares upon which said assessment shall remain unpaid on Wednesday, the 25th day of November, 18 6, shall be deemed delinquent, and will be duly advertised on Saturday, the second day of December, 1876, for sale at public auction, and unless payment shall be made before, will be sold on Monday, the fourth day of December, 1876, as provided by the articles of agreement of said company, to pay the delinquent assessment, together with cost of advertising and expense of sale. By order of Board of Trustees. WM. H. WATSON, Secretary.

Mariposa Land and Mining Company of California. Location of principal place of business, San Francisco, Cal. Location of works, Mariposa County, Cal.

NOTICE.—There are delinquent upon the following described stock, on account of assessment (No. 7), levied on the seventh day of September, 1876, the several amounts set opposite the names of the respective shareholders, as follows:

Machinery.

The Ingersoll Rock-Drill

Is Extensively Used in the East and

TAKES THE PLACE OF ALL OTHERS,

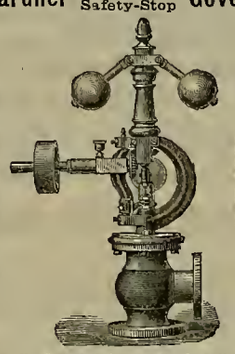
Wherever introduced, because it can be run with less power, labor and repairs, and do more work than any other Drill in the market. It has but few parts, is easily handled, being light, and HAS AUTOMATIC FEED, which saves labor. WE ASK FOR TRIAL AGAINST ANY COMPETITOR. For particular information regarding Drills or Air Compressors, send for circular to

J. B. REYNOLDS,

426 California Street

The Gardner Automatic Safety-Stop Governor.

MORE THAN TEN THOUSAND NOW IN USE. EVERY ONE WARRANTED.



SEND FOR DESCRIPTIVE CIRCULAR AND PRICE LIST.

☞ When all others fail, buy a "Gardner." We have all sizes of these celebrated Steam Governors on hand at all times.

BERRY & PLACE,

Selling Agents for Pacific States,

Cor. Market & Fremont Sts., S. F.

THE O'HARRA

CHLORIDIZING FURNACE.

Guaranteed to Chloridize from 85 to 95 per cent. of any gold or silver ores that are not more profitable for smelting. Will also desulphurize ores and put them in proper shape for working in cupola furnaces.

Cost of Roasting and Chloridizing by this Process:

Two cords of wood at $6	$12.00
Two firemen at $4	8.00
1500 lbs of salt at 1½c	22.50
Wear of shoes and power	1.50
Cost for 15 tons	$44.00
Cost for one ton	2.93⅓

In a furnace of three or four times this capacity the cost is decreased by 20 per cent.

The furnace is now working successfully at the Poe Consolidated Co.'s mines, in the Peavine District. For further information, apply to

D. J. O'HARRA,

Reno, Nevada.

THE

LANE & BODLEY COMPANY,

John & Water Sts., Cincinnati, O.,

Sole Manufacturers of

BRUCKNER'S PATENT

REVOLVING FURNACE,

For Chloridizing, Desulphurizing and Roasting Ores.

—ALSO—

STEAM ENGINES, SAWMILLS, SHAFTING, GEARING AND MINING MACHINERY.

☞ Send for our illustrated catalogue.

Diamond Drill Co.

The undersigned, owners of LESCHOT'S PATENT for DIAMOND-POINTED DRILLS, now brought to the highest state of perfection, are prepared to fill orders for the IMPROVED PROSPECTING and TUNNELING DRILLS, with or without power, at short notice, and at reduced prices. Abundant testimony furnished of the great economy and successful working of numerous machines in operation in the quartz and gravel mines on this coast. Circulars forwarded, and full information given upon application.

721 Market Street, S. F.

JAMES' SINGLE TRACK RAILWAY.

This is the best and cheapest style of railroad in the world. It can be made and kept in repair for less than the cost of a county road. It can overcome any grade, and make any curve. Can be run on wood or iron (wood the best). It places railroads within the reach of any village. Can be used to great advantage in transporting coal, ore, gravel, rock, lumber, or any class of freight. Any company or persons desiring a cheap and safe railroad will do well to correspond with

DAVID B. JAMES, Visalia, Tulare Co., Cal.

THOS. PRICE'S

Assay Office and Chemical Laboratory,

524 Sacramento Street, S. F.

Deposits of bullion received, melted into bars, and returns made in from 24 to 48 hours.

Bullion can be forwarded to this Office from any part of the interior by Express, and returns made in the same manner.

Careful Analyses made of Ores, Metals, Soils, Waters, Industrial Products, Etc. Mines examined and reported upon. Consultations on Chemical and Metallurgical questions.

WHOsoever desires profitable employment **WILL** find that there is nothing by which they **CAN** as easily earn a livelihood and **MAKE** themselves ussful, (for certainly **MONEY** is not the only object of life,) as by canvassing for "Lights and Shades in San Francisco." A Good Agent is wanted for every town on the Coast. Address immediately,

Pub. "Lights and Shades in S. F."

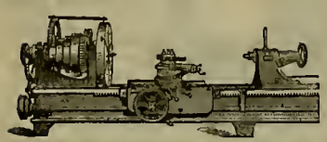
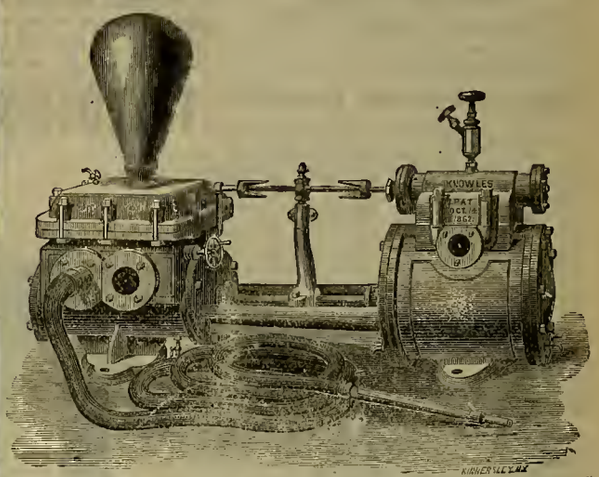
Lathes, Planes, and Machinists' Tools.



FERRIS & MILES'
Steam Hammers.



Knowles' Steam Pump; for all purposes where Pumping is required.

THE BUCKMINSTER ROCK DRILL.

The Most Efficient Rock Drill in the Market.

LIGHT, STRONG and DURABLE.

No External Machinery Liable to Injury from Rough Usage, as all the Working Parts are Enclosed in the Cylinder and Valve Chest.

A TRUE SMOOTH HOLE EVERY TIME. THE MOST ECONOMICAL DRILL YET MADE.

THE WORKING PARTS OF THE DRILL ARE FEW AND SIMPLE IN ARRANGEMENT, SO THERE IS NO LIABILITY OF INJURY. THE CLAMPS FOR HOLDING THE DRILL ON THE TRIPOD, FOR HOLDING THE DRILL TOOL IN POSITION, AND FOR FIXING THE WEIGHTS ON THE LEGS OF TRIPOD ARE ALL IMPROVED AND VERY E FECTIVE.

The device for rotating this Drill has few parts, and can not get out of order. There is no chance for wear. The motion is positive, and never fails of action. The Drill Carriage can be turned clear round the column, and can also turn in a complete circle on the head of the clamp.

All parts subject to wear are of the Best Cast Steel, and all made to gauge and interchangeable.

This is the Lightest and Strongest Rock Drill yet invented. Being nearly all Cast Steel, it is easily handled and moved, as all superfluous metal is dispensed with.

We also call the attention of those interested to the Horizontal Air Compressor furnished with the Buckminster Drill when desired. It is Economical, Light, Easily Run and conveniently portable.

We claim that the Buckminster Drill will do as good work as any in the market, at a much less expenditure of power, and a great decrease in first cost of machinery. Drills made all the usual sizes.

Mining Companies Desiring Rock Drilling Machinery should Examine this Drill and Air Compressor, and we are confident that it will give satisfaction. Address,

PICKERING ENGINE GOVERNOR.

Vallejo Foundry, October 17th, 1876.

MESSRS. NEYLAN & YOUNG, San Francisco,

Agents "Pickering Governors."

Gents:—The 10 two-inch Improved Speed Adjusting Governors I bought of you this year for my Patent Straw Burning Threshing Engines give splendid satisfaction. They far surpass for regularity of speed any Governor that I have ever seen, and I have seen all of the best kinds; I have seen the main belt fly off the pulley several times this season while threshing, and the engineer did not discover it, so perfectly was the speed maintained, until he was told of it; this I consider something wonderful; I consider the Governor absolutely perfect, so far as speed is concerned. I bought, and put on to one of my engines a Shive Governor, to see which was the best, and after one season's trial I have no hesitation in saying they are as far superior to the Shive, or any other Governor that I have seen or used, as the Shive Governor is to the old Butterfly Valve Governor. I wish you would send me the lowest price that you can furnish 25 Governors for next season's engines.

Yours, respectfully, I. L. HEALD.

PAUL'S DRY PROCESS.

I am now prepared to test gold and silver milling ores in any quantity from FIVE POUNDS to FIFTY TONS and assert my ability to prove, by machinery NOW UP, and open to public inspection, and by practical testing of its merits, that I can increase the yield of gold mills, working wet batteries and copper plates, from FIFTY to ONE HUNDRED PER CENT, and on silver ores a much larger percentage than by pan amalgamation, and at less expense than any known method of working quartz well; and from some "gold' ores of California can extract more silver extra with the gold, which is now lost, than all the expenses of mining and milling. Having had 25 years' practical experience in milling gold and silver ores, I presume to know whereof I speak, and AM PREPARED TO PROVE ALL I ASSERT. These mills, for simplicity, cheapness, practicability and perfection in working, challenge the skill of the age to surpass. Quartz miners who desire to investigate and have their ore tested, are invited to a critical examination of the machinery and process, and can receive permits for examination, particulars and pamphlets explaining process by calling at my office. ALMARIN B. PAUL.

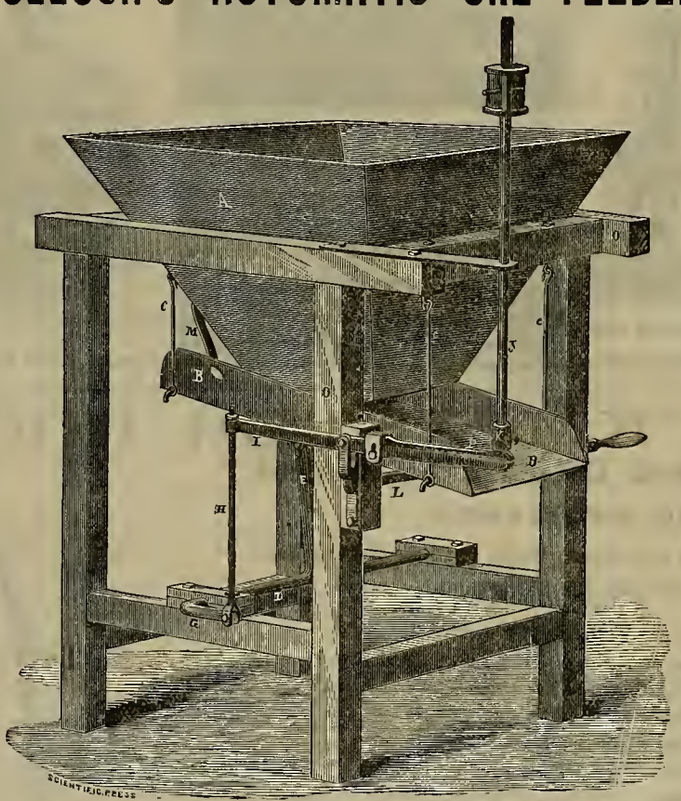
TULLOCH'S AUTOMATIC ORE FEEDER.



The TULLOCH AUTOMATIC ORE FEEDERS have been practically tested during the last year and a half in 40 mills, of from five to 80 stamps each, and have, in every case, given perfect satisfaction. The Tulloch machine is so constructed that the drop of the stamp feeds the ore in just such quantities as the stamps require. Each drop regulates the supply required for the next drop, whether it be more or less, and this is the true principle of an automatic feeder. The tray moves longitudinally, and a stationary scraper forces the material forward at each backward movement of the tray, thus insuring the perfect feeding of all classes of ore, whether it be dry or wet.

We append a few extracts from the many testimonials which we have received from mill men and practical mining men, of the effectiveness and positive action of the Tulloch Feeder. We do not depend solely upon these testimonials, as we are aware that testimonials are easily secured for almost any machine, but the high character of the parties certifying to those herewith given, will establish their value and genuineness:

Mr. Jas. G. Fair has 28 in use; says: I regard them superior to any Feeder with which I am acquainted; I consider no mill perfect without them. Mr. E. R. Burke, Sumner mine, Kern county, has 16: They never get tired; no man living can feed a battery as well; they save us in labor alone $48 a day. Mr. Green, of the Phœnix mill (12), Amador, writes: The first machine we had is working away; is as good as ever; have not spent a dime on it; in use 14 months; you need fear no competition on wet ores. Mr. W. H. Armstrong, of Consolidated Virginia mill: We are running 60 stamps with your Feeders; they give unbounded satisfaction; they have not cost the company one dollar since starting up. Mr. H. C. Bidwell, Supt. Green Mountain and Gold Stripe companies, Plumas county, writes: From the start they have done splendidly; no trouble whatever; requiring but little attention; a boy can manage them; the saving in both labor and castings is fully one-half over the old style of feeding by hand. Mr. Preston writes: I have four of your Automatic Self Feeders, and my mill men each and all say they are the best they have ever used. They are an improvement on all I have ever seen, being simple in construction, and good for either wet or dry crushing; refer to over 40 mills using them; they are guaranteed to give perfect satisfaction. Send for circulars.

F. OGDEN, 417 Market Street, S. F.

PLANO, CAL., December 3, 1875.

MESSRS. DEWEY & CO.—Gentlemen: It affords me the greatest pleasure to bear testimony to the merits of your most excellent paper, the PACIFIC RURAL PRESS, which I consider the very best produced on this Coast, if not in the United States, for a journal of general intelligence for the people. DR. F. A. JOHNSTON.

THOUGHTLESSNESS.—Persons sometimes return their paper, marked "stop this paper." Their name being pasted on the sheet they think that is all we need to be able to cross their names off. Now that is thoughtlessness. Your P. O. address is needed as much as your name. We have thousands of names arranged only according to locality. Our mailing clerk does not know where everybody lives.

VOLUME XXXIII. Number 19.

Improved Hand Fire Engine and Hose Carriage.

In the accompanying engrevings we illnstrate an improved hend fire engine and hose carriage combined, which has been especielly constructed with a view to meeting the reqnirements of towns and villages and isolnted factories which do not afford the facilities of steam or the advanteges to he derived from a system of waterworks. Hand engines, as nsnally oonstrncted, reqnire a large gang of men to operate them, making them comparatively nseless in loealities where 40 to 50 men cannot he assemhled at a moment's notice.

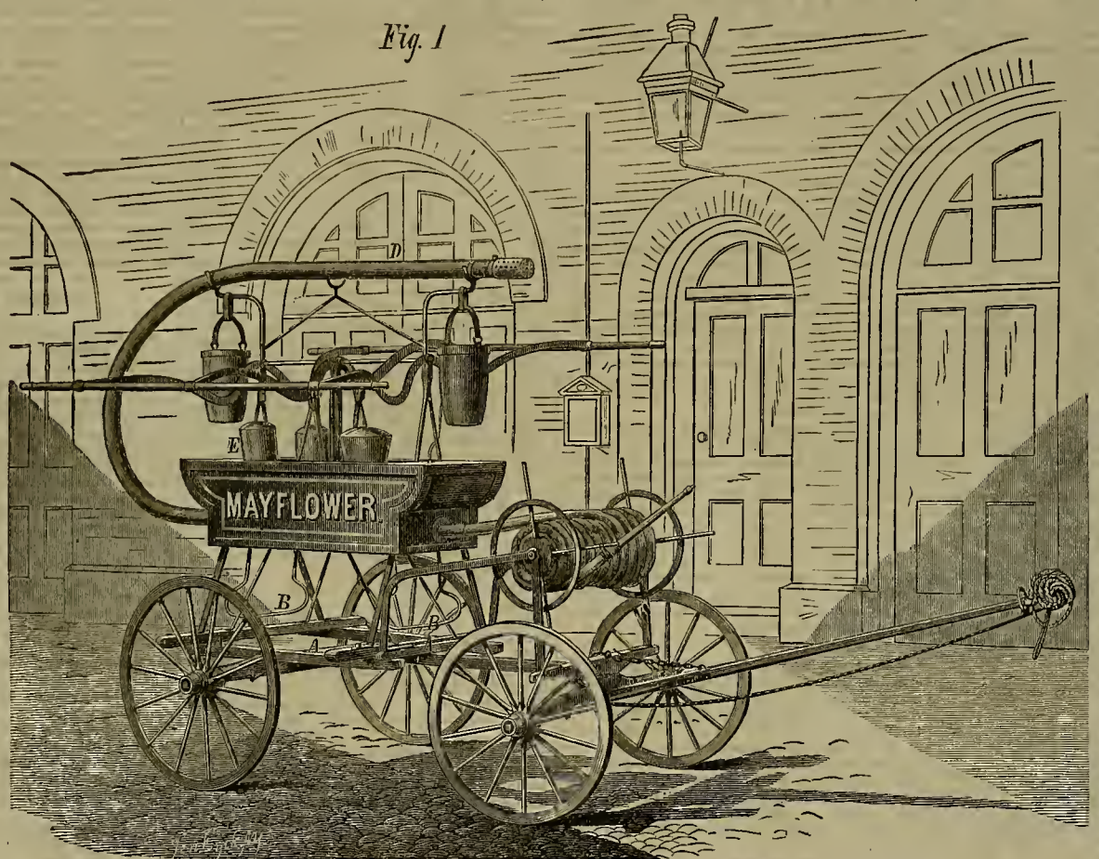
The engine herewith represented, we are informed, can be operated by from two to fourteen men, according to the amount of water and the dis'ance the stream has to be thrown. Two men can readily draw it over all common grades. At present the mennfactnrers are building one size only, the entire eqnipment weighing only 500 ponnds, the hose reel having capecity for 800 feet of one and and a half inch hose.

In readiness for fire, the engine is always mounted on the carriage, as shown in Fig. 1, while Fig. 2 shows the engine as detached from the hose cerriage, with leading hose run ont. Upon an alarm of fire being given, the first man or two at the engine house starts for the scene of ection with the mechine. Upon arrival the engine is disconneoted from the carriege or hose reel hy simply turning three clamp fingers, which drop into loops, at *A*. Two men then lift the engine from the carriage, it weighing alone only 325 pounds, by the hendles, *B*, setting it upon its own ways, *C*, as shown in Fig. 2, leeving the hose carriage reedy to nnreel the hose. The hose being always conpled to the engine, no time is lost, as the first sweep of the brakes, after the snction, *D*, is dropped into the weter, starts the stream. The engine is so light that it cen he lifted and set over a well, cistern or reservoir. It really needs no priming, although a priming hucket is provided at *E*, leading by e stop-cock into the pipe running from the suction to the cylinder. This wonld prove advantageons shonld the valves, throngh non-use, become dry. The engine has, of course, two cylinders, the diameter of each being fonr inches, the throw heing six inches, thus giving a powerful stroke, the brakes moving throngh a circle of two feet nine inches.

Both air chamber and water chamber are copper, and the valves are composition. The hind wheels are 36 inches high, the forward ones being 32 inches, and the latter swing under the reel, allowing the machine to be turned in its own length. Twelve feet of two and a half inch suction hose are provided, with which are used one and a helf inch leading hose with half inch nozzle.

We are informed thet with 14 men the mechine hes thrown e half inch stream 156 feet horizontally, drawing water perpendicularly 12 feet, and discharging throngh 100 feet of hose. This range of stream is, as will he seen, snfficient to cover an ordinary factory, warehouse, or dwelling, enabling fires on roofs to be extinguished by the mechine stationed on the ground outside.

Fig. 1



HALL HAND FIRE ENGINE AND HOSE CARRIAGE.

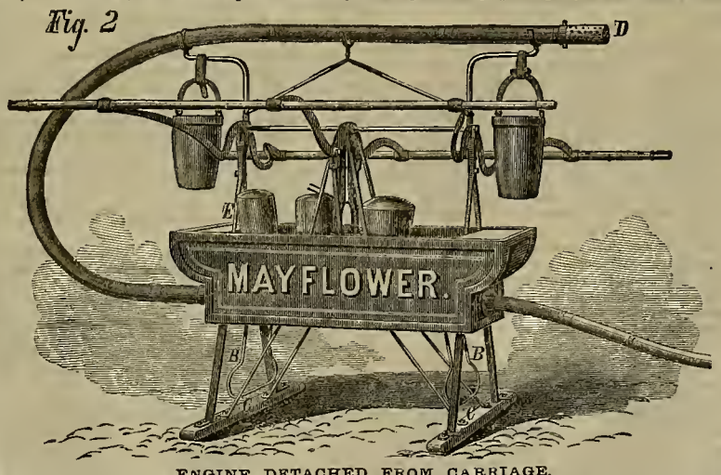
The makers furnish the epperatns with 12 feet of snotion hose, hrass strainer, draw rope, spanners for suction and leading hose couplings, two fire buckets, oil osn, eto. The complete machine, in readiness for the npplication of leading hose, is sold for $350 at their mennfactory. The inventor is A. M. Hell, Malden, Mass., end the mennfecturers are S. C. Forsaith & Co., Manchester, N. H.

A man employed by the Spring Valley company at Cherokee, was hlown np and instantly killed on the 24th of October. It seems he went to the magazine while the men were at dinner to get a certridge, end while there the explosion took place, instantly killing him.

A sad accident occurred at Hite's Cove, on the 20th instant. An Italien, named Giobaptista Munsente, employed at the Hite mine, was attending to the drum at the opening of the shaft in the 125-foot level, and in sn ungnerded moment he was hy some meens caught and drewn into the drum and crnshed to death. When discovered there were 40 coils of rope wound around him.—*Mariposa Gazette.*

It has been reported that a quicksilver mine in Napa county, principally, if not altog ther owned by the residents of Walnut Creek and vicinity, has been sold to an English company for a handsome round sum, which will give eech of the shareholders a moderate fortnne.

Fig. 2



ENGINE DETACHED FROM CARRIAGE.

Paul's Dry Process.

In enother column will be fonnd an advertisement in reference to this process, and from Mr. Paul's declaretions we shonld think it well for our quertz miners to investigete the merits of this redical chenge in the working of gold end silver ores. This process bas been before the public for years, bnt not in its present perfected form, although the principles involved ere the same, viz.: dry and fine pnlverization and dry amalgamation. The whole thing now being perfected hy several new petents, procured throngh the Mining and Scientific Press patent agenoy, Mr. Peul has built and is now running in this city e complete mill on a practical scele, whioh will setisfy the most skeptical, either one way or another, as to its value or nselessness.

Thet Mr Paul is giving satisfaction is best evinced by the mills already built snd now building, the last being for Oregon. This is a ten-stamp battery with everything in the most complete style and after the most approved plans. This mill was for the Lncky Qneen mining compeny, and is the most perfect mill of its style and size on the coest. The whole operetion is antomatio and will reqnire bnt two men to menage it. The perfect working of onr ores, whereby from 85 to 95 per cent. of the metel can be extracted cheaply, as Mr. Paul claims to do with his process, certainly must make the mining interest the most profitable of any brench of indns-try on the Pacific Coast.

The prinoiple set forth hy Mr. Paul, that to secnre a proper percentage the ores mnst be worked dry, is agreed to by many who have investigeted the snbject closely. Now that Mr. Paul has bnilt a mill in this city on a scale which must be accepted as practical, its merits can be accurately tested by those who desire it, whether believers in the principle or not. He is now in a position to work ore by the ton, and those whose ore is worked may personally snperintend the whole operation and judge of its efficiency. Mr. Peul is confident that he can work ore muoh more cheaply than it is at present done, and et the same time do it more effectively. Persons desirons of having ore worked or testing the process, may address Mr. Paul or come to the city with their ore.

The Lick Estate.—In the Probate Court Mr. Hall McAllister, attorney for John H. Lick, has filed a petition in the matter of the estate of the lats James Lick, setting forth the facts of his death; that he died intestate, leaving surving no wife, and that the petitioner is the only son and sole heir of the deceased; that he is now 58 yeers of age; that the deceased left valuable property in the oity and oonnty of San Francisco of a valne nnknown to the petitioner; thet the petitioner is willing to act as the Administrator of the estate of the decedent. He therefore asks that the letters of edministretion be issned to him npon the estate of the late James Lick, deceased. This is the first step in the litigation which will ensue over the property of the lete James Lick.

Silver bullion was quoted in London Wednesday at 53¼d per onnce.

Pacific Coast Railroad Notes.

The Reno *Gazette* says that a project for building a prismoidal railroad direct from Reno to Virginia is now nnder consideration hy certain partiea who have the energy and mesns to successfully carry it ont. It is thought that the farmers along the line from Reno to the foot of the Geiger grade, would, for a small cousideration, grant the right of way, and from there the road would go via Lonise creek into Virgiaia. To construct such a road would only require $2,700 per mile, exclusive of rolling stock, etc., so that altogether not over $75,000 wonld be required to build and stock it. A prismoida 60 miles iu length is now in operation in West Virginia and works satisfactorily. Seth Martin and others of Truckee are about to build one from Truckee to Martin's mill, a distance of 14 miles, which will ultimately be extended into Sierra valley. It is the mill men in and around Truckee who are agitating such a road from Reno to Virginia. They claim that they cannot now compete with Yerington, Bliss & Co., of Carson, for the lumber trede of Virginia. But a prismoidal rosd would enable them to land their lumber, timber, etc., so that a ready market would be fonnd for all they saw. The enterprise is likely to assume shape soon, and we hope the projeot will be pushed throngh.

The gross earnings of the Central Pacific railroad company for September and for the first nine months of the year are thus reported:

	September.	Nine Months.
1874	$1,371,700	$10,305,200
1875	1,567,600	12,567,000
1876	1,886,000	13,143,200

The business of the road has been steadily increasing ever sinoe its oompletion, in 1868. This is true with reference to both local and through traffic, partionlarly the former. The through business is divided with the Union Pacific and other roads, and is not always of a profitable character, though no freight is carried without some remuneration. It is the local busiuess, however, that pays the best.

Last week the Board of Directors of the Sonoma and Marin reilroad company formally transferred their franchise and property to Col. Peter Donahue, of the San Francisco and North Paoific railroad. The terms of the sale are that Col. Donahue is to pay the Sonoma and Marin railroad $85,000, the amount already expended; this amount to be paid in coin, and the transfer to take place to-day, upon the surrender of their stock by the stookholders, or else the stockholders will be allowed stock in the San Francisco and North Pacific railroad to the amount of their subscriptions. The purchaser is to pay in coin for all outlays made by the Sonoma and Marin railroad company; to assume all existing contracts, and to carry them ont in good faith. The road from Petaluma to Sau Rafael is to be bnilt and completed on the present line of snrvey by the 1st of May next, or as near thereto as can be accomplished. While substantially maintaining the present line of survey of said road, Col. Donahue may vary and modify the same in unimportant and minor points, where so advised by his engineer. An early train is to be run between Petaluma and San Francisco, not later than 7 A. M. daily, and one train between San Francisco and Petaluma as late as 4 P. M. He also agrees to exonerate and release all subscribers and stockholders upon the assignment and surrender of their respective subscriptions and stock, from all liability and responsibility as snch snbscribers and stockholders.

The completion of the North Pacific Coast (narrow gauge) railroad, from Saucelito to the Russian river, which will soon be effected, will havo the effect of opening up one of the largest available bodies of redwood timber in California—timber of the very finest quality. A. D. Moore, President of the railroad company and copartner of John Gawne, of Stockton, owns a tract of 10,000 acres of timber land on Knowles' creek, near Russian river, and has organized a corporation called the New Tyrone mill company, which has built extensive mills that will be in operation in abont 20 days. The Stockton *Independent* announoes that estimates based on a recent survey of the lands of this mill compauy indicate that there are at least 500,000,000 feet of lumber thereon to be cut. With this quantity made readily available there need be no immediate fears of a lack of supply of this valuable timber. The trees in this region are of a very large size, those measnring 45 feet in circumference at the base being frequently met with.

The highest trestle bridge on the Pacific coast is the one in course of construction aoross Brown canyon, two miles northwest of Freestone, on the line of the North Pacific Coast railroad. It will be 135 feet in hight from the bed of the oenyon, and 600 feet in length.

The *Foothill Tidings* of Grass Valley aays: Oar little narrow gauge began running to this place on the 17th of April last, and to Nevada City on the 22d of May. An official statement of the receipts and running expenses to September 30th givea the following pleaaant exhibit to stockholders: Receipts for five months, $45,397.90; expenses for aame length of time, $20,977.40; balanoe of receipts over expenses, $24,420.50, being equivalent to $53,505.68 per annum; less interest on $325,000 bonds, at eight per oent. per annum, $26,000; leaving a balance of $27,695.68 per aunum for a sinking fund for a final redemption of the honds and distribution to the stockholders, not estimatiag the increase of traffio reasonably expected from the natnral increase in the businesa and popnlation of the district.

Parties from the line of the railroad inform the Visalia *Delta* that the construction outfit of the Southern Pacific railroad has been sent to Goshen and Delti, prepsratory to laying the road from the former place toward the lake. Five hnudred Chinamen and abont forty heavy teams, with camp equipage, ties, rails and other stock, sre lodged along the railroad preparatory to immediate nction.

An extract from a letter written by a prominent gentleman of Oregon says: Things look more favorable for railroad oonnection between Umatilla and Ogden, or Sioux City. The Oregon Pacific railroad, combining with the O. S. N. Co., and I hear capitalists of Portland and San Francisoo, propose to take hold of it, and push the enterprise to a successful conclusion.

Advices from Victoria, B. C., state that the Bntte inlet party of railway surveyors is jnst in. They report an extremely favorable route for the Canadian Pacific road by that inlet. Three parties are now surveying the canyone of Fraser river. They have abont one month'e work ahead, at the conclasion of which the surveya will be definitely closed and the route proclaimed.

There is prospect of the Isthmus Transit railway being built from Utter City to Coqnille next summer. California capitalists have advanced $6,000 toward the surveys.

Another Big Shaft on the Comstock.

When it is taken into consideration, says the Gold Hill *News*, that the permanent dip of the Comstock is to the east, that the experience of the past has demonstrated the necessity of deep mining, and that work through inclines is alwaya prosecuted at a great disadvantage and with considerable loss of power, aside from that expended on the increase of distance, the reason for the general movement of hoisting works to the east will at once become apparent. The Yellow Jacket has at last joined in the general movement in that direction and arranged for the privilege of sinking an eastern shaft.

This arrangement has been effected with the North Chipman mining company, the locatiou of which is a little south of the Europa and east of the Yellow Jacket and Crown Point. The North Chipman lies at the east end of the tunnel east of Fort Homestead, and the looation is in every respect desirable for the purpose of sinking a large permaneut shaft for prospecting and working purposes, like that of the Chollar-Norcross-Savage shaft company. It has the additional advantage of being directly on the main track of the Virginia & Trackee railrosd, so that supplies of timber, lumber, wood, etc., can be delivered at once where wanted.

The North Chipman company have already a three-compartment shaft sunk on their ground 100 feet. This is to be enlarged to the requisite size for deep and extensive operations, and csrried ou down. The work will be conducted on a grand scale, and will be pnshed ahead with the greatest energy. It is not inteuded to discontinue operations from the old shaft of the Jacket. The work of development will go on in the seme manner as is being done in Consolidated Virginia and the C. & C. shaft, where the new and old workiugs are of about equal use and importance.

The Paris Exposition.—From the offi iel circulars just published by the French government, we extract the following regulations for the coming exhibition at Paris in 1878: "All foreign commissious constituted at the request of the French government are invited to correspond with the Commissioner General. In each section devoted to the exhibits of the same nation the objects exposed are divided into nine groups, as follows: First, works of art. Second, education, instructiou, material and processes of the liberal arts. Third, farniture and its accessories. Fourth, silks, cloths, etc., raw material and manufactured. Fifth, industrial products. Sixth, nseful results of mechanical industry. Seventh, alimentary products. Eighth, agriculture. Ninth, horticulture. A special hall is devoted to retrospective and ethnological exhibits. French or foreign exhibitors will he furnished with space free of cost.

The Silver Commission.—The Uuited States Monetary Commission is now organized as follows: Senators John P. Jones, of Nevada; Geo. S. Boutwell, of Massachusetts; Lewis V. Bogy, of Missouri; Representatives R. L. Gibson, of Louisiana; Richard P. Bland, of Missouri; George Millard, of Michigan; Hon. William S. Groesbeck, of Cincinnati; Prof. Francis Border, of Cambridge, expert; Alex. Delmar, of Philadelphia, Statistician and Corresponding Secretary; George M. Weston, of Boston, Recording Secretary. The Commission is now in session in New York, taking evidence. A Snb-Committee will shortly start for this coast to take evidence with regard to the prodnction of the precioua metala in Califoruia, Nevada, etc., and in reference to other matters intrusted by Congress to the Commission.

Dueing the last two years profeasional duck hunters have bired the lakea in the vicinity of Sacramento for the hunting aeaaon, and prevented amateura from shooting thereon. In some instances thoy made money by the transaction, but aa a general thing did not. The result promises to be that the competition for the possession of the best shooting grounds will cause the rent to become so high that the hnnters will not bave as large incomes as they did before they begau renting.

Tuscarora District.

A oorrespondent of the Elko *Independent* says: The Tusosrora mining district bids fair to be *the* mining distriot outside of Virginia. On my arrival in Tuscarora I was taken in charge hy Messrs. Raines, McNally, O'Briter and McCain of the Hornet, Young America, Grand Prize, Young America South aud Ophir, who courteously showed me over the mines and vied with each other in showing me all that could nossibly be seen. The district lies on a rising slope from Independence valley, and conld he driven over with a team at neerly all points. It hes more the appearance of prairie land, and a miner would as soon look over a plowed field for oroppings as to look over the district for them. And it is owing to their absence that the district has been simply known as a placer gold oamp.

The Young America company first obtained a ledge bearing gold with some silver, and even after that was discovered some years elapsed before another ledge was found. About 14 months ago Colonel De Frees, while on a trip to Cornucopie, stopped at Tascarora and was taken by the appearance of the camp, went out prospecting, and noticing some float rock on what was called Porphyry hill, sunk for the ledge and strack it. The peculiarity of the ore puzzled him and others, and they tried it in a forge, and found that it readily blistered, showing silver at all points. They then had assays made which ruu np into the hundreds, and snrprised the best miners. Prospectors flocked in, and one discovery quickly followed nuother, till to-day Tuscarora has a brighter prospect then White Pine had. Its ledges are well-defined, walls regular, and are beyond doubt true fissure veins. The Hornet, Young America and De Frees ledges run a little east of north and west of south, with a westerly dip. The Convia ledge, upon which is situated the Grand Prize and the Graud Deposit, hoth run a little north of east and sonth of west, having also a westerly dip. The walls in all cases are well-defined, composed of granite and sienite, and csrry down without a break. The ledges vary from four to six feet. The pay streak runs from six iaches to the full width of vein.

The writer saw many places in the De Frees, Grand Deposit, Hornet and Buckeye where it showed over five feet of ore. There is not a ledge struck in the distriot that does not show horn silver, it appearing within two feet of the surface, and the formation of the ooutry is such that large ore bodies mnst certainly be discovered. It is only a question of time. The Grand Prize, De Frees, Hornet and Young Amerioa are evideuce of this view. There are many miues that lack capital to open them to fully demonstrate their thorough merit. The Young America and Grand Prize have both erected hoisting works and are under the superintendence of thoroughly competent men. The former are putting in timbers in their working shaft and preparing for the winter, having already laid in their wood. The Grand Prize is sinking a working shaft in a thorough manner (being a double compartment one).

The De Frees will put a donkey engine in their tunnel, carry their shaft down 150 feet from their lower level and run a drift north expecting to strike a heavy body of ore, it showing rich in the north drift of the second level. The ledges all carry heavy clay selvages, and where the ore body pinches out are easily traced. The camp is a lively one, and discoveries are constantly being recorded, the hardy prospectors making time count. The roads are in good oondition and the probabilities are, will be nntil the first of December.

The elevation of the camp is about 7,800 feet above the sea level, and the Tuscarora moantains are about 1,100 feet above it. The ascent ia gradual, trees and croppings discernable at a few points only. Ledges are being fonnd two miles west on the slope and parallel with Tuscarora. The ore carries gold, silver, pyrites of iron and manganese; is free milling ore, easily worked and mined. Below the water level no doubt sulphuret ores will be fonnd.

Wood is $10 per cord delivered, and sage brnsh $5 per load; water plenty.

The Hornet, of which E. P. Raines, Frank Hamilton and Judge Berry ere the ownere, is sacking rock which goes up in the hundrede. The gentlemen contemplate erecting within 90 daye a 10-etamp mill. Mr. Raines is busily engaged grading for the foundation and driving the work with a will. There is plenty of work awaitiug them, being fully exposed from the De Frees, Youug America, Grand Prize and other mines, 2,000 tons of ore. The Grand Prize continnes its shipment of the 100 tona spoken of hefore.

The camp is well worth a viait, and should be examined closely and critically; any one doing so can form but one opinion as to its prospects.

Pontoons.—The *Railway Age* saya: "The device of pontoon bridges, now so snccessfully in operation on the Mississippi, will prove a very great help to railway building. It removes the objectiona urged with force against the obstruction of navigable streams by fixed bridges with massive piers, against which boats are liable to be wrecked, and affords a cheap and unobjectionable method of crossiug rivers by wagon and foot passage as well as hy rail. So ekill continues to vanquish the obstacles in the way of the free and speedy communication of distaut regions with each other.

Holcomb and Bear Valley Mines.

Oar friend, Mr. George O. Tiffany, who has returned from a tour among the mines of the Bear Valley, Holcomb and adjacent mountains, informs ns that the Gold Hill mine, which has been closed for some time, is now about oommencing operations on an extensive soale. Engineers and workmen from San Francisco arrived and commenced putting the 40-stamp mill in repair on the 23d inst., under the charge of Mr. McMasters, a well known mining expert. The town of Gold Hill, situated 7,100 feet above the ocean level, was a thriving camp, employing three or four hundred men, when the mill oeased operating. In a few days the town was deserted. Now the influx is enlivening the streets, and the busy hum of the machinery of a mining camp in prosperous condition is again heard. A new stamp mill is on the ground, in the Ord district, under the superintendence of Mr. Whitlatch. The Lone Valley mines are being prospected extensively, and the Blue lead, owned and worked by Messrs. Bicknell, Tiffany, Cox and others, is in a promising oondition. This lead has been opened 150 feet in depth and 30 feet on the ledge, at right angles, and is a true fissure vein. We understand that it is the intention of the company to ountinue their work. Altogether, the mining prospects in that region are promising. The Holcomb valley mines, which are situated 8,250 feet above the sea level, have been extensively worked in former times as placer mines. Within the last three years large sums of money have been expended in the Holcomb valley mines, and the latest and most approved maohinery has been introduced. Mr. John Haley, of this oity, in oonnection with a company of London capitalists, has expended over $100,000 in prospecting and erecting machinery in Holcomb valley, and over $2,000,000 in placer and quartz gold have been taken from an area of about 100 acres. Work is at present suspended in the mills here, in consequeace of the near approach of winter, which commences early at this great elevation, and snow falls six feet deep on a level, thus interrupting miniug operations. Altogether the prospect is most promising for the next year, and our city will reap substantial benefits from that source.—*Los Angeles Express.*

A Queer Discovery.

For some years the existenoe of a large deposit of micaceous iron, east of the east fork of the Hassayampa, some 16 or 18 miles south of Prescott, has been known, and assays of it have been made from time to time, but nothing more valuable than iron discovered until one day last week, when a Mexican came to town and sold to Wm. M. Buffum some 15 ounces of silver bullion, which he afterwards seid he extracted from seven pounds of this ore, samples of which he showed. An assay was made by Blake of the samples brought in, which gave $447.10 in silver and $715.79 in gold. Wand and Saffenberg, with the Mexican, went to the mine on Thursday, and brought in some of the ore. Kelly made an assey of it, and found no trace of any metal but iron. Blake tried another piece and obtained $1,541.99 in silver and $25 11 in gold, aggregatiug $1,567.10. Martiu Saffenberg, on Monday, again went to the mine and selected a sample himself, with which the Mexican had nothing to do. This he brought in, and Kelly made an assay of it, and fonnd $1,410.32 in silver and $108.76 in gold, aggregating $1,579.08. Blake then assayed a piece taken from a very large chunk, brought in by Wand & Saffenberg, and found $680.18 in silver and $12 54 in gold; another gave only $3.14 in silver and only traces of gold.

No one at all acqnainted with the brittle iron ore, as it is called in California and Nevada, would ever suspect this to contain anything but iron and mica. Some have called it plumbago, from the fact that it is quite black and shines with a bright metallic luster. It is easily pulverized, and when rubbed in the hands has the appearance of being mixed with oil. For this reason many have given it the name of stove-blacking, which it very much resembles. Altogether it is a curious discovery, and puzzles the asseyers and experts, who are unable to tell any more about it than those who make no pretensions. It may be that an entirely new mineral has been discovered.—*Arizona Miner.*

South Comstock.—The Gold Hill *News* says: Work was resumed on this old established mine last Monday, under new and favorable auapices. Situated as it is upon the main Gold canyon section of the Comstock, just above Devil's Gate, and in the immediate vicinity of the Silver Hill Justice, Lady Washington and other prominent mines of that locality, its prospects and future should be just as good as the rest. A shaft has been sunk to the depth of 300 feet, and from it a drift was run away to the westward, cutting a large width of very promising vein matter, but no paying ore was found. Water coming in too freely to contend with to any advantage, work was suspended last April. Since then the water has subsided, owing doubtless to the assisting drainage of other mines, and the company having recaperated their strength, now propose seeing the thing out. Mr. J. C. Lennon has been appointed superintendent, and commenced the active discharge of his duties on Monday. He is having the boiler, engine and other works overhauled and in a day or two will begin readiness to start up. It is proposed to hoist out the water, sink the shaft a hundred feet or more deeper.

MECHANICAL PROGRESS.

Points on Incrustation.

A short examination, given by J. F. Ronan in *Iron*, of the various remedies against incrustation which have been proposed, will not be uninteresting, although it results in the conviction that most of them are unsatisfactory.

Sal ammonia, proposed by Ritterbrandt, and hydrochloric acid, are both open to the objections that their preventive action is only partial, and that they have the power of seriously injuring the boilers and connections.

Crude pyroligneous acid has been suggested for action upon carbonates alone, while petroleum has been extensively used in the United States with a measure of success, not only in preventing incrustations, but also in removing those already formed. Its action has not as yet been investigated, as far as I am aware, but it is probable that its effects are due to the decomposition of hydrocarbons. This seems to be borne out by a report by the chief engineer to the steam boiler and inspection company of Hartford, United States, who states that "petroleum works better where sulphate of lime predominates than in waters impregnated with carbonate of lime. We would not," he says, "advise it in connection with this latter." This simple fact renders it useless in the majority of boilers using fresh water in this country.

Oxalate of soda and tannate of soda were proposed by Dr. Rogers in America, in order to form, by decomposition of the lime salts, insoluble oxalates and tannates; but these would seem to increase the amount of solid matter precipitated, and, although proposed some years ago, to have been little used.

Lime and zinc have been used with some degree of success, but their action is confined to combining with the carbonic acid of the bicarbonats of lime. On sulphate of lime they have no action.

The object in view in the proposed use of starchy and gelatinous matters has been to prevent scale forming, by enveloping the precipitated or crystallized solids with gelatinous covering, and so to delay their settling by diminishing their weight. But M. Bidard's observations on the effects of the presence of organic matters (especially in so-called "anti incrustators," or compounds for preventing incrustation) at once sweeps the field of all remedies of an organic composition, proving them to be injurious by doing the very thing which they are supposed to prevent.

Soap acts upon both carbonate and sulphate of lime, but the quantity appears to be increased by the formation of lime soap, and thus the boiler is made filthy; a corrosive crust is sometimes formed, and priming and other evils also result from its use.

Recently a substance called "Burfitt's composition" has been patented for the prevention of boiler incrustation, but it has been found to consist essentially of organic matters, and, moreover, has rather increased than prevented incrustation where it has been used.

Two other methods of prevention have also been devised, and seem to be founded upon the fact which Prof. Mills informs me was first observed by J. Y. Buchanan, that barium chloride decomposes sulphates and liberates the carbonic acid in water.

One of these, called "De Haen's process," which consists in the use of barium chloride and milk of lime, is now extensively used in Austria and in Krupp's works in Prussia. A recently published statement of the comparative costs of working on this system, and with water containing gypsum, without an added re-agent, shows that to purify 33 cubic meters of water, when containing five parts gypsum in 100,000, the cost is 6d., and when containing 30 parts gypsum the cost is 3s. Practical working with this process for 12 months with one or two boilers showed an increase of expenditure of 500 florins, against which was to be placed the saving in fuel resulting from absence of incrustation, and reduced repairs from the same cause.

The analysis of deposits which have been found to accumulate in the steam pipes, etc., where these processes have been used, impress me with the idea that these methods are, however, open to serious objections in practical working on account of the formation of salts of barium.

There is, however, one system of working which has yet to stand its trial, but which it is perhaps not extravagant to consider as inseparably connected with the advancement of engineering science and appliances upon which alone it depends. That is the working of land boilers in connection with surface condensers, and so supplying them with pure water.

COST OF STEEL RAILS.—The *Railway Age* says: We notice the recent sale of 500 tons of steel rails by the Harrisburg (Pa.) mills, at the extraordinary low price of $36 a ton. Steel rails also are now at their lowest figure, a sale of 10,000 tons for the Southern Pacific being reported at $49, at the mills, while in 1867 the price was $172, and in 1873, when the trouble began, it was $120. Considering these figures, and the corresponding reduction in the cost of grading, locomotives, cars, buildings, etc., now is evidently the time for anybody who wants a railroad to build it—unless he prefers to get it cheaper yet by buying one in, ready made, at a foreclosure.

To Secure Perfect Round Bars.

It is not necessary to say anything about the importance to the millwright, engineer or machine-maker, of having his round iron really round, and, what is of equal or even greater importance, straight; nor is it necessary to speak of the difficulty the iron-maker experiences in endeavoring to supply to the user such an article. In spite of all the care and skill that can be exercised in the rolling mill, the ordinary round bar leaves it as a somewhat imperfect and but approximate cylinder, neither truly round nor truly straight.

Mr. Edmund Butler, in an essay published in *Iron*, gives the following points of English progress toward securing perfect bars: It is a comparatively easy matter to straighten a bar which is heat in one uniform curve from end to end, but it is the short bends, crooks, or "dog-legs," which are the main difficulty, the presence or absence of which makes a bad or good round bar; and these which appear to be more or less inevitable in all rolling, can only be effectually removed while the bars are still hot, for with cold straightening there is always a tendency in the bars to revert to their original form when the skin is removed in the lathe. The production of a machine to accomplish the desiderata now in question has long occupied the attention and taxed the ingenuity of the ironmaster, particularly for the larger sizes, and many schemes have been initiated and tried, but the machine now under notice is the only one known to the writer which effectually removes "dog-legs," and produces round bars sufficiently straight to be used for most ordinary purposes without being turned in the lathe.

The original idea of which this machine is the embodiment is due to Mr. J. Robertson, of Glasgow, though the same idea seems to have occurred almost simultaneously to Mr. G. W. Dyson, of Sheffield, and it is the general arrangement of the latter which has been adopted, though, since it passed out of the hands of these gentlemen, many improvements and additions—the results of practice and experience—have been made, which have given it the success it has now attained.

The bars are passed while still hot from the rolls between two revolving discs having bevelled faces, which, when brought together so as to compress the bars between them with the degree of force thought necessary, rotate them, and, at the same time, traverse them forwards, also by a mechanical arrangement backwards, so that the whole length of the bar is acted on by one continuous movement, and the bars come out straightened and planished. In doing this, moreover, two other important results are produced, the most palpable of which is that the scale, instead of being rolled in, as might be supposed, is entirely removed and the surface is made smooth.

The skin is brought to a very high degree of cleanness and smoothness, so much so that a mere rubbing with emery cloth, or if the bar be put into the lathe, with emery stick, polishes it as though it had been turned and polished in the ordinary manner. In some small samples on exhibit, one end is left blue, as from the machine, and the other end is polished as just described, in order to show the inappreciable difference in diameter between the two portions. This is already done practically, and shafting is now running which has been put up without being turned, while other shafting, after being put up in the same manner, has been polished in its place; and, again, the bars have been put into the latter and finished with the file and emery stick without being turned. To carry the finishing process still further, if the bars, after being allowed to go cold, are passed again through the machine several times, the blue skin disappears, and the bars come out actually bright.

NEW STEAM NAVVY.—Messrs. Alexander Chaplin & Co., of Cranston Hill, Glasgow, are now exhibiting a steam excavator intended for use in the cuttings of railways and other similar operations. The machine, though powerful in its action, is simple in construction. On one end of a strong malleable iron frame mounted on wheels, are placed an upright boiler and double engine which drives a large drum, with groovee for receiving the main chain of the crane, which latter is supported on the other end of the frame. The main chain raises up and works a counterchaft, which, by means of pitch wheels and another chain, sets in motion a friction brake and the necessary gearing. These together set in action a powerful arm connected with the digger or bucket, driving it into the soil. On the necessary hight being attained, the crane is slowed either to right or left until the bucket is over the wagons intended to remove the earth. A trigger is then drawn, the bottom of the bucket falls out, and the load is deposited in the wagon. On lowering, the bottom relocks itself by automatic action. It is claimed for the machine that it results in great economy of labor, as it can perform the work of 80 men and needs only two to manage it.

LARGE PLATE OF CAST STEEL.—There has been rolled at the Black Diamond steel works a plate of cast steel of the following dimensions: 28 feet long, 42 inches wide by three-quarters of an inch in thickness, weighing 3,075 pounds. The plate was a very perfect one, and was rolled from the ingot to the dimensions named on one heat. It has been sent to the Centennial.

ENGLISH AND AMERICAN LATHE WORK.—The correspondent of an English paper at the Centennial says: The process of turning is different in England and America. In some kinds of work it would be the same, but generally the cut taken here is much less. A light cut and high speed seems to be the plan followed, and the result, all things considered, seems to justify the method when applied to practice here. Round iron or steel to two and a half inch diameter is turned "on one-sixteenth of an inch," as it is called—that is, the finishing and rolling dimeters have only this difference. Standard dimensions for shafts, and we may add for all turned work in most engineering shops, is by odd sixteenths, instead of by eighths as with us, and there is no doubt much gained, besides a saving of material, by working on such close dimensions.

SCIENTIFIC PROGRESS.

A New Earthquake Theory.

F. G. Fairfield in the *Phrenological Journal* notes that the recent observations of an Italian scientist, that the number of earth-tremors per year in southern Europe ranges as high 5,500, and the occurrence of such tremors may always be foretold by the barometer, seem likely to lead to important consequences as concerns the existing theory of volcanic action, and particularly as respects the intermittent activity of volcanoes. It has been demonstrated long since, in so far as anything not observationally verifiable can be, that the degree of internal heat, augmenting foot by foot according to the calculated rate, that must obtain at the earth's center, would, under the existing doctrines of geology, be sufficient to convert all known solids in bodies so explosive that a crust 1,000 miles in thickness would present little more obstacle to their violent expansion than a sheet of paper; and yet volcanoes have been dwelt upon as in some vague manner evidencing a molten state of the earth's interior. The possibility of accounting for volcanic action on the principal of atmospheric pressure had not, previous to the important discovery of a definite relation between earth-tremors (comparatively imperceptible earthquake waves) and the barometer, occurred to scientific men. The leading points of such a view, as it seems likely to supersede the existing one in the immediate future, may be briefly mapped out. By making a topographical outline of the surface of any of the existing continents transverse to its mountain ranges, the reader will readily see that the pressure of the atmosphere is exercised at an angle from the lowest point in the slope to the top of the range, in such a manner as to press the two ribs of the slope, not uniformly toward the earth's center, but inward toward each other; while, as one ascends toward the top, the density of the atmosphere and its pressure rapidly diminish. For example, the angle of pressure as respects the Andes range is a constantly shifting one from the Atlantic coast of Brazil on the one hand, and from the Pacific coast on the other. This angle may be ascertained at any point by drawing a line (or supposing one to be drawn) perpendicular to the plane of pressure at that point. The actual force with which the sloping sides of the Andes range are thus pressed downward and inward toward each other for hundreds of miles, while, owing to diminished density of the air, the pressure at the top is comparatively small, may be readily calculated. A heavy mass of snow on the sloping sides of the roof of a New England farm-house in winter, furnishes, on a small scale, no inapt illustration of the nature of the problem under consideration; and the yearly sag of such a roof, if the rafters happen to be weak, with its inward inclination on each side, tells exactly at what point the pressure is strongest. Now, as all these lines of atmospheric pressure, drawn perpendicular to the planes of the two mountain sides, meet beneath the mountain itself, the reader will be able to see very readily that, whether volcanic or not, every mountain is the seat of an almost inconceivable heat-generating force. This force, however, is not incalculable, but may be readily ascertained with mathematical exactness. An idea of its vastness may be obtained by simply considering that the atmospheric pressure of the whole continent of South America is practically concentrated along the line of the Andes range. These considerations explain why it is that earth-tremors usually travel toward, not from mountain ranges.

ON MOLECULES.—Different surfaces of the same crystal have a different solubility. This is one of a number of facts that have an interesting bearing on the mechanical theory of heat, as M. Pfanndle has shown in a recent paper to the Vienna academy. The growth of certain parts of a solid in a liquid, at the cost of others, without the liquid being supersaturated or the temperature varied; the transformation of powdered iodine into large crystals, when surrounded by its vapors (at constant temperature); the gradual crystalizing of solid amorphous bodies, etc., may all be included, he says, in one general view—that of the struggle for existence among molecules. Darwin's principle holds good in the world of molecules. Those forms (combinations) are preserved which have the most favorable conditions of existence. If the latter change, so do the former. Those chemical compounds tend to be preserved which are united by the strongest affinity. But here, also, the right of the stronger does not always obtain. Just as in the animal world certain forms are preserved because they have the power of escape or concealment, so in chemical processes, spite of stronger affinities, those products are often preserved which, by reason of their volatility, escape decomposition, or those which can withdraw out of the region of colliding molecules and entrench themselves in crystals.

Science in England and France.

At a late meeting of the French association for the advancement of science, M. Dumas, the president, made the following points on science in France and England: "In 1851 I was present in London at the first exhibition, and I soon found that among my fellow members of the different juries, the great number and importance of the French articles exhibited in the industrial arts were soon acknowledged, especially in those which depend upon science. England had the largest chemical works in the world, and there was no lack of able, practical men. But France had long possessed schools like the Ecole Polytechnique and the Ecole Normale, affording the highest class of chemical instruction, and whose pupils, in their after life, imparted to the various manufacturing works the benefit of the lesson taught at them. A very eminent English juror acknowledged the superiority in the following terms: 'England has erred so far in doing too little for science, which is money; henceforth let us follow the example set us by France.' Similar also was the expressed opinion of one of the English juries—that on the silken and other fabrics of Lyons. This fact once acknowledged, and there rose at once schools of science and art throughout the British Isles. There exists in that country a body—the British association for the advancement of science—always in the van, leading and guiding the efforts of science. To us, with its lengthened existence of nigh half a century, it affords a model. Under its auspices has English science assumed and preserved its high position. It contains among its members not merely the men of science, but also those bearing noble names long known and respected throughout the land, many of whom, together with the late Prince Consort, it has placed upon the list of its presidents. The British association at its very commencement marked out for itself its course, which it has unhesitatingly and unremittingly followed ever since—to stimulate, without in the slightest degree interfering with existing institutions, in all parts, the efforts of the votaries of science, to urge on and aid the efforts of individual research. One striking contrast exists between the world of science in France and in England. In the latter, until of late years at least, all the universities end important seats of learning were away from the capital, while in France all science centered in Paris, the provincial schools and universities being deemed but of secondary importance. To remedy this, to extend the domain of science and to restore to the provinces some of their ancient scientific eminence, is one of the objects of the French association for the advancement of science. France must not forget that science is a great power, and that its effects are visible in every branch of social and domestic life. When the Revolution of 1792 isolated us from the rest of Europe, and left us at once destitute of all those external products on which we had so much depended, it was to our men of science that we looked to remedy these wants, and persons of such eminence as Lavoisier, Berthelet and Chaptal labored with their own hands to fill the void. To science are due those terrible engines of war, and like-wise the steem engine, which has peaceably revolutionized all our manufacturing and our domestic life. Science also it is that causes the noisome tar, the refuse of our gas works, to afford us some of our brilliant dyes and some of our most delicate perfumes, and shows that in the production of a stearine candle there also lies a substance so terrific in its effects as is nitroglycerine. Science follows us everywhere, whether we like it or not. It must be our companion, to possess it or be possessed by it. If ignorant of it we are its slaves, if learned it obeys us."

LUNGE'S PROCESS OF MAKING SPONGY IRON.—Spongy iron for the precipitation of copper is prepared by Lunge from the residual products of pyrites extraction. These are heated in masses of 1,016 kilos., mixed with 305 kilos. of coal, in a reverberatory furnace, the heated gases of which first pass over the charge, and return to heat the hearth indirectly from below. The furnace is made in three sections, in the first of which the mixture remains from nine to twelve hours, in the second 18, and in the third 24. The end of the reduction is tested by dropping a titrated solution of sulphate of copper on one gramme of sample, stirring, and noticing how much of the solution is exhausted by the iron, taking a drop out from time to time and testing for copper with a polished knife-blade. The product is passed through tubes closed against the air into receivers having accurate fitting covers, allowed to cool for 24 hours, ground, and sifted. The copper solution is set in motion by a Korting's blast on addition of the pulverized iron.

OTHER COMPANIES—NOT ON THE LISTS OF THE BOARDS.

Atlantic Con M Co	Nev	1 25	O

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

ALPINE.

Barnes' Mine.—Alpine *Chronicle*, Oct. 21: Edward Barnes, of Petaluma, owner of the old Rogers claim in Hope valley, lately arrived at the mine with supplies, with the intention of starting up work immediately. Several companies are being organized in San Francisco for the purpose of working mines in the vicinity of the Barnes claim, and we predict lively times in mining affairs in that district next summer.

Jumping.—Jumping of mining claims and timber ranches is the order of the day in Alpine county. In some cases such practices are sanctioned by public opinion as right, but there are too many instances where parties are carrying on the business for the purpose of being bought off. A wholesome lesson in court might check indiscriminate jumping.

Heavy Storm.—A heavy rain storm set in on the morning of Tuesday last and continued, accompanied by a heavy gale, during the whole of Tuesday night and until about 9 A. M. on Wednesday. The storm, notwithstanding its severity, did no particular damage in this vicinity.

The Lady Franklin.—This shaft is down 50 feet. Sinking has ceased for the present, in order to grade a site for a building to be erected immediately over the shaft. At the above depth the prospects are very flattering.

Struck It.—Alpine *Chronicle*, Oct. 28: We hear that the ledge has been struck in the 400-ft level of the Exchequer mine, and it is said to be as large and rich.

The Advance.—The pump recently placed in the lower level not working satisfactorily, a new one has been ordered from San Francisco.

The Lady Franklin.—Having finished grading, superintendent Meagher has commenced the erection of a building for the hoisting works. The sinking of the shaft will be prosecuted with energy through the winter.

Frame Up.—The frame of the new mill for the I X L company is up—except the engine room addition. The stormy weather this week has interfered with work very much. To-day the boilers being placed in position.

AMADOR.

Another Tunneling Venture at Volcano.—Amador *Ledger*, Oct 28: In our last issue we gave an item about the tunnel of the Volcano gold gravel company, to tap the Volcano basin and enable it to be worked with hydraulics. This week the Moyle company has also started work upon their tunnel, intended to accomplish the same result. It is not at all probable that both enterprises will be prosecuted to completion. Indeed, if one of them ever gets through it will exceed the expectations of many. There is little doubt that considerable gold yet remains in the basin, sufficient perhaps to pay for the cost of the tunnel, and leave a handsome profit besides. The Moyle tunnel will not be so costly an undertaking as the other. The distance to be tunneled is not so great, neither will it drain the basin to so great a depth. Between the rivalry of the two companies, we hope to see one of them reach the goal, and reap an abundant harvest of gold for their labor and expense.

Horrible Calamity.—Amador *Dispatch*, Oct. 28: Last Sunday morning about half past seven o'clock, four men working in a shaft at the Oneida mine started up out of the shaft, and when they were about 70 feet up, the rope broke above the ground and let the men fall back, and about 1,000 feet of rope covered them. Two of the men—Messrs. John Troovoich and James Forshey—were inside the bucket and fortunately were not killed, but were very seriously hurt. The other two men—Messrs. John Ludemann and John Gardner—were outside the bucket and were killed—the latter being terribly mutilated and instantly killed—the former not dying until he was brought out of the shaft. They were not brought out until about ten o'clock. The hoisting rope rusted in the mine was old and rotten and could almost be picked to pieces with the fingers, and there is no doubt but that it was the gross negligence of the company that caused this very sad affair.

BUTTE.

Skippea Gold Mining Company.—Oroville *Mercury*, Oct 27: Work has again started up on the Skipper mine, near Dogtown. The company intend to erect a 10-stamp mill on the property, with all the new patent appliances for saving gold and sulphurets. Two automatic self-feeders will supply the battery with rock, and two Schofield concentrators will be put in to save sulphurets. Mr. Mathis, the superintendent of the new company and one-quarter interest owner in the mine, has accomplished considerable in procuring capital to invest in quartz while times are so dull. The company have satisfied themselves that the mine is good, the ledge a large one. And from the showing made by a four-stamp mill, which Mr. Mathis has been running on the rock for the last nine months, they think they have an excellent property. And if the 10-stamp mill proves as they anticipate, 20 more stamps will be added. There is a chance for work for some good men at the mine, who understand working in quartz. Five carpenters began work on Sunday last, getting out lumber for the new mill building, and everything will be pushed to a speedy completion.

Ditch Hill Mines.—Cummings hill is again in high favor with the stockholders of these diggings. Last summer the lead was lost, and despite the many efforts made to find it, failed to yield any return to the owners. But once again all is serene, and good pay dirt is being taken out of the main tunnel and occasionally handsome nuggets are found. Last week we heard of one carload of dirt paying $140. This is a good mine and merits the confidence felt in it by the gentlemen who advanced the money necessary to open it up. In the immediate vicinity are the Carriboo, Providence Hill and Sunnyside claims, all of which ought to return large profits to their owners.

INYO.

Shut Down.—Coso *Mining News*, Oct. 28: The New Coso furnace is shut down for the present in consequence (so it is said) of breaking the fan of their blower. Previous to this mishap they were turning out an average of 50 bars every 24 hours. The breaking of the fan (?), however, happened very opportunely, as it will give them a chance to fit up their croquet ground, the mallets and balls having arrived on Wednesday last; also their "shuffle-board," intended, no doubt, for the benefit of chaps who are receiving large salaries and who have so little to do that they need some exercise of that kind. One of the brass weights for the shuffle-board was lost some days ago, otherwise the game would have been started before. It has arrived, however, per Wells, Fargo & Co.'s express, and the game will undoubtedly be started at once. When the boys begin to shove the weights on the shuffle-board the New Coso stocks will be shoved up to a higher figure. When superintendents are dissatisfied with their salaries and engage in side-games, keeping saloons, hoarding horses, etc., compelling men to spend their earning with them on penalty of being discharged, is it to be wondered at that their stocks do not appreciate in the market? Out upon such humbuggery! We have good mines here, but we want men of sense and capacity to run them, and we don't think it is necessary to go to France or Canada to find superintendents to manage them. This sort of thing accounts for the dull times in Darwin.

Rex Montis Mine.—Inyo *Independent*, Oct. 28: An important development was made in the Rex Montis this week, and of course Manager Holt feels highly elated. The value of this discovery will readily be perceived when it is understood that now a safe estimate can be made of the extent of the chimney and approximate number of tons of high grade ore which was struck in the upper tunnel. The upper tunnel is in 112 feet, cutting 90 feet of its length in ore. Some 75 feet lower down is the second level, where the men have been at work for some time, the object being to find this same body of ore and obtain some idea of its extent. Monday last Mr. Holt predicted they would strike it in 24 hours; this was after they had gone about eight feet without a sign of ore. Holt staked his mule to a snowbank and awaited results; and sure enough he had not to wait long till they did strike it, and rich at that. Now it only requires a simple geometrical calculation to size the pile between the two levels. An assay was made from a specimen about the size of a man's head which gave a clear assay value of $500 per ton, about the average for all high grade ore. As long as the weather permits the ore will be packed down to the mill, there being enough now in sight to keep it running a long time, and to its full capacity.

KLAMATH.

The Mines.—Cor. Lake County *Bee*, Oct. 28: Our mines are principally quartz. The Black Bear mine is the most profitable, and is worked in the most scientific manner. The company has built a boiler outside the mine, and conduct the steam in pipes 1,200 feet to the engine, and steam pumps in the bottom of the lower levels. The shaft is down 260 feet, and paying better the farther they descend. The Yellow Jacket, belonging to the same company, and worked through the same tunnel, is opening finely upon a large body of very rich ore. This mine has paid well, but the chief characteristic is the quartz is found in bunches. As the company descends upon the ledge the mine is less broken and the bunches are larger. It is deduced from this that in 100 feet more descent the ledge will be continuous and the wall unbroken. The Klamath quartz mine is being opened by John Daggett. This company has heretofore done too much dead work to be profitable, but they were ambitious of a full development at an early period and were lavish of their means. This is one of the best appointed mines in the State, and can be worked very economically. The Evening Star is paying well. This is a four-stamp mill and has proved an excellent investment since it started. That it does not pay better is for the reason that it has no more stamps. The ledge is 12 feet thick.

MARIPOSA.

Washington Mine.—Mariposa *Gazette*, Oct. 21: On Wednesday morning last we visited this mine, where we met Mr. George E. Webber, Jr., the gentlemanly superintendent, who kindly furnished us with the following interesting items pertaining to this valuable property, which is, without doubt, better and more judiciously managed than any of the kind in California. The mine, mill, hoisting machinery and chlorination works are all in excellent order. One hundred and twenty-five men are employed in and around this mine and mill. All in that section are benefited from the product of this mine. The mill is run by steam power and contains 20 stamps, and is kept in motion day and night, crushing 30 tons of rock per day. The yield averages $15 per ton. The crushing never ceases excepting for repairs, which seldom occurs, and the days for cleaning up the gold, which takes place every two weeks. The company is well fortified against any and all emergencies that might cause a detention for a time in extracting the ore from the mine. They have at this time upwards of 1,500 tons of ore upon the dump. The ore taken from this mine contains a large percentage of sulphurets, which are concentrated at the mill. They are saved up during the summer months, and some time during the winter or spring they are roasted and chlorinated. The company has on hand at this time about 200 tons of sulphurets, which will yield from $75 to $80 per ton. The company is well provided for the winter with all necessary supplies. There is also piled up in the yard adjoining the mill 2,500 cords of wood—enough to start a wood yard on a small scale. The portion of the county in which this mine and mill are situated, commonly known as the Quartzburg and Hornitos quartz mining district, is literally threaded with gold bearing quartz veins, none of which, except the Washington mine, have ever been thoroughly prospected. A great deal of prospecting has been done in that vicinity every year since 1849 up to the present time, and a great amount of gold has been found and extracted from the croppings of many veins. We venture the assertion, however, that with the exception of perhaps two or three veins, there cannot be found a shaft sunk to exceed 30 feet. In other words, the Washington mine stands alone, and is the only one in that neighborhood that has been properly worked, thereby developing a mine which could not at this time be purchased for half a million dollars. The intrinsic value of this mine was ascertained simply by sinking a shaft; and if the amount of labor that has been spent by many claimants of veins, in digging coyote holes upon the outcroppings of veins, had been expended in a well directed and skillful manner sinking shafts, there would have been many other than the Washington that would have been yielding gold in fabulous quantities

NEVADA.

New Works.—Nevada *Transcript*, Oct. 27: New hoisting works have been put up on the Pittsburg mine, in place of those recently destroyed by fire. The company owning the mine have labored under a great many difficulties in reopening it, but we hope and believe they will be amply rewarded when they do get down to regular work. The Nevada mine, under the superintendence of Wm. Berry, is doing splendidly. It does not fail to pay a nice little dividend each week, and the prospects of the mine were never as good as now. The owners of the Providence mine are erecting works in which to use the Monnier process. The mine is so thoroughly opened that when all the gold in the rock can be saved, it will yield just about any amount that may be called for. There is rock enough stripped to last for a year or two without doing any dead work.

A letter from San Francisco tells us that Skiff Murchie was still there when it was written, negotiating for the sale of the mines belonging to his family. All that is needed to make a first-class paying property up there, is coin to open out and put up machinery with.

Mining Property in Demand. — Nevada *Transcript*, Oct. 26: We find the following inquiry in the Grass Valley *Union*: "What can 1,000 shares of, together with one-half the number of shares, in the mine of the North Extension of the Allison Ranch Franklin mine be had for? Address lock box No. 13, Nevada City, Cal." A year ago we presume that the property inquired about could have been bought for a song. Now it is, no doubt, very valuable. The Allison Franklin is a new mine located near Allison ranch, and on the north extension of the old Allison Ranch mine, which was probably the richest quartz mine ever worked in the State. The Allison Franklin is on the north extension of the old mine, and it is proving itself richer, if possible, than the old one was in its palmiest days. There have been 500 tons of rock taken out, all of which paid way up into the hundreds. A new mill has been erected, and will be ready for work in about three weeks. The extension inquired about, it may reasonably be supposed, is as rich as the original, and can probably be opened without assessments. Hence we conclude that the owners will consider it valuable property. This is only one instance showing the advancement in value of mining property of the county, and the inducements which the county holds out for prospectors and capitalists wanting to invest in mining property.

The South Yuba Canal Sale.—Nevada *Transcript*: A great many owners of hydraulic claims in this vicinity have been troubled about the sale of the South Yuba canal company to Alvinza Hayward, anticipating that in the future they could not get as much water from the company as they have in the past. It is the intention of the company to supply water in this vicinity in a greater quantity than heretofore, if the demand requires it, and also to run the water to Blue Tent in quantities sufficient for their use. Mr. Hayward's water bills for his claims in Placer county have averaged in the neighborhood of $100 000 each season, and yet he has not been able to get all he required. The property was offered to him for $510,000, and knowing that it was a matter of but a very few years he would pay out that much for water, it was better for him to buy the whole property right out. We also understand that Hayward contemplates acting with the greatest liberality, and intends to accommodate to his utmost ability all those who have dealings with the company.

PLACER.

Mining Items.—Dutch Flat *Forum*, Oct. 26: Since our last issue the weather has been favorable for outside work, and the owners of the various claims in this vicinity have been busily engaged preparing for water. The reservoir of the South Yuba canal company, near Alta is nearly completed. It is built in a very substantial manner, and there will not be any risk in filling it the first season. This reservoir will be of great convenience in distributing water to the various claims in this section, and will save the company much water which would otherwise be lost.

Baker Claim.—The Yankee tunnel has been completed to the Baker claim, and is now connected with the Baker shaft. The men driving the branch tunnel broke through on Saturday last. This is the third shaft on the line, is 150 feet in depth and is situated about 2,100 feet from the mouth. Through it the Baker, Wisconsin and Michigan claims can be washed to the bedrock. Men are now engaged constructing sluices in the tunnel below, and we may soon expect to hear that the Baker claim is ready for washing.

Elmore Hill Claim.—The superintendent is driving three powder drifts, one of which is a long one, extending across the channel, for the purpose of prospecting. The gravel proves to be much richer than any washed off last season, and it is believed that the product the coming season will be very large.

The Franklin, Boston, Lakamp, Yankee, Central and Summerset claims are in working order and waiting for water. At Gold Run the Miners' ditch company and South Yuba canal company have been making extensive repairs on their ditches, by the construction of new flumes in place of the old ones.

PLUMAS.

Genesee Quartz Mine.—Plumas *National*, Oct. 21: On the south side of Genesee valley is located the mine called by the above name. It has been steadily worked in a remarkable way since 1859, and we believe, has always paid liberally for the labor expended. The mine was first worked as a hydraulic claim, the gold which had escaped from the decomposed quartz having made the ground from the ledge to the level of the valley very rich, and as high as $40 to the man per day was realized in some portions of the ground which was sluiced off. The washing done in this way developed many small quartz veins, exceedingly rich. A small horse arastra first commenced crushing the rock, and rock which paid hundreds of dollars per ton was run through this primitive machine. The horse arastra was succeeded by a larger one, run by water, and of a capacity to crush about one ton of rock per day, and the company owning this mine realized considerable money by this slow way of working. The mine changed owners several times, and always at good figures. A six-stamp mill was put up, and we believe that the present owners have added four or six more stamps. The mine is now owned by an incorporated company, and is now called regularly in the San Francisco Stock and Exchange Board and also in the Pacific Stock Exchange, and considerable of it changes hands daily. We do not remember of an assessment having been levied for years, and in this respect it is an exception. Recently a new Board of Trustees has been elected, and in a few days the capital stock of the company will be increased from 25,000 to 100,000 shares. The intention of the managers is to prospect and develop the mine in a systematic manner, and we believe if the proper amount of labor is done, a body of quartz will be found, very extensive and as rich as any mine in the State can boast of. It must be there, for in all the rock taken from the Genesee mine in the past 17 years, there never was a pound that did not contain gold, and in many places it has been wonderfully rich. We are glad that it is now to be opened as it should be, for it will make a name that will be heard all over the coast.

Items.—Negotiations are now pending, and it is thought that an extensive mining operation will be commenced in the blue gravel lead, at Bell's Bar, before a great while. There never was a time when Quincy was half as thriving and prosperous as to-day. More improvement has been made the present year than ever before in the same length of time, and there is every reason to think that the season of prosperity will continue. Mr. R. Z. Bell intends to start for his home in Dubuque, Iowa, in a few days, and Mr. G. M. Compton will take charge of the mine. In all probability the machinery for working the mine will be up this fall. Mr. Knapp has been appointed superintendent of the Franklin company's mine, on Willow creek

SIERRA.

Brush Creek—*Mountain Messenger*, Oct. 28: Workmen are busily engaged at the Brush Creek mine, at the Mountain house. The pump was to be started last Thursday. Jas. Middlemiss is superintendent. Oscar Jones, one of the proprietors in the Bald Mountain, has returned from his trip to the Centennial, looking healthy and satisfied.

New Company.—A company of Downieville gentlemen have purchased the interest of Al. Bixby in the American Hill gravel mine. Judge Gale, we believe, still holds his interest. Preparations are being made to work the claim vigorously this season.

South Fork.—The South Fork have not yet decided what course to pursue to work their mine.

North Fork.—The North Fork company, of Forest City, have their shaft completed all but about 15 feet. It will be finished this week. The work on the tunnel is progressing satisfactorily and rapidly.

TUOLUMNE.

Mining Items.—Tuolumne *Democrat*, Oct. 28: The Soulsby mine is evidently making a profitable run, as the entire apparatus connected with it is in full operation and no complaints are made by the miners in regard to a lack of money. Quite a number of neat cottage residences have been lately erected at Soulsbyville by the workmen at the mine, and the signs of prosperity are plenty in this thriving mountain village. The company has erected a new boarding-house with all the modern improvements and with the surrounding structures presents an indication of activity which, if it continues a few months longer, will rank Soulsbyville with Columbia as the second town in the county. The Churchill mine, owned by Messrs. Esterbrook, Floyd & Leachman, in close proximity to the Soulsbyville mine, have commenced active operation, a shaft being sunk to a depth of 45 feet. The progress in this direction hereafter will be slow, from the fact that very hard rock was struck at a depth of 42 feet. The same activity prevails at the Ohio mine, the mining force having been increased considerably during the past few weeks.

YOLO.

California Quicksilver Mine.—Yolo *Mail*, Oct. 26: R. G. Hart, mine manager and assistant superintendent of the California quicksilver mine, paid a visit to our office on Monday evening. The management of the mine has been newly organized, with Mr. F. E. Smith, of Sacramento, as store keeper and clerk, and T. J. Fuqua supervisor of the ranch and teams. The inhabitants number about 125, and several new houses have been erected and families moved into them during the past season. They have added a new furnace to the works, which is just finished, and with their present capacity are doing more than any mine in the State in the production of quicksilver.

Nevada.

CORNUCOPIA DISTRICT.

The Mining Outlook.—Cor. *Silver State*, Oct. 23: In the future I see the Hussey, the Fishor, the Leopard, the Tiptop, the Mammoth and the Alameda assuming their places among the prominent and best paying mines of the State or coast. In proof of this look at the product of the Leopard in the last six months, as reported in the stock journals and seen in the bullion shipments. Jim Morgan was here the other day to spy out the land in the interest, I suppose, of the stock men below, but his mission was suspected and he could not get into the mine, and then he said he did not care, etc., and I think he was right, when the Leopard is paying dividends that ought to satisfy him. Its products exceed its expenditures, including the loss of the mill, which was burned down. In truth, we have the mining camp of northern Nevada.

EUREKA DISTRICT.

To Start Up.—Eureka *Sentinel*, Oct. 25: The Geddes & Bertrand mining company has leased the Pinto mill, which will be started up next Monday on ore from the company's mine at Secret canyon. There are 1,500 tons on the dump and plenty more in sight in different portions of the mine to insure a continuous run for an indefinite period. The mill has 20 stamps, and it is expected to work on an average 25 tons of ore per day. James Mes, an experienced mill man, has charge of the works at Pinto, while Mr. Jenkins has the management of affairs at the mine. Under the present management we predict for the Geddes & Bertrand a career of success unprecedented in the mining annals of eastern or middle Nevada.

OREANA DISTRICT.

Humboldt Company.—*Silver State*, Oct. 26: The Hurricane company have again started their furnaces, and will ship a carload of bullion to-night. Reports from the mine say it looks well, and is producing, with the force at work, ten or twelve tons of ore per day. The superintendent, John Williams, is a gentleman as well as an experienced miner and smelter, but the company is a little slow.

PEAVINE DISTRICT.

Rich Strike.—Reno *Journal*, Oct. 28: Day before yesterday we mentioned that extraordinary good ore was being taken from the Con. Poe mine, at Peavine. A letter from Superintendent Griffin to Secretary Brown, received yesterday, contains the particulars. The strike is in the south drift on the 150-ft level. Three assays have been made with the following results: No. 1, $1,957.11; No. 2, $1,056.37; No. 3, $376.34. This newly discovered body of ore is two feet wide. It is pleasant news to receive, and such as we anticipated. Next week the mill will start up crushing ore, and a satisfactory run is assured. In the mine everything is going along smoothly. The incline is being pushed ahead rapidly, and a large force will be kept at work in this part until a depth of 500 feet is attained. The silver lining of the Con. Poe cloud is beginning to show in sight.

REESE RIVER DISTRICT.

Connection Made.—*Reese River Reveille*, Oct. 23: Connection has been made between the 517-ft level of the Curtis shaft, and the 700-ft level of the Bowman incline, and the extraction of ore from the big chimney in the Panamint ledge, which lies between the two levels, will shortly be commenced through the Curtis shaft. That our readers may better understand the relative situations of the workings here mentioned, we will explain, that the 517-ft level of the Curtis is deeper than the 700-ft level of the Bowman incline. The Curtis shaft level is from a perpendicular depth and the Bowman level is from an incline depth. The body of ore was encountered at the 600-ft level of the Panamint, in which an ore chimney from three and a half to four feet in width was cut, carrying throughout a grade of ore sufficiently high to afford a large profit on its milling as taken from the vein without sorting. It was prospected to the depth of an additional 100 feet, showing the same width of vein and the same grade of ore all the way. To work it below the 600-ft level of the Bowman, and extract the ore through this prospecting incline, and thence through the Bowman incline, would have been inconvenient and expensive; so a cross-cut was run from the 517 ft level of the Curtis shaft, which tapped the bonanza at the 700-ft of the Bowman, and stopes have been commenced upward from that point, from which through the Curtis shaft, the ore can be cheaply and conveniently hoisted to the surface. All connections are now made and everything in readiness for operations, and in a few days the cages will be shooting up the shaft laden with their burden of precious metal hearing ores.

WASHOE DISTRICT.

Baltimore and American Flat.—Gold Hill *News*, Oct. 25: The ore vein recently struck in the east crosscut from the north drift on the 1050-ft level is still showing well. An upraise has been made which is showing ore of a good character, though what the extent of it is must yet be determined. Cross-cut No. 2 on the same level is also showing some ore. The east drift on the 1450-ft level is steadily advancing, the rock in the face showing strong indications of a near approach to the ore vein.

Aureola and Argentina.—New shaft down 77 feet this morning. The rock is becoming harder and more solidified, showing also better streaks of white quartz coming in among the red, and carrying a considerable amount of iron pyrites. Assays of this rock should also show gold.

Chollar-Potosi.—Daily yield, 100 tons of ore, the average assay value of which is $32 per ton. Sinking the main incline is making steady and fair progress. The pumps are kept running about three-fourths of the time. The new hoisting machinery at the combination shaft is completed, ready for use. The erection of the big pumping engine is going steadily forward.

Overman.—Sinking the main shaft is being pushed ahead at a very favorable rate, the speed attained being about two and a half feet per day. The immense new pumping beam is in place and the erection of the entire pumping machinery is fast approaching completion.

South End.—Sinking the shaft is being pressed ahead with the usual vigor. It is now down 274 feet, the bottom being in quartz and clay, mixed with porphyry. Some of this quartz gives good assays of both gold and silver, and the appearances are that at a depth of 200 feet more the shaft will cut the rich ledge of the Herald, which, without doubt, passes directly through the South End claim.

Sierra Nevada.—The south drift from the 1500-ft station is showing some very encouraging ore prospects. The north drift on that level is also passing through a much livelier and better character of quartz than has been encountered before in that direction.

Alta.—On last Saturday morning the large plunger lift pump at the 800-ft station burst, stopping the large pumping engine, and making it necessary to stop tha

sinking of the shaft until a new pump, which was immediately ordered, will arrive and can be put in place. This will cause a delay of about ten days' time. In the meantime, the water is being kept down in the shaft by bailing tanks.

SUCCOR.—The new hoisting engine is in position and will be ready to start up by Friday or Saturday of this week. It is necessary to start the hoisting engine first, in order to use it in lowering the heavy pumps and columns into the shaft.

LADY WASHINGTON.—The pumps are being placed in the best possible condition, to manage any influx of water. The main east drift at the 850-ft level is again being pushed ahead lively.

UNION CON.—The east and west cross-cuts from the north drift on the 1300-ft level are each advancing in very favorable ledge matter.

CON. VIRGINIA.—Daily yield, 450 tons of ore. The ore stopes on the 1400 and 1550-ft levels are looking finely. Especially is this the case with the ore stopes going north on the 1400-ft level. About 45 feet in width of these stopes is to-day yielding rich ore, which for richness was never exceeded by any considerable body of ore yet extracted from the mine. On the 1700-ft level the north drift is again steadily advancing, though slowly. The heat in face is intense. Additional blowers are being put in to furnish a better supply of air and drive the Burleigh drills. At the 1650-ft station of the C. & C. shaft the west drift to cut the ore vein is now drained perfectly dry, and is being pushed ahead with all the speed possible to reach the ledge. The mills are all kept steadily running up to their full crushing capacities. A large new ore dump is being constructed at the C. & C. shaft, and the side switch of the Virginia and Truckee railroad will be completed to the shaft in a very few days more, ready to commence the shipment of ore as soon as the ledge is reached.

CALIFORNIA.—Daily yield, 450 tons of ore. The ore stopes on the 1500 and 1600-ft levels are yielding splendid ore. On the 1500-ft level the ore breasts between cross-cuts Nos. 5 and 6 are extended directly across the vein, an opening drift being kept a few yards in advance. The breasts and this drift, which is now 30 feet in advance without yet having reached the wall, already have opened the vein to the magnificent width of 230 feet. How much wider it is at that point yet remains to be seen. The main south drift on the 1600-ft level is steadily advancing through the center of the ore vein, the face still in rich ore. This drift is making about two feet per day, and shows the ore vein to be a solid mass of rich pay ore as far as it has yet penetrated. The drifts and winzes on the 1300 and 1400-ft levels are all being put in the best possible repair. The mills are crushing the ore as fast as it is extracted. Sinking the C. & C. shaft is making the usual progress, the flow of water at the bottom being strong and keeping the pumps busy.

JUSTICE.—Daily yield, 160 to 165 tons of ore. The ore stopes are looking well at all points. The upraise in the ore body from the stopes on the 400-ft level is showing a fine body of ore which will yield from $60 to $80 per ton. The development of the ore body downward below the 600-ft level is proving it to be rich in stephanite and ruby silver, some of the choice pieces fairly glittering with the precious metals. On the 800-ft level a winze has been started in the ledge between cross-cuts Nos. 2 and 3, the bottom of which is yielding ore that assays rich in gold. The ore in the face of cross-cut No. 4 on that level is showing a steady improvement in quality. Cross-cuts Nos. 1, 2 and 3 on that level are steadily advancing in ledge matter of a highly encouraging character.

TROJAN.—The cage and shaft arrangements are now all right again, and the development of the mine is going ahead. The northwest drift at the 300-ft level is being pushed forward into the ore body, and excellent pay ore is being taken out. The same may be said of the upraise at that point. The main north drift is also being advanced again, and near the north end of it cross-cuts are being made both east and west.

YELLOW JACKET.—On the 2040-ft level a cross-cut has been started to the westward at a point 100 feet south of east cross-cut No. 1. Sinking the south winze below the 1940-ft level is making good progress. The north drift on the 1940-ft level, running to connect with the Imperial mine, is being pushed rapidly ahead. The grading has been completed from the railroad to the site of the new shaft, ready for a switch or sidetrack, which will be built by the railroad company at once.

OPHIR.—Daily yield, 300 tons of ore. The ore breasts show little if any change during the week. The north and south prospecting drifts on the 1650-ft level are steadily advancing, and are both looking more favorable for good ore developments than at any time in the past. Sinking the main incline is going rapidly ahead. The north drift on the 1700-ft level is steadily advancing, the face in very favorable ground. The ore dump at the head of the main incline is about completed.

BELCHER.—Daily yield, 300 tons of ore. The new pumping engine seems, so far as tried, to be all that was expected of it. The air and drain shaft, to connect with the south drift from the Crown Point on the 1700-ft level, is completed.

FLORIDA.—The shaft has been sunk since last report 13 feet. On Sunday last the bottom of the shaft cut the east clay wall of the ore vein, which is solid, well defined and indicates a more concentrated condition of the ore vein than the ledge has developed on the levels above.

AMAZON & GLASGOW.—Sinking the main shaft has been resumed with all possible vigor. The new pumping machinery is working with the utmost perfection, and is doing good service.

BULLION.—The east cross-cuts on the 1400 and 1500-ft levels are steadily advancing, the face of each being in ledge matter of a highly encouraging description. The east cross-cut on the 1600-ft level is also steadily advancing toward the ore vein. A south drift is being run from this cross-cut to connect with the main incline for air purposes.

JULIA.—The main south drift on the 1600-ft level is steadily advancing, the face still in quartz and low grade ore. This ore development so far to the south and east, the face of the drift being about 670 feet south of the shaft, is one of much value, and proves a concentration of the ore vein much farther to the south and eastward than was ever expected at that depth.

GOULD & CURRY.—The north compartment of the shaft has been finished down to the 1700-ft level. The south drift on that level has been again started up, and is making good progress. The east drift on the 1700-ft level is also cleaned out and repaired, preparatory to being again driven ahead.

BEST & BELCHER.—The most important move that we have to record of this mine is the starting of a cross-cut east a little north of the center of the claim on the 1700-ft level. This cross-cut will be driven in a distance of 50 feet, just far enough to make room for the use of the diamond drills, which will then be used to prospect the ledge and drain the water if any be found in the vein.

COSMOPOLITAN.—The Hope mill is kept steadily running, and the mine is showing more ore in sight at the present time than ever before. The stopes in the upraise above the adit level are yielding well, and the drifts both north and south from the winze below that level are in very good ore.

NEW YORK.—The pump compartment continues to be raised upon at the rate of seven feet per day, leaving some 260 feet yet to raise in order to complete the shaft to its full size from top to bottom. The excavations for the pump tanks are finished, and the tanks will be put in shortly.

MEXICAN.—The upraise on the 1465-ft level is showing more quartz of a better character. It begins to look as if a body of pay ore might yet be found in the unprospected ground lying to the east of all the old workings above the 700-ft level.

IMPERIAL CON.—The greater portion of the week has been spent in repairs to the incline hoisting engine, which consumed three days, and the laying of a track in the main incline with T rails of the best steel manufacture.

CROWN POINT.—Sinking the main incline below the 1800-ft level is making splendid progress. It is now down 1,880 feet. The south drift on the 1700-ft level, last Monday morning, completed the connection with the combination Belcher air shaft, completely ventilating the mine on that level and opening a drain for the water into the Belcher pump shaft.

HALE & NORCROSS.—Another of the large lift pumps has been put in 80 feet below the 1800-ft level, and will be ready to take the water this afternoon. This will do away with the use of the small steam pumps down to that depth, and it is confidently believed will enable a strong and immediate gain to be made on the flow of water at the bottom of the incline.

SILVER HILL.—Sinking the main incline is going forward at the rate of two and a half feet per day. The flow of water is not so strong. An ore shute is being constructed at the 650-ft station. This shute will soon be completed. The north drift on the 444-ft level is in a distance of 670 feet, the face in quartz and vein matter of very favorable description.

NORTH CON. VIRGINIA.—Sinking the shaft is being pressed ahead with all possible dispatch. During the week an accident happened by which a cable was run into one compartment of the shaft. It was all taken out and work resumed at the bottom in three hours' time after the accident.

HERALD.—The north drift on the 160-ft level last Sunday afternoon struck a continuation of the ore found a few days ago and which had apparently pinched out. The broken place in the ledge has been passed, and yesterday the ore was of as fine character as any that has ever been found in the mine.

WEST BELCHER.—The Vivian mill is engaged to run on ore from this mine, and ore extraction for this purpose is to be commenced forthwith. There is plenty of good pay ore developed in this mine at the 300-ft level, the up-raise above it and other points, to keep three or four mills running.

NORTH CARSON.—Main shaft now down over 400 feet, and the bottom all in the vein, showing splendid streaks of ore, some of which give very high assays, bidding fair to concentrate into a good paying ore body.

NIAGARA.—Sinking the main incline is making excellent headway. The bottom is in good working ground. It is down 489 feet. The machinery is working well.

SUPERIOR.—Excellent work is being done. The tunnel from the ravine to cut the ledge below the bottom of the shaft, draining the shaft and establishing good ventilation and ore extraction facilities at the same time, is progressing finely, and will reach the proposed intersection in the course of five or six weeks.

KOSSUTH.—The west prospecting drift on the 600-ft level is steadily advancing and is expected in a very short time to reach the ore vein. Some rich streaks of quartz and ore have already been encountered.

GLOBE CON.—Ore extraction from the old stopes and breasts will be commenced shortly, the main incline and ore shute being cleaned out and in readiness.

DAYTON.—The station at the 920-ft level is being opened as fast as the soft character of the ground will permit. The several cross-cuts on the 500-ft level are being steadily advanced, cross-cut No. 6 showing evident signs of a near approach to the ore vein.

ALPHA.—The laying of an iron track in the main incline of the Imperial shaft has stopped the hoisting of rock, and greatly interfered with the headway of the north drift on the 2000-ft level during the week past.

LEVIATHAN.—The north drift at the 600-ft level is still pushing ahead in very good ground, and passing through occasional streaks and bunches of good ore offshooting from the main ledge to the eastward.

CALEDONIA.—Sinking the main shaft is progressing at the rate of two and a half feet per day. The rock hoists well and the flow of water is still strong.

PROSPECT.—Main drift west from the 400-ft station is pushing ahead, still in hard rock. It is nearing the main ledge and should reach it soon.

SUTRO TUNNEL.—Total length of tunnel, from mouth to face of header, last evening, 14,787 feet. The face is now in harder rock than last week, but blasting and working better, requiring less trouble in timbering, and consequently allowing of faster advancement.

BUCKEYE.—The mine has been entirely shut down, with the exception of running the pumps to keep the water down. It is expected that everything will be in readiness to resume work at all points on the lower levels by the first of November.

MINT.—The shaft is now down 1,278 feet, the bottom in much softer material, being a mixture of clay, quartz and porphyry, of a highly encouraging character.

MOORE & MORGAN.—Shaft 60 feet deep, and contract let to sink it 100 feet deeper. The bottom is in very promising looking quartz, evidently the outside of the ledge.

WELLS-FARGO.—The new hoisting works building is completed. The engine and other machinery is on the ground ready for erection.

TWIN PEAKS.—Sinking the new shaft is making very good progress in favorable working ground.

WASHINGTON.—Sinking the main shaft is making excellent progress. The flow of water at the bottom is still giving some trouble.

UTAH.—Sinking the shaft is making good progress. It is now down 967 feet, the bottom still in good blasting rock. The flow of water is light and gives but little trouble.

ROCK ISLAND.—The flow of water at the bottom of the shaft shows a slight decrease, but still keeps the pumps steadily running.

SOUTH OPHIR.—Work is being commenced to sink the proposed new working shaft.

SAVAGE.—The pumps are kept busy, and the water is gradually though slowly being lowered. Only about 30 feet of gain has been made during the week.

Continued on Page 308.

TELEPHONY.—On the evening of October 9th, Alexander Graham Bell and Thomas A. Watson conducted a series of experiments on a line of telegraph wire stretched between Boston and Cambridgeport, a distance of two miles, by which audible speech was conveyed from one end to the other in the most satisfactory manner, by the medium of electricity only. The explanations are not very clear, but it appears that "telephones" were placed at each end of the wire and a battery of ten carbon cells used. Articulate conversation then took place through the wire. The sounds, at first faint and indistinct, became suddenly quite loud and intelligible. The experimentors at both ends of the line took notes of what was said and heard, with a result entirely satisfactory in showing a marvelous degree of accuracy. The discovery of the system of talking by telegraph is due to Mr. Bell, of Boston.—*Alta.*

CHANGE OF SUPERINTENDENTS.—Mr. George Westfall, superintendent of the Trojan mine, has resigned his position, and James O'Donnell, well known to the mining men of the Comstock, has been appointed to fill the vacancy. Mr. O'Donnell is one of our best miners, having filled the position of foreman in the Yellow Jacket and Imperial mines for several years past, and is just the man to fill the office. Mr. G. A. Roth has been retained as Secretary.—*Gold Hill News.*

THE ENGINEER.

The Isthmus Canal.

An isthmus ship canal, by which vessels of any size could pass from the Atlantic to the Pacific Ocean, was an important point in our national schemes and dreams of commercial grandeur in the days when the project for the Suez canal seemed the vaguest possible speculation. But the Suez canal has been made, an enormous tonnage is passing through it yearly, while our great project has almost dropped out of men's thoughts; and though the government still maintains some sort of diplomatical relation to the great idea, it is not likely that an economical Democratic congress would give 25 cents for all the isthmuses and the two oceans together. Such is the consequence of economy when parties have it badly with a view to political effect. It will not answer to say that the Suez canal was built because it was in the soil of "effete" and "unprogressive" Egypt, and that ours was forgotten because we are so tremendously progressive and energetic and wide awake. We may better say that they had peace and we had war; and as we may always say of such great projects, "These are imperial works and worthy of kings." We may say here that the Khedive played the sovereign handsomely in his princely encouragement of a great enterprise, while we, the sovereign people, played the same character very meanly in a similar relation. Now, however, the isthmus canal project is brought to the attention of the world in new relations. There has recently been organized in Paris a body especially for the preliminary study of the subject, which body has ostensibly strictly geographical relations, but the practical nature of which is guaranteed by the fact that its president is M. Ferdinend de Lesseps, who made the Suez canal. The vice-president is Vice Admiral Ronciere le Noury, and the secretary, M. Leon Drouillet, an engineer. The nucleus of the body thus formed is a committee of the Paris geographical society, which invites the cooperation of all other geographical societies in the world, specifically to determine, by minute study of the geography of the isthmus, at what point and in what condition it is possible to make the canal. This body starts, of course, from the assumption that the enterprise has not hitherto been effected because of the contradictions involved in the numerous surveys made, and because of the impossibility of reconciling the various interests related to these surveys, and it further assumes that the very contradictions involved are an evidence of insufficient study of the country. Its proposition is to organize, by the thorough geographical study of the district. Its labor will certainly have the sympathy and encouragement of all who desire the success of the more substantial points of national progress.—*New York Herald.*

A New Style of Tunnel.

We read in the *Polytechnic Review* that John C. Trautwine proposes a new plan for constructing tunnels under rivers and the like. The following is the description of the invention: At the present time, when so many tunnels are being projected beneath the beds of rivers, or even of arms of the sea, any suggestions for diminishing the labor, expense, or well known hazard of such constructions is especially opportune. Mr. Trautwine's proposition is somewhat startling from its novelty. His broad proposition is to abandon the usual method of perforating the tunnel beneath the bed of the stream; and to construct it above water, upon a strong solid wooden platform several feet in thickness, which shall serve as a base for it to rest upon after it is finally deposited in its place. The tunnel and its platform are then to be sunk into a trench dredged across the bed of the stream for their reception. The depth of the trench may vary with circumstances; in some cases it may be so deep that when the dredged earth is thrown into it again the top of the tunnel will be entirely beneath the original bed of the stream. This will evidently be necessary when the full natural depth of the stream is required for navigation. When this is not the case, and the depth of the stream admits of it, the tunnel may be put partly beneath the bed, or may even rest upon it. In either case, the tunnel may then, if necessary, be surrounded and covered with earth and rough stone, to protect it from ice or other floating bodies, or from dragging anchors, etc.

When the bottom of the trench, or of the river bed, is soft, piles would generally be driven for the wooden base of the tunnel to rest on.

Only a very short tunnel could be sunk entire. A long one would be made and sunk in sections of perhaps 100 or more feet in length; and the short intervals, or joints between these sections, could afterward be filled up by means of divers or by coffer-dams, caissons, etc. In water of moderate depth the sections may be at once built on the very spot they are to occupy by means of coffer-dams. The most prominent advantages that present themselves to us in Mr. Trautwine's method over the common one are, first, the avoiding of the danger to the lives of the workmen (together with the delays and the expenses) attendant on the breaking in of the river bottom, or the sudden irruption of quick-sand, or spring of water. Second, that inasmuch as the tunnel need not be placed at so low a level, its excavated approaches may be materially shortened at a corresponding saving of expense. For instance, if the top of an ordinary tunnel has, for safety, to be placed say 30 feet below the bed of the stream, and if the excavated approaches to it be on a grade of one in 50 (or 106 feet to a mile) it is plain that the approach to each end must be 30 times 50 feet longer than would be necessary if the top of the tunnel were at the bed of the stream. In other words, the two excavations for approaching the tunnel by the old method must together be 3,000 feet longer than for one built on Mr. Trautwine's plan. If the more desirable grade of one in 100 (or 53 feet to a mile) be adopted, the difference becomes 6,000 feet, or more than a mile, in favor of Mr. Trautwine's plan; and where the top of the tunnel can be placed above the bed of the stream, the difference will be still more in his favor.

Another advantage in his method is that it obviates the necessity for the extreme care that must be taken to secure a perfect alignment for the tunnel, in order that the two halves of its length (commenced at its two ends) shall meet at its center.

Communication with Central Africa.

Mr. McKenzie's surveying expedition, which left England in June for the purpose of surveying the bed of the proposed inland sea, appears to have ended in a fiasco. *Iron* says: It seems to have been imperfectly provided with the usual and necessary appliances of a surveying expedition, and quarrels and secessions took place. After arriving at Cape Juby, enquiries were made for the "boccas" or supposed mouths of the inland sea formerly occupying the depression in the Sahara known as El Juf, and several of these were found about 40 miles to the north of the cape. The most likely one was the Bocca Grande, a rift in the rock-bound coast about three-quarters of a mile wide, and cut off from the Atlantic by a sand-hill about 40 feet high. It was seen to extend seven or eight miles inland, bounded by cliffs on each side, but whether it expands into the famous El Juf, or, indeed, whether its bottom is below the sea level or not, could not be ascertained. No levels were taken, either there or in the depression of El Juf; in fact, the latter was never seen. The expedition returned to Grand Canary early in August, and was broken up. This is the only account that has been yet received, and it is evidently not from a friendly hand; when the leaders return we shall perhaps hear more about what seems at present a tissue of helpless mismanagement. Against it, it is, however, pleasant to be able to set a successful a tempt to establish communication with the interior from Zanzibar, in connection with the projected establishment, by the London missionary society, of a station on Lake Tanganyika. It occurred to the directors of that institution that if the South African wagon, with its 3,000 pounds weight of stores and long string of oxen, could be successfully introduced, the difficulties of the route might be got over, and about the time that Mr McKenzie and his followers left London, the Rev. Roger Price had succeeded in taking a wagon to Mpwapwa, on the central plateau, in 26 days, finding neither jungle nor swamp, hill nor tsetse fly to hinder him.

TELEGRAPH EXTENSION IN AFRICA.—It is proposed to carry a wire to the cape across the African continent. There is at present telegraphic communication from Alexandria to Khartoum, a distance of 1,100 miles, and surveys have already been made for its continuance to Gondokoro. From Khartoum to Delagoa bay, where the South African lines terminate northward, is only about 2,600 miles, shorter than existing lines on the other three continents. The route would lead under the Victoria Nyassa and Tanganyika lakes, and thence down the Shire and Zambesi rivers to the sea, where a short ocean line would connect it with Delagoa bay or Port Natal. A branch would go from Ujiji to Zanzibar. Of the 1,500 miles or so of aerial line it is suggested that much might be erected without the expense of poles by taking advantage of the trees over thickly wooded tracts, which are frequent in tropical Africa. The difficulty would be to keep the natives from utilizing the wire in regions where iron is scarce and valuable, but this might be got over. The undertaking, if it could be established and kept in working order, would be exceedingly lucrative, and would in many ways aid in opening up Africa to commerce and civilization.—*Iron.*

NOVELTY IN MARINE ARCHITECTURE.—The Canadians find the ice which for nearly six months every year blocks the St. Lawrence a great barrier to direct European trade. How to overcome it is a problem their shipbuilders have been endeavoring to solve, and there has recently been launched at Quebec a vessel designed for making winter voyages down the St. Lawrence to Prince Edward island. If she is successful other and larger vessels on the same model may be built for European trade. She is named the *Northern Light*, and will be fitted for sea by November. She is sheathed with one of the hardest of woods—greenheart—and plated with iron. Her construction is such that there can be no right-angle pressure from ice on any part of the hull. The draft of water aft is 17 feet, and the screw is so placed that there will be at all times at least five feet of water above the upper blades, so as to prevent contact with ice. Her engines will be of 700 nominal horse-power.

Agricultural Experiments.

The progress of agriculture depends upon the dissemination of the truth which is now in the possession of the few, and the acquisition of new truth. If all our farmers possessed the secret of success which the few enjoy and act upon, the art of agriculture would be improved and elevated, and prosperity would be hight ened. If tha few, comparatively speaking, could increase their valuable possession of truth to the extent of which the industry is capable, the ecience of agriculture would be attained.

The way to gain truth is to search for it. It is to be determined hy experiment, by actual investigatiou. Tha true method of ascertaining facts is the scientifio method. It matters not whether tha experiment he conducted in the field, in the orchard, in the vineyard, in the stable or in the laboratory of the university; if it be conducted with a discriminating understanding of the conditions involved, and if the result be read in harmony with these conditions, it is a scientifio experiment. A useful fact is no better if discovered by a practicel farmer than if discovered hy a professor, nor is it any worse. In so fer as each guins the truth, each is doing something for the progress of agriculture. It is one of the hopeful signs of the times that thie oneness of truth, however gained, is becoming more widely recognized. It is hopeful that the oldtime warfare between the so called "practicel" und "scientifio" is passing away. One cannot succeed without the other.. True practice aud true science are mutually dependent in their efforts for the promotion of agriculture.

The value of experimental stations for the discovery of the science involved in uricultural operations is hecoming more generally recognized. The Eoropean stations are enriching our agricultural literature with most valuahle discoveries. These new facts, coming to the attention of the farmer through his newspapers and periodicals, are being applied to farm work. The intelligence of the farmer enebles him to adept the new truth to the peculisr conditions which surround him. The chenges in the application which he has to make require sometimes almost as great inductive skill as that which led to the original trnth, and the farmer becomes in turn an investigator, a discoverer.

In our own country the tendency toward the puhlio experimental stations is very marked at the present time. During the last two yeers a station, something on the European plan, has begun its work in Connecticut. New York is conducting some very valuable researches at Cornell university, and several uther Stetes, supplementing the endowment of the National Government, are pushing ahead for the truth involved in agricultural practice. The latest movement which we hear of comes from the Green Mountain Stete. One of the great interests of the State is the dairy, end the dairymen have an association which is one of the most wide awake in the country. The secretary of the society, Mr. O. S. Bliss, a gentlemen whom we know as one of the most enterprising and public spirited lehorers for progress, writes as follows concerning the need for action in the way of discovering new and valuable truth: "Appearances indicate that more of the principles of successful and economical dairying will be developed in tho next 10 years than are now known. This development will not be limited to the processes uf manufeoture and the marketing of the products, hut will extend to the details of tillage. hreeding, feeding, etc., embracing all the arts in any mesner suhsidiary to the dairy. Exact knowledge of principles and the effects of various practices is what we need and must have in the plece of vegne hypotheses and unfounded opinions. While the associetion should not relax any of its efforts to elicit information from any and every source as in the past, it should at once establish an experimental dairy farm, stocked and equipped, upon which a thoroughly competent and practical man may, by careful and exact experiment, sift every theory supposed to have a modicum of truth, hearing upon the material prosperity of the Stete."

We trust Mr. Bliss will succeed in his commendahle effort. And the question arises, what lesson may be drawn from this enterprise? If in old Vermont, where generations of farmers have lahored and do not yet understand the conditions under which they work and the agents they employ, there is need for public investigation and experiments for the public information, what ie the need here, where a single generation hae not finished ite work, and where the capahilities of the soil and climate are altogether beyond our underetanding of them? And what are we doing to possess ourselves of this knowledge? We are working with the most enlightened and progressive farming population of any State in the Union, and each year new agricultural triumphs are heing attained. We are extending our production and our commerce hy sending new produots to new markets. Thie ie good. But there are questione continually arieing which no man can answer because the anewer must he sought for hy most careful inveetigation and experiment. What are we doing ae a State to hestow upon our grand agricultural interest the benefite of a scientifio investigation of the thousand questions which ariee concerning the true practice under our new conditions?

Useful Information.

Hints for Grainers.

The following recipes are for mix ·· the ground colors for the following styles of graining:

Light Wainsoot Oak.—White lead and yollow ocher, mixed to the required tint. Some grainers prefer a perfectly white ground for very light oak for inside work, hut it is always difficult for any hut a perfect master of the art to proceed on u white ground, and the work, when completed, is apt to have a ohalky eff ct, even though a dark varnish be applied.

A Darker Wainscot Oak.—Mix white lead, middle chrome and yellow ucher.

Dark Oak.—White lead, Venetian red and yellow ocher.

Very Dark Oak.—White lead, raw sienna, burnt umher and Venetian red; or burnt and raw sienna, white lead and burnt umher.

These colors, mixed iu different proportiuns, will produce a multiplicity of tints suitable to receive the graining color, their strength heing. of course, determined by the greater or lesser preponderance of white leed.

Mahogany Grounde.—There are various uotions extant umongst grainers ae to the best grounds for mahogeny graining, some preferring a ground of a deep yellow cast, whilst others choose one approaching a bright red. The reds and yellows used are Venetiau red, red lead, vermilion, raw sienna, burnt sienna, orange chrome, middie chrome, etc. These colors can be mixed to the tint required, an addition of white lead being made in eaoh oase, as the positive reds and yellows are too powerful unless diluted in turn hy white. Venetien red, orange chrome and white lead are the colors most generally used, and these three will, according to their predominance or subordination, meke such a variety of tints that the most fastidious greiuer need have no misgiving that the result will not come up to his expeotation if he exercises due discretion in mixing the colors.

Rosewoon Gaounn.—Venetian red, vermilion and white lead. A little scerlet lake is added for superior work, but this of course is too expensive for general use. Some peinters mix with the reds a small quantity of raw sienna or chrome yellow.

Birn's Eye Maple.—White lead alone is preferred by some grainers, hut the majority of painters use a little yellow ocher to kill the rawness of the white, and this is much the better plan to adopt. Beginners are apt to make the ground too yellow, a mistake that should be avoided at the untset, as the varuish whioh has subseqnently to be coated over the work, will give trensparency and add a pale creamy tone, whereas, if the ground he too yellow, the result will be heaviness.

Satin Woon.—The preceding remarks apply equally to setin wood grounds.

For these light woods it is of the utmost importence to have the grounds paiuted with finely stained colors and perfectly smooth. Too much time can hardly he spent in their preparation.

Coal Dust Fuel.—The latest instance of successful experience with hurning coal-dust is as follows: The Ocean mill at Newburyport, Massachusetts, has for some time heen runniug upon coal dust es a fuel. For yeers they have kept an actuel accouut, with scales, of every barrow of coal wheeled into the fire-room, and the average weekly consumption showed 40 tone of broken coal on 18,000 pounds of cloth; average cost $7 per ton or $280 per week, which makes the oost of fuel per pound of cloth over one and one-half cents. Under the present arrangement, the weekly consumption is only 36 tons of pea and dust on 20,000 pounds of cloth, costing $3.50 per ton, or $126 per week, which makes the cost of fuel per pound of cloth less than six mills, showiug a saving of nearly one per cent. per pound. This mill is run entirely hy steam, and the cost of one and one-half cents per pound in hurning large coal does not vary from the cost of other mills in the same vioinity. Beyond the saving of fuel, the fire is much easier on the boilers, brickwork and fronts of furnaces, no repairs having heen made on any of the above since the arrangement was put in, and the grates are as perfect as when new. This one item almost pays the expense of the entire arrangement. The labor is not neerly as hard on the firemen, and the engineer hae the eteam under entire control. Again, if steam is drawn down rapidly, as in dye worke, it can be brought up again in a quarter of the time.

An Inch of Rain.—Few people can form a definite idea of what is involved in the expression—an inch of rain. It may aid such to follow this calculation: An acre is equal to 6,272,640 square inchee; an inch deep of water on this area will be as many cubio inchee of water, which ut 277,274 to the gallon ie 22,622.5 gallone. Thie quantity weighe 226,225 pounds, or 100.93 tone. One one-hundredth of an inch of rain is equal to one ton per acre.

For hurning sawdust in furnaces, keen grate low; grate surface large; grate hare thin; spaces hetween hars narrow; hegin firing with sticks of wood, then only with sawdust in a very thick layer, and it will burn without difficulty even if wet.

Cleansing Old Iron Water Pipes.—A short time ago the commissioners of Elgin resolved to cleanse the old iron water pipes, and reley them in those parts of the town where they would be of use. The first portion of the pipes (which have beeu in the ground for more thun 20 years, and very much incrusted) hes now heen cleeneed. The process was gone through at New Elgin, where a rough furnace was erected to meet the object in view. The pipes, two at a time, were laid into the furnace, and subjected to an intense heat for about helf an hour. The notion of the heat loosened the incrustation uf the pipes, and when the pipes were lifted out of the furnace the greater proportion of it at once fell off. The most troublesome portion of the work, however, remained to be done. The pipes had to he cleansed with a spring scruper, made to exactly fit the size of the pipe. After undergoing this work, the pipe was allowed to cool till it was in a fit condition to he dipped into a well some 12 feet deep, oontaining Smith's patent solution, where it remained for nearly a minute; after which it was taken out and presented all the appearanoes of a new pipe. By the adoption of this process the town will, it is said, he £300 richer than if the old pipes had been sold as mere metal, and new pipes bought to replace them.—*English paper.*

How "Hard" Water May be Made "Soft."—A late nnmber of the *Popular Science Monthly* contains an interesting article under the caption of "A Piece of Limestone," from which the following paragraph is taken, which contains a hint that may be useful to engineers, as well us to others who may desire to learn a simple process of rendering "hard" water "soft:" "But, though insoluhle in pure water, carbonete of lime is lightly soluble in water which is already charged with carbonic acid; and as all rain water hrings down carbonic acid from the air, it is capable of taking up carbonate of lime from the soils and rocks which it filters; and it thus happens thet all springs and rivers that rise in localities in which there is any kind of celoareous rock become more or less charged with carhonate of lime kept in solution by an excess of carhonic ecid. This is whet gives the peculiar cheracter to water which is known as 'hardness;' and a water hsrd enough to curdle soep muy he converted iuto a very 'soft' water (as the late Prof. Clark, of Aherdeen, showed,) hy the simple addition of lime water, which, hy combining with the excess of carhonic acid, causes the precipitation of all the lime in solution in the form of insoluhle carhonate, which gradually settles to the hottom, leaving the water clear."

Good Health.

American Physique.

I was talkiug the other day with a New York physician, long retired from practice, who, efter an absence of a dozen years in Eorope, has returned within a year to this country. He volunteered the remark that nothing had so impressed him, since his return, as the improved health of Americans. He said that his wife had been equally struck with it, und tha they had noticed it especially among the inhebitants of cities, among the more cultivated classes, and in particuler among women.

It so happened that within 24 hours almost precisely tne same remerk was made to me hy another gentleman of unusually cosmopolitan experience and past middle age. He further fortified himself hy a similar assertion made him hy Cherles Dickens, in compariug his second visit to this country with his first. In answer to an inquiry as to what points of difference hed most impressed him, Dickens said: "Your people, especially the women, look hetter fed than formerly."

It is possible thet in all these cases the witnesses may have been led to exaggerate the original evil, while thiuking it over, and so may have felt some undne reaction on their arrival. Oue of my informants went so far as to say thet he was confident that among his circle of friends in Boston and in London a dinner party of half a dozen Americans would outweigh an equally large English party. Granting this to he too hold a statement and granting the unscientific nature of all these statements, they still indicate a prohability of their own truth until refuted by feots or balenced hy similer impressions on the other side. They are further corrohorated hy the surprise expressed hy Huxley and eome other recent Engliehmen at finding ue a race more suhstantial than they had supposed.

My own impreesion has long heen that nature ie endeavoring to take a new departure in the American, and to produce a race more finely organized, more sensitive, more pliahle, and of more nervous energy; that thie change of type involves some risk to health in the procees, but promieee greater results when the new type should he estahliehed. I am confident that there has heen within the last 20 yeare a great improvement in the physical hahits of the more cultivated classes, at least, iu this country—hetter food, hetter air, better habits ae to hathing and exercise. The great increase of athletic games; the greatly increaeed proportion of seaside and mountain life in summer; the thicker shoes and hoote of women and little girls, permitting them to go out more freely in all weathere—these are among the permanent gains. Tha increased habit of dining late and of taking only a lunch at noon is of itself an eoormous gain to the professional and mercuntile classes, because it secures time for eating and for digestion. Even the furnaces in houses, which seemed at first so destructive to the very hreath of life, turn out to have given a new lease to it; and open fires are heing rapidly reintroduced, as a provision for enjoyment and health, after the main body of the house has been tempered hy the furnace. There has been, furthermore, a decided improvement in the hread of the community and a very general introduction of other farinaceous food. All this has happened within my uwn memory, and gives *a priori* prohahility to the alleged improvement in physique within 20 years.

And, if these reasoninge are still insufficient on the one side, it must he remembered that the facts of the census are almost equally inadequate when quoted on the other. If, for instance, all the young people of a New Hampshire village take a fancy to remove to Wisconsin, it does not show that the race is dying out because their children swell the birth-rate of Wisconsin, instead of New York. If in a given city the births among the foreign-born population are twice us many in proportion as among the American, we have not the whole story until we learn whether the deaths are not twice us many also. If so, the inference is that the sume recklessness brought the children into the world and sent them out of it, and no physiological inference whatever can he drawn. It was clearly estahlished hy the medical commission of the Boston Board of Health, a year or two ago, that "the general mortality of the foreign element is much greater then that of the native element of uur population." "This is found to be the case," they add, "throughout the United Stetes, as well as in Boston."

It seems to me that all our present physiological tendencies are rather favorahle than otherwise, and that the transplantetion of the English race seems now likely to end in no deterioration, hut in a type more high-hred, more finely organized, and also more comprehensive and cosmopolitan. All this without loss of health, of longevity, or of physical size and weight. And, if this is to hold true, it must he true not only of men, but of women.—*T. W. Higginson, in the Woman's Journal.*

Accidents to the Eye.

Particles of cinders, dust, or fragments of metal, often get into the eye, and cause a good deal of trouhle. Sometimes they are dislodged, and washed out hy the extra secretion of tears brought ahout hy the irritetion produced hy the hody. Sometimes this process does not give relief, and it is necessery to resort to some process of extraction. A popnlar, and often useful plan is to take hold of the lashes of the upper lid, separate it from the eyeball, so that the lashes of the lower lid will slip up in the space, acting as a hrush to the inner surface of the upper eyelid. This, of course, cannot remove anything, as a rule, from the eyehall. A hetter way is the usual one of holding a knitting-needle over the upper lid, close to and just under the edge of the orhit, then, holding it firmly, seize the lashes of that lid hy the fingers of the disengaged hand, and gently turn the lid upward and hackward over the needle, or substitute used. Movement of the eyehall hy the sufferer, in a strong light, usuelly reveals the presence of the intruding hody, so that hy means of the corner of a silk or cambric handkerchief, it can be detached and removed.

Should the foreign body be imbedded in the mucous membrane covering the eyehall or the eyelid (conjunctive), a steady hand and a sharp pointed instrument will usually lift it out.

The foreign body often cannot be seen, hut the person assures us that he feels it. Often he does not reelly feel the presence of the hody, as much as the roughness (really, a wound) left hy it. In such a case, or even if the hody has heen seen and removed, a soothing application to the injury is as useful as the same thing applied to a wound of the hend. Take a spoon or cup, heat it, and pour iu a few drops of laudanum. It will soon hecome dense and jelly-like. A few drops of water added will dissolve this gummy material, and the liquid thus formed may he applied hy the finger to the 'inside of the eye" as they say. The laudanum is opium diseolved in alcohol. The alcohol is somewhat irritating, hut is easily evaporated by the gentle heat, leaving an extract of opium, which is dissolved in the water afterwards added.

The comfort derived from this simple and always accessible preparation, after the injury to the eye hy a foreign hody getting into it, is of the most satisfactory kind. In no case nee any of the popular "eye waters," or "salves."

Not an uncommon accident is a fragment of lime in the eye. The delicacy of the organ, and the activity of this powerful alkali, require all that ie to he done to be done at once. Do not waste time hy attempting to pick it out, but neutrelize the alkali by a few drops of vinegar (which is dilute acetio acid) in a little water. A few drops of lemon juice, in a little water, will anewer just as well, if introduced, like the vinegar, into contact with the lime. Even when done rapidly, the ulceration caused hy the alkali will he some daye in disappearing. In all cases where lime hee entered the eye, even when these things have been used, no time should he lost in going to a surgeon.

MINING AND SCIENTIFIC PRESS

W. B. EWER.....SENIOR EDITOR.

DEWEY & CO., Publishers.

Four weeks are rated a month.

Large advertisements at favorable rates. Special or reading notices, legal advertisements, notices appearing in extraordinary type or in particular parts of the paper inserted at special rates.

SUBSCRIPTIONS payable in advance—For one year, $4; six months, $2.25; three months, $1.25. Remittances by Registered letters or P. O. orders at our risk

SAMPLE COPIES.—Occasionally we send copies of this paper to persons who we believe would be benefited by subscribing for it, or willing to assist us in extending its circulation. We call the attention of such to our prospectus and terms of subscription.

THE ORIGINAL ARTICLES in this paper are mostly set in solid type, giving in our columns one-third more reading than is contained in ordinary leaded matter.

ADDRESS all letters to the firm, and not to individual members, or others, who may at any time be absent from our office.

Our latest forms go to press on Thursday evening.

San Francisco:

Saturday Morning, Nov. 4, 1876.

TABLE OF CONTENTS.

GENERAL EDITORIALS.—Improved Hand Fire Engine and Hose Carriage; Paul's Dry Process, 297. Prospecting Mines; The Candelaria Mine; Remarks on Quicksilver, 304. Comstock Papers; Red-Headed Wood-Pecker, 305. A few Notes from Utah; Mechanical Ore Concentration and Separation; Notices of Recent Patents, 308.

ILLUSTRATIONS.—Improved Hand Fire Engine and Hose Carriage, 297. Red-Headed Wood-Pecker, 305.

MECHANICAL PROGRESS.—Pointe on Incrustation; Cost of Steel Rails; To Secure Perfect Round Bars; New Steem Navvy; Large Plate of Cast Steel; English and American Lathe Work, 2-9.

SCIENTIFIC PROGRESS.—A New Earthquake Theory; On Moleculee; Science in England and France; Lunge's Process of Making Spongy Iron, 299.

MINING STOCK MARKET.—Sales at the San Francisco, Pacific and California Stock Boards; Notices of Assessments; Meetings and Dividends; Review of the Stock Market for the Week, 300.

MINING SUMMARY from various counties in California, Nevada, Arizona and Colorado, 301-2-8.

USEFUL INFORMATION.—Hints for Grainers; Coal Dust Fuel; An Inch of Rain; Cleansing Old Iron Water Pipes; How "Hard" Water may be Made "Soft," 303.

GOOD HEALTH.—American Physique; Accidents to the Eye, 303.

THE ENGINEER.—The Isthmus Canal; A New Style of Tunnel; Communication with Central Africa; Telegraph Extension in Africa; Novelty in Marine Architecture, 302.

GENERAL NEWS.—General News Items and Miscellaneous Paragraphs, on 308 and other pages.

MISCELLANEOUS ARTICLES.—Pacific Coast Railroad Notes; Another Big Shaft on the Comstock; The Paris Exposition; The Silver Commission; Tuscarora District; Pontoone; Holcomb and Bear Valley Mines; A Queer Discovery; South Cometock, 298. Telephony; Change of Superintendents, 302. Agricultural Experiments, 303.

A *Pioneer-Press* special from Bismarck says: General Miles had a successful fight after an unsuccessful council with Sitting Bull on the 21st and 22d on Cedar creek, killing a number of Indians. His own loss was two wounded. He chased the Indians about 60 miles, when they divided, one portion going toward the agencies and Sitting Bull toward Fort Peck, General Miles following. General Hazen has gone to Fort Peck with four companies of infantry and rations for Miles. Sitting Bull crossed below Fort Peck on the 24th, and had sent word to the agency that he was coming in and would be friendly, but that he wanted ammunition.

A COMPANY being formed in this city proposes to apply the district telegraph system of summoning messengers to an economical system of providing hacks and turnouts. A central carriage house will be established, with branch houses in various parts of the city, and carriages will be kept in waiting with coachmen in livery, ready at a moment's notice to respond to a summons. The charge per trip to the theater, or on any reasonably short journey, is not to exceed 75 cents.

THERE are now 108 deep-water vessels lying at the port of San Francisco Of this number 77 are ships, 26 barks, 1 brig and 4 schooners. The fleet going and coming to this port numbers nearly 500 vessels. Of the vessels now in port 54 fly the British flag, 5 fly the German, 2 the Norwegian, the French, Nicaraguan and Colombian flags ornament one vessel each. All the others, nearly one-half, flaunt the stars and stripes.

SEVEN large new canneries are in process of construction along the lower Columbia. Should the next fishing season prove favorable, more salmon will be caught and prepared for shipment than has ever before been done in any one year.

Prospecting Mines.

It may be stated as an axiom in mining matters, that always before starting reduction works, the mine itself should be opened in several places. The more thoroughly it is prospected the better, in order to be assured of a permanent supply of ore. We make this observation, so elementary in its nature, because we have observed that many persons have a false idea of metallic veins. They seem to think that a vein once opened should yield ores of a nearly uniform richness and do so uninterruptedly.

There is in this idea a very great mistake. Nature does not work with the uniformity which would be agreeable in this connection. A vein may "pinch," or may become quite poor without ceasing, on that account, to be valuable. It may remain barren for some time and then become more productive than ever. It is for want of taking into account these irregularities, not at all alarming in themselves, that we see, in the stock market and even in the mining districts, where they should know better, the stockholders seized with sudden panic. At a poor streak the stock of the unfortunate mine falls to a nominal price, and then on the first indication of ore as suddenly rises.

There is not one of our good mines which has not given numerous instances of this kind—pleasant, it is true, when the stock rises, but often disastrous when the reverse is the case. It is on account of these accidents so common, and even, we may say, so inevitable, that we recommend, when practicable, the opening of the veins in different places. When this is done a richer part may supply the deficiencies of others momentarily impoverished, and sudden fluctuations in value, in a measure, be checked.

The great difficulty is in newly opened mines where there is little capital to expend, a simple shaft or tunnel is considered sufficient to prove the worthlessness or value of the mine. But, where large companies go to work, they should in all instances take the money usually expended so lavishly in reduction works and prove their mine first, after which, if the mine is worth it, money will always be forthcoming for the works. So many mistakes of this kind have been made and so many thousands of dollars lost by a foolish policy, that it is the duty of the journalist to point out where the errors are made and, as far as he is able, endeavor to correct them.

One trouble is, that frequently when a little money has been expended on a single shaft and the prospects are doubtful, the owners become discouraged and give up the whole work, for fear of sinking money uselessly. This is of course judicious in some instances; in others it is sheer folly. A 30 or 40-foot shaft proves very little; but often, if a rich streak is struck in that distance, work will cease in the mine, big works be put up at great expense and every preparation made for carrying on operations on a large scale. Whereas, should poor ore be found the whole thing will stop from lack of confidence. Both of these methods are foolish; the rich ore may give out in a few feet, as may the poor; but were the mine properly prospected before much expense was incurred for works, the managers could determine on future movements with better judgment.

As an instance of how easily men may be discouraged in mining when everything is not as they hoped for, we may recall a circumstance in our recollection which occurred in the gravel mining region. A miner who had worked in the district in its palmy days had a cherished idea that under a certain hill ran the rich pay channel, which had been worked out in other mines and lost. As the district declined in prosperity he got a party of other miners, out of work, to sink a shaft with him over the place where his theory placed the channel. They worked off and on for some time and at last reached the gravel in the bottom of their shaft. It was very poor, and the prospect in the pan was so bad that they gave up in disgust without drifting a foot either way from the shaft. The miner who organized the undertaking, though not discouraged, had no one to help him and left the district. A few years after he explained the theory he had of the channel to some other people, who, having faith in his judgment, advanced the money necessary to run a tunnel into the hill to prospect the channel. This time work was undertaken systematically and carried out properly. The channel was struck and struck rich, and the mine has paid its owners very handsomely for several years, with every prospect of continuing to do so for some time. In the course of the work a drift was run out towards the old abandoned and caved-in shaft which had been sunk several years before, and about four feet from the bottom, where the previous prospectors had quit work, a pocket was struck which yielded over one hundred thousand dollars in gold. Had the men who first took hold of the enterprise not become so suddenly discouraged at their poor prospect, and at least prospected a little, they would have reaped a rich reward. It was found out in the course of operations that the poorest gravel in the claim was at the bottom of that old shaft, and had it been sunk a few feet either way from where it was, the result would have been entirely different. This illustration, one of the many which could be cited, only serves to show that a single spot in a claim, whether quartz or gravel, is not sufficient to prove its value, and that in all instances, where practicable, more extended operations should be carried on before approving or condemning a mine.

The Candelaria Mine.

The Candelaria mine, in Durango, Mexico, is one of those rich old Mexican mines, from which immense sums were taken out by the original owners who worked it a hundred years ago, but which never paid much after it fell into the hands of the American owners. This mine is owned by a New York company, who have worked it for almost 13 years, but never realized anything from it, although they are now likely to do so, as ore has been struck in the tunnel, the face of which is within about 350 feet, as near as can be calculated, of the spot where the richest ore was found by the Mexicans.

It is known that upwards of $50,000,000 were taken from this mine by the old Mexicans, but during some legal difficulty the mine was temporarily shut down, and filled with water, which the Mexicans never could get out. It was finally abandoned and left in that condition until the New York company in 1863 purchased the property and commenced work. The upper works were caved in and operations have been carried on in a desultory manner on different parts of the mine with but poor success. At best the Mexican miners will only work about five days in the week, and then numerous holidays even lessen the average. Bad ventilation has bothered the company and several times the enterprise came near being abandoned. The facilities of transportation are very bad and articles ordered in March, for instance, would not arrive at the mine until June. The history of this mine has been like most others worked by Americans or English in Mexico, all sorts of obstacles, unknown elsewhere, being interposed to prevent active operations.

Some work in running drifts on towards the old works has been done, but proved unsatisfactory. It was found that there was about 400 feet of water in the mine and that such extensive caves had taken place as to greatly hinder operations. It was resolved to do most of the work on a tunnel which would drain the mine. This tunnel was originally started by the Mexican engineer Garcia in 1810, but it was abandoned after 125 feet had been run. The New York company took hold of the tunnel in October, 1863, and have now only got in 1,250 feet. As may be seen by this, progress has been very slow in prosecuting work.

This tunnel, however, will effectually drain the mine to a depth of 900 feet from the highest croppings, and admit of the owners' working the ore where the Mexicans quit work. From the open cut on the hill to the bottom of the old workings is about 1,000 feet in depth. The tunnel run in 513 feet and struck the vein, then followed the vein 737 feet. Small stringers have been cut once or twice, which yielded well; but advices from there just received state that at last good ore has been struck in the heading. The 30 feet run through this ore body proves it to be no mere stringer, for it improves as entered upon. This will be good news to the New Yorkers who have waited so long for a return on their investment. It is estimated that the heading is now within about 350 feet of the center of the old mine, and the old ore body may be struck any day. The drilling is done by hand and only two men work in the face at a time, so that progress is necessarily slow. The vein itself varies from 30 to 60 feet in width, the pay ore being mainly next to the foot wall.

We have been shown plaster casts representing the spur in which this mine is situated, and also showing a section of the mine with the old and new workings, made by Mr. Temple, father of Mr. A. V. Temple, the present engineer of the mine. Drawings, maps, etc., having failed to give the New Yorkers a correct idea of their property, these models have been made and will be sent to them. They were made from data collected by the present and former engineers of the mine—Dahlgren, Rice and Wiedner. From these surveys sections for each 100 feet were made. Mr. Temple marked out these sections on a board, and with a fine saw cut the boards at the marks. The pieces of board were then put together and covered with clay, which made the model from which the cast of the "spur" was made. He then sawed through on a line with the vein, which gave a section of that. On the section are marked the cuts, drifts, shafts, winzes, etc. The details of old workings are somewhat indefinite of course, but a good general idea is given. The location of the tunnel is also shown. This idea is a good one and might be followed to advantage by many superintendents, as nothing gives so good an idea of the workings of a mine as a good model made to a scale.

GEORGE CUNNINGHAM, boss timberman of the Lady Washington mine, was killed on Monday by stepping into a compartment in the shaft just as a cage was coming down.

Remarks on Quicksilver.

[Written for the PRESS by SAMUEL PURNELL.—No. 4.]

The Usual Forms

Of condensers are simply large chambers, kept cool by water, in which the fumes are cooled below the boiling point of mercury, wherein such globules as are large enough to fall by their own weight are collected. This idea is carried out with many different forms, and such forms answer a good purpose for ores of moderate richness when the price of quicksilver is high, but they will arrest so small a portion of fumes from poor ores (for reasons already stated) that the smelting of such is unprofitable. In the hope to save these fine particles the chambers have been enlarged and multiplied, the currents of gases copiously watered or conducted in long and circuitous passages, the gases have also been passed through coke columns, into glass houses, etc., but all to little improvement. The small particles are still lost. These difficulties are so formidable, and there seems to have been so little success in meeting them, that some quicksilver men have despaired of ever finding a remedy, inventors and experimenters have ceased to invent and experiment, and the general conviction seems to be that, though the present manner of condensing is unscientific and barbarous, no relief is to be expected. At a European works quicksilver was found 10,000 feet from the condensers for a foot deep in the ground. A writer says (SCIENTIFIC PRESS, vol. 27, page 210): "The present wasteful and unsatisfactory method of treating cinnabar demands an entire change, more than half the mercury in the ore being lost to commerce. Why cannot science be brought to bear on this work as well as in the treatment of other ores?" Contrary to general practice, he claims that great space for condensation is not necessary, but that *coldness* was the main thing needed. This writer caught a faint glimpse of the true principles of condensation, but he was not able to follow up the idea.

To the author of this article it would seem that the

True Plan of Condensing

Poor quicksilver fumes rests with the adoption of a somewhat novel principle. Bearing in mind the difficulty, not to say impossibility, with present apparatus, of causing the very small and minute floating particles of mercury to cohere and unite to a mass which shall have sufficient size and weight to fall through the gaseous current, we shall see that to ensure success in condensation, we must depart from the old principles and forms and adopt a new principle and apparatus that will cause the uniting of these atoms and globules as they float in the gases. To accomplish this would seem to be simple. The vapors should be first cooled to about the usual degree, and then subjected to a violent rotary and compressing motion, within a closed chamber, that will cause the small particles to strike each other and cohere. This is a principle of Nature, and it must prove a success; it is illustrated every day in our atmosphere. The minute atom of watery vapor floating in the air does not fall in the shape of rain until the numberless small ones in company with it are cooled, agitated, rotated and compressed by the wind. The storms then roll along in spirals, each one aggregating others to itself, till soon enough have combined together to form a globule or drop of sufficient size and weight to fall through the air as a rain drop. Herein, then, lies also the

True Principle of Quicksilver Condensation,

And which will, sooner or later, be recognized as the only natural and complete one. For purposes of experiment an apparatus exemplifying this principle could readily be attached to the outlet of the ordinary condensers, where it would soon prove its utility.

The author does not claim any originality in mentioning this new principle of condensation. A short time since he was consulted upon the application of it to the condensation of quicksilver fumes, and the mechanical means to carry it into effect, by Mr. William H. Sterling, of San Francisco, who has applied for a patent on the principle or process, and for several forms of apparatus to operate it. The author was so far pleased with the invention that he has been much interested in its progress, and feels that he can safely advise those interested in quicksilver mines and furnaces to examine into it, and give it a fair trial, as he is confident that an apparatus constructed on the above principle (the *form* of which may be varied almost indefinitely) would at once relieve all the remaining difficulties of condensation, and enable poorer ores to be profitably worked than ever before, with but a probable loss of mercury in the condenser of less than 10 per cent. The expense of construction promises to be very much less than that of any of the forms of condensers heretofore in use.

Referring again to the object of this communication, this new principle of condensation is advanced in order to call the attention of quicksilver men to a most promising invention, and which seems likely to aid in the solution of the heretofore difficult problem of condensing fumes from poor ores, and to prevent the threatened extinction of this industry.

THE debt statement shows a reduction during October of $3,388,139. The amount of coin in the Treasury is $15,967,027; currency balance, $12 901,326; special deposit, $40,670,000; coin certificates, $33,283,100; outstanding legal tenders, $367,535,716.

No. 8.

The Washoe Pioneers and Their Successors—Herman Camp and His Eccentric Fortunes.

Very unlike the men spoken of in the last number of these papers—the original locators of the Comstock lods—were their immediate successors, the parties who bought them out, paying what were at the time considered extravagant prices for their claims. Foremost among this more shrewd and better educated class of men was Herman Camp; not that he was the first to secure through purchase permanent ownership of a portion of the rich deposits on the great mother lode, this distinction being due to James Walsh and Joseph Woodworth, but Camp was the first to effect such a purchase, agreeing to pay for the interest secured a price denoting something like a proper appreciation of the worth of the new-found silver mines. Arriving in Washoe towards the latter part of July, 1859, Camp, who was a man of quick perception and possessed of a bold and speculative turn of mind, took in the situation at a glance and forecast the future of the country with wonderful correctness. He estimated the new ore find as being of the first importance, and rightly divined that an active mining industry would here grow up, requiring costly reduction works and a considerable town for its accommodation. Impressing these views upon other parties possessed of more money than their sanguine and eloquent adviser, he readily induced them to give him a contract for putting up a number of stone buildings in close proximity to the mines, no town site having as yet been laid out.

A Persuasive Talker.

Camp was not only an active, wide-awake sort of person, but a most persuasive talker; the fact that he succeeded in causing Comstock at their first interview, to deed over to him his entire interest in the Ophir ground for a moderate consideration, only one dollar of which was paid down, being sufficient evidence of his power in this respect. This transaction took place on the 6th of August, on which day the purchaser was duly installed into the premises and commenced taking out ore from the excavation already opened. That night Comstock, meeting with his companions, was so much badgered on the foolish bargain he had made, that he concluded, with their promised assistance, to go at once and take possession of the claim which he had, by a legally executed deed, transferred to another party, then in lawful and peaceable occupation thereof. This was accordingly done, and when Camp came in the morning to resume work he found the pit in the possession of an armed gang of ruffians, who threatened him with instant death should he attempt a forcible re-entry upon the ground.

A Fatal Mistake.

Being an eminently good natured and peace-loving man and feeling that he could by no possibility be in this manner ousted from his claim, Camp proposed that the matter he referred to a jury of miners, agreeing to abide by their decision in the premises, a proposition that his adversary readily acceded to, well knowing that he could give to this assemblage such a moral complexion as would insure a decision in his favor. The friends of Camp cautioned him against pursuing this course, pointing out the danger to which he would be exposed in doing so. Dr. Henry Degroot, who had long been acquainted with, and knew him to be an energetic, honorable man, well while and likely to perform all he had undertaken in his contract with Comstock, advised him strongly against submitting the question of his right to retain the ground to any such sort of arbitration, urging him to go at once to Genoa, the county seat, and put his deed on record, and then, if in fear of personal harm, to leave the country, trusting to the courts for the vindication of his rights, and the ultimate restoration of his property.

Not wishing just then to go away, and confident that but one result could be reached by the proposed tribunal, Camp preferred to submit to them the matter for settlement. As had been foreseen, this meeting, when it came to assemble, was made up mainly of Comstock's old cronies, a whisky-sodden set, who having already prejudiced the case, decided as a matter of course against Camp, who, in accordance with his pledged word, surrendered his deed and gave up the contest. In relinquishing his claim to this property the acquisition of a splendid fortune was defeated when already within his grasp. Camp afterwards acquired large interests in the Gould & Curry and other valuable ground on the Comstock lode, and but for attempting to carry too much and sometimes holding on too long, might have come out largely ahead; as it was his Washoe experiences benefited him but little in the end, his wealth when he came out having been reduced to the zero point, about where it stood when he started in.

James Walsh and Joseph Woodworth.

As already stated, these gentlamen bought no mining ground on their first visit to Washoe, which occured in the latter part of June, 1859. At that time their attention was mainly occupied with the mines at Gold Hill, the rich and easy working ores of which induced them to put up a series of arastras on Carson river for their reduction. Comstock had on various occasions importuned them to purchase his mining interests, but not until the 10th day of August did he succeed in making a sale to these partiss, the conditions of which have in these papers heretofore been mentioned. They also soon after bought into several other claims, ranking before the end of 1860 among the largest mine owners along the Comstock. During that year Judge Walsh parted with the greater portion of his interests, realizing fair but not extravagant prices therefor. Woodworth, who held on to the most of his, became very wealthy, being able at one time to sell out for a million of dollars. Extending his operations at a period when labor and material were enormously high, and the methods of ore reduction were as yet both costly and imperfect, he met with heavy losses, and finally retired from Washoe with but a remnant left of his once large fortune. Judge Walsh, who undertook to treat the refractory ores of White Pine and other interior districts, erecting expensive smelting works for that purpose, also lost much money, coming out of the country where he had at first succeeded so well, with an exchequer even more seriously depleted than that of his enterprising confrere.

RED-HEADED WOODPECKER.

Among the Men Who Became Largely Interested in the Comstock Mines.

Almost at the start, visiting them in person or purchasing on the representation of others, the following embraces perhaps a tolerably full list: Donald Davidson, after whom, because of the active and intelligent interest he took in the developement of the new silver bearing region, the most conspicuous peak in the Washoe range was named. General Allen, partner with Donald Davidson in the purchase of Ophir, the two being early and quite extensive buyers into that ground. George Hearst and William Morrison, the latter being for a time at first superintendent of the Ophir, William M. Lent and B. F. Sherwood, owning and afterwards operating jointly and pretty largely in Washoe properties. Richard Ogden and J. Downes Wilson, who bought freely at the opportune moment and, through judicious management, made a good deal of money, some of which was afterwards sunk in the erection and running of a mill, a perfectly legitimate but not at that day always profitable line of business. Erastus Sparrow and Joseph French, who bought the French & Sparrow ground at Gold Hill and soon after put up a large mill on the American ravine, which from the first proved and has for many years since been run as a successful concern. John O. Earl, Andrew B. McCreery, Alpheus Bull, all of whom got a good financial send-off through fortunate investments in Comstock ground. M. C. Hillyer, Henry G. Blasdell, afterwards Governor of Nevada, A. D. Perkins, Hiram Pierson, William F. Bryant, Louis Schloss, J. McKinty, E. S. Gross, William N. Thompson, H. H. Raymond, extensively engaged in ore reduction, with a disastrous ending; the man who long and worthily bore the most exalted of all titles, "Honest" John Atchison; J. Neely Johnson, Frank M. Pixley, who made the journey over the mountains on his famous mule in midwinter, bought and, what was equally important, sold at the right time, adding materially to his already quite large and fairly earned wealth. There were, doubtless, others whose names should be included in this list, though we cannot just now recall them to mind.

Dons With Earth

Of the persons here enumerated the following are deceased, nearly all of them having died with fortunes considerably reduced and some of them quite poor: Herman Camp, Donald Davidson, B. F. Sherwood, E. Sparrow, E. S. Gross, William N. Thompson, H. H. Raymond, John Atchison and J. Neely Johnson, the two last mentioned having died at Salt Lake City, where they had gone, the first to look after mining, and the other to attend to some legal affairs.

British Columbia Mines.—Advices from Fort Wrangel, dated September 30th, state that a large number of miners are waiting at Wrangel for steamers to bring them to Victoria. It is supposed there are 500 men yet to come down. The weather was fine at the mines, and a large number of claims were being worked. Several creek claims on Dease creek were paying well, and it is thought from prospecting that good hill diggings exist on that creek. Several good benches have already been discovered. Good hill diggings have also been found on Thibet creek. The prospects on Rosalie creek are encouraging, and a large number of claims will be thoroughly prospected next season. The yield of gold from the Cassiar mines is not so large as last year, but they are by no means worked out. Many of the old hands will return next season. Magnetic iron ore, with deposits of coal, fire-clay and limestone, have been discovered on the east coast.

Red-Headed Wood-Pecker.

The red-headed wood-pecker, shown in our illustration, is well known throughout the United States. They prepare their nests in the large limbs of trees, adding no materials to the cavity which they smooth out for the purpose. Sometimes several perforations are found in the same tree; but living trees are seldom occupied by them. The same tree is employed for years in succession by a pair of these birds. The eggs, usually six in number, are white, marked at the largest end with reddish spots, in which last particular they differ from all others of the genus.

The mocking bird alone exceeds this woodpecker in gaiety and frolic. It everywhere finds abundance of food and facilities for raising its broods. It is not much afraid of man, and will retreat but a short distance at a time from him, or even simply run around a tree or stalk, and peep from behind it at him; and this notwithstanding that man is its most dangerous enemy. So abundant and fearless are they at times in the Eastern States that a hundred have been shot in a day upon a single cherry-tree; for they not only feed upon the ripening fruit, but destroy immense quantities, even to the stripping of them. Pears, peaches, apples, figs, mulberries, and even peas are thus attacked. The corn, also, both when young and juicy and when near maturity, is a subject of their depredations. They also invade the abodes of pigeons, martins, and other birds, for the purpose of sucking their eggs. When their hunger is satisfied they are excedingly playful, chasing each other from tree to tree in curving sweeps, or following insects upon the wing. When they alight upon the ground they are quite agile, securing with ease the beetles seen from their perch. When the fruit is all gone their facility in detecting insects under the bark of trees is remarkable. Alighting upon the trunk one of them will stand motionless for a few moments; then he will strike the tree with his bill and again listen until he hears the motion of an insect or larva within, when he perforates the bark and devours his prey. In the season of ripe fruits their flesh is esteemed by many as rich food.

As a means of protecting fruits a bare pole is placed beside a tree, and reaching a little higher than its summit. Upon this the bird alights by preference, when a blow given to the pole below will produce such a vibration as will cause the bird to fall dead. In this connection we notice that Mr. Ralph Carr Ellison, of Durham, England, in an English journal, stating his success in expelling birds during the fruit growing season from his gardens by means of common cheap fire crackers and squibs, says: "My gardeners make use of a few, in different quarters of the ground, early in the morning; one or two occasionally during the forenoon, and then a more liberal discharge at three or four o'clock in the afternoon, when the birds again desire to feed. The sulphurous smoke that issues from the smoldering paper long after the reports are over deters the enemy by the scent of gunpowder and fear of fresh explosions far more effectually than would be supposed.

Items of Interest from the Mines.

In the Silver Hill mine the pump and column to connect the 444 foot station with the new water tank below the 650-foot station is all put in.

The superintendent of the Steptoe mine says: The ore body in Ready Cash is rapidly increasing in dimensions, and I am satisfied that in a week we will have as large a body of ore as any in the district. As I have stated before, this ore is not of a high grade, but will sell on the dump for from $10 to $20 per ton, and as it is of a soft character and cheaply mined, a large profit can be realized at these figures.

The developments in the Herald are quite flattering. The ledge in the bottom of the incline is four feet wide. The indications now are that the whole space between the two walls is fast filling up. The foot and hanging walls are six feet apart.

The furnace of the Modoc Consolidated is turning out from 100 to 110 bars of bullion per day.

The ore development in cross-cut number three, 800-foot level, of the Justice has very much improved.

The Silver City *Reporter* of October 29th says: "Superintendent William B. Gibbons, so well and universally liked here, has resigned the superintendency of the Brunswick mill, on the Carson, and Mr. Ross LaValliere of the Morgan mill has been appointed in his place. Superintendent Gibbons is one of the ablest mill men on the Comstock, and the Brunswick mill the boss mill on the Carson. We are sorry to see them separated."

A large blower is being put in the 1500-foot level of the Consolidated Virginia to reduce the heat on the 1700-foot level.

Work has again been commenced on the south drift, 1700-foot level, of the Gould & Curry mine.

The water is now out of the South Comstock mine, and a cross-cut has been started for the east ledge on the 300-foot level.

At Gold Run, Placer county, the Miners' ditch company is having a new string of extra heavy large pipe made to convey water from the ditch down into the Indiana Hill claim.

ISSUED OCT. 1st, 1876.

Testing and Working Silver Ores.

The above is the title of an illustrated work of 114 pages, for miners and prospectors by Chas. H. Aaron, which has just been issued by Dewey & Co. Mr. Aaron has managed to give many useful hints and suggestions, free from all technicalities, and in such a style as to be easily comprehended. It is written for the miner, with no chemical symbols or metallurgical technicalities to confuse those who are not chemists or metallurgists. The following summary of the contents of the work will give an idea of its scope:

Under the heading of the first chapter, "Testing Ores for Silver," we find paragraphs on ore formation, test for silver, with heat and water, acid or blow pipe. In speaking of testing for a process, the extent and richness of ore is considered, smelting ores, selecting and working sample, appliances for testing, roasting, etc. Under the head of "Working Ores" the author describes Aaron's process, has something to say of superheated steam, preparation of dichloride of copper and protochloride of copper, use of copper and iron, quantity of chemicals, carbonate of lime, chloride ores, amalgam, Patchen's process, etc. He also describes the methods of working roasted ores, treatment of base metals, stirring, heat of furnace, want of sulphur, etc. Under the head of "Leaching Processes" are the titles, Smelting, Mexican process, Kroencke's process, Chilean process, etc. Under "Pulverizing Machines" are described the arastra and its construction and operation, stamp batteries, screens, Crocker's trip-hammer battery, Paul's pulverizing barrel, Kendall's battery, Noice's pulverizer, a cheap rock breaker, etc.

In speaking of amalgamators the author describes a cheap amalgamator, grinding the ore, directions for making a barrel, preventing mechanical wear, use of quicksilver, copper in bars, Freiberg barrel, cheap barrel, trough, barrel on rollers, Aaron's amalgamator, separator, etc.

He describes an improved retort, roasting furnace, furnace tools and furnace building. Among the miscellaneous mention may be found Aaron's leaching apparatus, with two or three different arrangements a small mill, sampling tailings and settling tanks, dichloride of copper, etc. Mr. Aaron is a practical miner of long working experience on this coast.

The book is a serviceable one for miners' and prospectors' use. Price, post free, (in leather,) $2.00. Address Dewey & Co., MINING AND SCIENTIFIC PRESS, 224 Sansome street, San Francisco.

The Large Circulation of the MINING AND SCIENTIFIC PRESS extends throughout the mining districts of California, Nevada, Utah, Colorado, Arizona, Idaho, Montana, British Columbia and to other parts of North and South America. Established in 1860, it has long been the leading Mining Journal of the Continent, its varied and reliable contents giving it a character popular with both its reading and advertising patrons.

Superior Photographs.

To be sure of a good picture, you have only to patronize G. D. Morse's Palace of Art, at No. 417 Montgomery street, S. F. The publishers of this journal have patronized Mr. Morse for many years, and do not hesitate to say that his pictures are not excelled by any we have seen produced in this or any other country. No one can ask for a better man to patronize than Mr. Morse. He is affable and respectful to all.

Newspaper Fileholders.

Dewey's new elastic fileholders (black walnut), size of the PRESS, *Harper's Weekly* and *Scientific American*, for 50 cts. Larger sizes, to suit any newspaper, 75 cts. By mail, postpaid, 10 cts. extra. Cash with all orders. Patent allowed. Address, DEWEY & Co., Publishers, San Francisco.

BOUND VOLUMES of the MINING AND SCIENTIFIC PRESS from Jan. 1st, 1864, are for sale at this office at $5 per volume, two volumes a year. Unbound at $3 per volume.

SEWING MACHINES.—We have a first-class machine we wish to dispose of on favorable terms. Apply at this office.

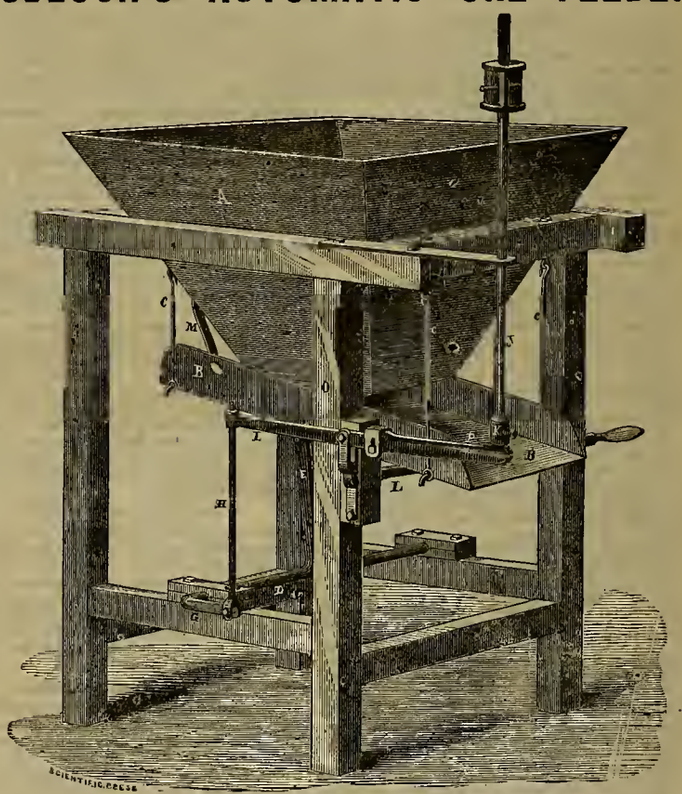
TULLOCH'S AUTOMATIC ORE FEEDER.



The TULLOCH AUTOMATIC ORE FEEDERS have been practically tested during the last year and a half in 40 mills, of from five to 80 stamps each, and have, in every case, given perfect satisfaction. The Tulloch machine is so constructed that the drop of the stamp feeds the ore in just such quantities as the stamps require. Each drop regulates the supply required for the next drop, whether it be more or less, and this is the true principle of an automatic feeder. The tray moves longitudinally, and a stationary scraper forces the material forward at each backward movement of the tray, thus insuring the perfect feeding of all classes of ore, whether it be dry or wet.

We append a few extracts from the many testimonials which we have received from mill men and practical mining men, of the effectiveness and positive action of the Tulloch Feeder. We do not depend solely upon these testimonials, as we are aware that testimonials are easily secured for almost any machine, but the high character of the parties certifying to those herewith given, will establish their value and genuineness:

Mr. Jas. G. Fair has 28 in use; says: I regard them superior to any Feeder with which I am acquainted; I consider no mill perfect without them. Mr. E. R. Burke, Sumner mine, Kern county, has 16: They never get tired; no man living can feed a battery as well; they save us in labor alone $48 a day. Mr. Green, of the Phœnix mill (12), Amador, writes: The first machine we had is working away; is as good as ever; have not spent a dime on it; in use 14 months; you need fear no competition on wet ores. Mr. W. H. Armstrong, of Consolidated Virginia mill: We are running 60 stamps with your Feeders; they give unbounded satisfaction; they have not cost the company one dollar since starting up. Mr. H. C. Bidwell, Supt. Green Mountain and Gold Stripe companies, Plumas county, writes: From the start they have done splendidly; no trouble whatever; requiring but little attention; a boy can manage them; the saving in both labor and castings is fully one half over the old style of feeding by hand. Mr. Preston writes: I have four of your Automatic Self Feeders, and my mill men each and all say they are the best they have ever used. They are an improvement on all I have ever seen, being simple in construction, and good for either wet or dry crushing; refer to over 40 mills using them; they are guaranteed to give perfect satisfaction. Send for circulars.

F. OGDEN, 417 Market Street, S. F.

San Francisco Cordage Company.

Established 1856.

We have just added a large amount of new machinery of the latest and most improved kind, and are again prepared to fill orders for Rope of any special lengths and sizes. Constantly on hand a large stock of Manila Rope, all sizes; Tarred Manila Rope; Hay Rope; Whale Line, etc., etc.

Arizona.

MINING OPERATIONS.—Cor. Arizona *Miner*, Oct. 20: In mining the only operation worthy of notice is the Trench mine, 80 miles east of soutb, and the Yellow Jacket, 75 miles southwest of Tucson. The Trench is owned by Messrs. Archibald, Gardiner and Hopkins, and is one of the finest argentiferous galena lodes I have ever seen. It is first-class smelting ore, and was worked 100 years or more since by the old Jesuit Fathers. The ore averages $80 per ton in silver, and selected goes well up into the hundreds. The workings are two tunnels, of 200 and 300 feet, and several shafts, the deepest being 120 feet. The vein matter is seven feet wide, running east and west, and the lode has been traced and located over 20,000 feet. Fifty men are employed, of whom about one-third are whites and the rest Mexicans. Two Mexican furnaces are in operation, and two new improved ones will be in operation the coming week with prospects of eminent success. The Sea Serpent lode is 70 miles southwest from Tucson, another immense lode, traced and located for some 20,000 feet, the vein running northeast and southwest. The Emma mine, on this vein, owned by Thos. Ewing & Co., shows vein matter from 10 to 30 feet wide, and the ore assays from $50 to $800 per ton, and selected as high as $5,000 per ton. This mine is eight miles West of the old Cerro Colorado mine, and 15 miles north of the Sonora line.

THE Yellow Jacket mine, on the Ostrich lode, is 75 miles west of south from Tucson, and gold bearing. The owners, Dr. Handy, Bartlett & Co., are working this mine successfully, having a 10-stamp mill, and employing 40 to 50 men. The vein matter is 12 feet wide with a pay streak of over three feet, which works $20 per ton; depth of shaft, 60 feet; length of tunnels, 20 and 30 feet. They have also a parallel vein, 20 feet north, of equal size and richness to the main lode, and a tunnel in some 20 feet; capacity of mill, 15 tons per day; wood and labor both cheap, and a good supply of water. Six miles south is the Old mine, owned also by Dr. Handy, Bartlett & Co., a rich silver lode. And ten miles southeast of the Old mine, in the same mountain range, is the historic and noted Planches La Plata, a few miles across the line in Sonora.

Colorado.

SILVER PLUME CONCENTRATION COMPANY.—Colorado *Miner*, Oct. 21: These works are now running steadily, handling about 2- tons daily, and turning out a product of four to seven tons daily. The ore supply is good. and Superintendent Teal is well satisfied with the present status and future prospects.

MAGNET.—Geo. B. Thompson, who has lately returned from the Black hills, has leased this mine, and will set a force of 26 men at work next Monday. Large bodies of good ore are in sight, the workings are in first-rate shape, and development and extraction of ore will proceed rapidly.

BRIGHTON TUNNEL.—An important strike was lately made in this tunnel, showing a body of ore two to three feet wide, and as clean galena as we have seen in Colorado. Silver tests have not been made, but there is no doubt that it will pay largely. About 30 tons are now ready to send down, and the future daily output will be enormous.

COLORADO CENTRAL.—Mr. Weaver is working this famous mine to the best advantage, and extracting the usual amount of mineral. The ore is now running, first-class, 700 ounces, and second-class, 300 ounces, no other classes being made. At the present depth of 200 feet the need of a hoisting engine is severely felt, and when this is added, the production will be greatly increased. Rich streaks of brittle silver, showing crystals of baryta, are often met in the present workings.

PLANET MINING COMPANY.—This company intend to work a small force during the winter on the Gilman lode, developing their property. A fair amount of ore has been taken out from this vein during the past summer, and of good grade, and the lode holds good in length and depth.

GENEVA.—This active little camp is preparing vigorously for the winter's work. Jack trains are doing all they can, packing provisions and mining supplies, chiefly from Georgetown, to the different mines intended to be worked during the winter. The Revenue mining company intend to work a force of 10 or 12 men on their property, part driving the tunnel ahead, part drifting on the lodes already cut by the tunnel, and the balance sinking on the Celtic to make connection with their tunnel. By next season they will have a large amount of ground opened and will be able to produce a large quantity of ore.

ARAPAHOE COUNTY.—The ore reduction works of the Polar Star silver mining company, located in West Denver, and using the regular lixiviation process, are doing a good business, when the present state of the ore market is taken into account. The main supply of ore, some seven tons per day, comes from the Polar Star mine, Clear Creek county, and is supplemented by silver ores from other districts. Ores containing sulphurets of copper or iron pyrites are preferred. The process employed gives good satisfaction, and may safely be recommended as one of the most economical in use. From 500 to 600 ounces of silver, averaging some 900 fine, are daily produced at these works The number of men employed is 15, divided into 12-hour shifts.

New Incorporations.

The following companies have filed certificates of incorporation in the County Clerk's office at San Francisco:

NEVADA M. Co.—Oct. 26th. Location: Comstock lode. Capital stock, $5,000,000. Directors, F. P. Lauterwasser, A. P. Kluit, Robert Nohlett, T. Green and M. E. Sterling.

DIAMOND M. Co.—Oct. 26th. Location: Pacific coast. Capital stock, $10,000,000. Directors, V. D. Smith, Geo. Turner, B. F. Bivins, Thomas Parker and Wm L. Duncan.

GOLDEN GATE S. M. Co.—Oct. 28th: Location: Gold Hill, Nev. Capital stock, $10,000.000. Directors—James R. Lee, P. H. Humphrey, Peter Mulloy, A. H. Boyden and J. J. David.

GULF OF CALIFORNIA OYSTER AND CANNING CO.—Oct. 31st. Object: To carry on the oyster and canning business in the Gulf of California, to plant and transplant oysters in the bays of San Diego and San Francisco, etc. Directors—Pedro Garcia, Don Ramon Jose Gonzales, Wm. S. Manning, A. Blacklock and S. J. Purrsglove. Capital, $1,800,000.

THE great meritime canal, connecting Amsterdam with the German ocean, was completed on the 1st inst., with an imposing ceremony, at which the King, members of the Cabinet and foreign representatives were present. The canal is 160 miles long, and has at the sea end a harbor covering 250 acres, which, however, is not quite completed.

THE official report of the battle with Sitting Bull, Pretty Bear, Bull Eagle, Standing Bear and other Indians on Cedar creek, states that the number of Indians known to be killed is five. The report concludes: "I believe this matter can be closed now by vigorous work. Some cavalry is indispensable."

A Few Notes From Utah.

[From our own Correspondent.]

"Round the rugged rocks the ragged rascals ran."

This fine specimen of alliteration may answer well enough for a text. The reader will not for a moment imagine that it could have any allusion to the "honest miner" (of course not,) in hot baste to jump some equally honest miner's claim. The rocks throughout Nevada, through which your correspondent has just passed, and generally within sight of the line of the Central Pacific, in the Territory of Utah, are rugged enough, in all consciences, but the rascals, if such are to be found, are certainly not more numerous nor more ragged in these sections than elsewhere. An application might be made of it to the somewhat tattered condition in which some of man's inner habiliments are occasionally found, and in this sense may be used as a theme under which some evils of a general character may be conveniently grouped, confined to no particular district, class, condition or race. The employee in the mine has been known to shirk many an hour's labor to the great detriment of the assessment-paying stockholder. The superintendent is sometimes accused of gross ignorance, or grosser negligence, or of almost unpardonable extravagance in his expenditures, if not laying himself open to charges of a much graver nature. The capitalist, taking advantage of the power his money possesses, frequently monopolizes the business of a whole district, and is sometimes charged with compulsory acts towards his employees, or others directly or indirectly dependent upon himself for business, which often amounts to the worst kind of extortion, to call it by a no more approbrious name. The mining shark, (as your correspondent has in a few rare instances found to his sorrow), is not always scrupulous as to statements for publication if he thinks his immediate interests will thereby be subserved, nor is he likely to be particularly conscientious in driving a bargain with a stranger to the district, more especially if a foreigner, on the principle, it is presumed, of the old Spartans, who thought it no wrong to steal from an enemy. Evils such as these are not unfrequently met with throughout the mining regions of the coast, and are not likely to be remedied, it is feared, until mankind learns that the true interests of the individual are inseparable from the interests of the whole; that right doing in a broad sense is the best policy. Many, however, will continue, regardless of the disastrous effects to the community, to take the desperate chances of winning on the exception to the rule.

While on My way from Nevada

To visit and report upon some of the mines of Montana Territory, leisure was afforded for reflecting upon these and some other evils incident to human nature as at present constituted, and to mining communities in particular, and it seemed as suitable an occasion as any for calling the attention of those most interested to them, in hopes that a remedy for a few of them might be suggested.

The First Mines Encountered

After crossing the eastern boundary of Nevada, were at Terrace station. A large mineral belt had been discovered only a few miles to the north, some 15 miles in length and five in width, on which at least 150 locations had been made. Like some of the districts of Eastern Nevada, the country rock is granite and limestone, the ores consisting principally of black sulphurets of silver, carbonates, chloridea, argentiferous galena and oxides of iron, said to be rich in both gold and silver. Assays were reported from $25 to as many hundreds—some as high as $6,000 to $7,000 per ton. A large proportion will probably require the smelting furnace, while some of it can be easily reduced by the stamps. The veins vary in size from 6 inches to as many feet, and have been opened from 50 to 250 feet in depth. Some of the ore had been shipped to Salt Lake and to Winnemucca for reduction, giving in both instances satisfactory results. Something was being done in the way of sacking for shipment, and 2,000 tons or more were on the dumps, believed to pay well for working, if the necessary mills and smelting works were on the ground. Wood and water were represented as abundant.

While at Corinne

I learned from Mr. H. House, who has charge of that end of the road, that about four miles of Portland, Dalles and Salt Lake railroad had already been graded, and that the work was being pushed forward with energy, with the intention of completing it to Malade, Oneida county, Idaho, a distance of 50 miles, the ensuing winter. Another road is also said to be in contemplation from Corinne to the mammoth coal mines recently discovered in the western part of Wyoming. They are distant from this point about 100 miles, and the coal vein is represented to be 1,000 feet thick, with only a few thin strata of rock between, and to cover an area of not less then 30 miles square, the coal making a splendid coke.

Franklin, in Idaho, but near the boundary line of Utah, is connected with Ogden by a narrow gauge railroad 60 miles long and by stage line with Montana. A. O. K.

Mechanical Ore Concentration and Separation.—No. 10.

[Written for the PRESS by FRANCIS M. F. CAZIN, M. E. Santa Fe, New Mexico.]

This part of the subject should properly immediately follow article 5 of the series, since it treats of the application of the principles of specific gravity by mechanical contrivances, as the description of jigs will prove.

The more perfect these principles given are executed, the closer the action is kept to them, the more efficacious the separation will be. Thus separation may be obtained in some degree in working on material of unequal size; but in working on particles of equal size, only by the jigging mechanism the separation will be more perfect. While in the one case loss is probable and unavoidable, the working on equal sizes only offers the best guarantee against loss and will prove the most successful.

Any mineral dresser advising against the most minute assorting according to size, therefore, only proves by such advice his ignorance and incompetence and makes him a very dangerous individual, conspiring by ignorance or malice against the interest of the adventurer. All principles (physical) before stated with regard to liquids and mineral particles may be applied to air (blast wind) and mineral particles. Practice until now has evidently proven the separating action to be more effective and thorough in water than in air. But the art of mineral dressing will probably be extended both ways, and as well by the introduction also of heavier liquids than water as medium for the separating action, as by the more ample application of air as separating medium.

The variety of ores as well as of local circumstances is so large that only prejudice can declare one or the other method (wet or dry) as predominantly adaptable in all cases. Either method may prove the better one in cases where the nature of the ore and local circumstances come in in its favor. As the profession stands to-day, wet separation is the one of the two in which the largest experience is collected, in which the best and most improvements have been introduced and which is considered acceptable and advisable in all cases where water can be procured, even in such small supply as to necessitate its use over and over again, only replacing the loss of natural evaporation.

Vertical and Horizontal Streams.

Accessory to the separation through exposure of particles to a vertical stream of liquid or air, is the exposure to a horizontal stream, either simultaneously or independently. It only is important to know that, of particles of the same size, those of less specific gravity will be carried by the same stream to a greater distance than those of great specific gravity. Therefrom results, that in order to utilize a horizontal stream for separation according to quality, assorting according to size is as unavoidable as it is in utilizing the vertical stream.

The action of a horizontal stream is resorted to as an accessory contrivance in the continuous and automatic jigs for the purpose of continually moving the lighter particles away from the heavier ones, thus preparing space for the new supply and distancing all waste particles from the dressed material.

The horizontal stream is also utilized in special contrivances for treating very fine sizes, as will be hereafter explained.

These two modes of operation, as before specified, consisted in exposing ore particles free in and to the action of a vertical or horizontal stream of water or blast, thus receiving their motion or local arrangement amongst themselves solely by the contact with the water or air.

These two modes of operation are not the only ones successfully applied for mineral dressing purposes.

The Other or Third Mode

Is to spread the ore particles on solid planes (solid faces), either with or without motion, and to let flowing water or air out on the particles of ore. In this mode of operation, two different influence are exercised on the ore particles at the same time, viz: the influence of adhesion to the solid face on which the ore particles rest, and the influence of adhesion to the stream of water or air moving over or along the ore particles.

The difference of adhesion to a solid face and the difference of adhesion to flowing water amongst the particles constituting ore, are also a medium of separation and concentration.

This medium is applied in special apparatus called puddles, shaking or concussion tables, sweeping tables, etc. These apparatus will be described at the proper place.

Working of this Class of Apparatus.

With regard to these apparatus and to the principles therein applied, experience has established the following:

1. A horizontal (or inclined) stream of water (or air) carries ore particles of the same size on a solid face to a greater distance when they roll (globular shape) then when they slide (crystalline shape).

2. A horizontal or inclined stream of water (or air) carries ore particles of the same size on a solid face to a greater distance when they are of comparatively less specific gravity.

3. The difference in speed as above stated is not attained between ore particles unless they are of the same size.

No matter which of the three modes of operation may be applied, the assorting according to size cannot be dispensed with. The neglect of sizing before separating will always be the cause of failure and unsuccessful work.

With appropriate sieve arrangements the continuous jig may be employed as spontaneously sizing and separating, as hereafter explained.

PATENTS & INVENTIONS.

A Weekly List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

FOR WEEK ENDING OCTOBER 24TH, 1876.

LATHS.—Ezra Coleman, Virginia City, Nev.

TAPPETS FOR STAMP RODS.—James Brodie, S. F.

BOLT CULTIVATORS.—William C. Carleton, Boise City, Idaho Ter.

CORK EXTRACTORS.—John S. Saunders, Princeton, Cal.

WATER CLOSETS.—William Smith, S. F.

*The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of mention:

MACHINE FOR OPERATING EARTH AUGERS.—E. M. Hoagland, Watsonville, Santa Cruz county. This invention is an improved machine for handling and operating earth-boring augers for wells and other holes in the ground. The inventor provides a very convenient and simple machine for operating boring augers, as it permits him to finish a cutting of a certain depth and without stopping the operation to raise the earth to the surface, the whole being performed automatically. It would be difficult to describe the apparatus in detail intelligently without the aid of engravings.

CORK PULLER.—John S. Sanders, Princeton, Colusa county. This invention consists in permanently attaching to a cork or bottle stopper a bale or handle which can be used for drawing it from the mouth of the bottle or other vessel which it is used to close. The invention consists in passing a ribbon or other inelastic strip of webbing or textile material through the cork, near its lower or smaller end, so that a sufficient length of ribbon will extend out upon each side of the cork or stopper to project outside of the bottle when the cork is pressed in. These projecting ends can then be united together, so as to form a bale or handle, which can be used for drawing the cork. To prepare the cork for use, the inventor takes a flat, sharp needle, with a wide eye near its point, and inserts one end of the strip into the eye. He then forces the needle through the cork at a point near its lower end, so as to carry the ribbon through it far enough to allow its two ends to be tied together above the cork, and form a handle as described. This kind of an arrangement for pulling corks has been used before, but the ribbon passed under the bottom of the cork, and was liable to taint the liquid or would become rotten in time, so as not to be strong enough to pull the cork. With this improvement the cloth or strip is protected, so that it does not come in contact with the liquid, and these objections are avoided.

BULLION SHIPMENTS.—Since last report bullion shipments have been made from prominent mines as follows: Con. Virginia, October 25th, $91,111.57; Arizona, 25th, $950 63; Washington, (Cal.) 25th, 314¼ ozs.; Modoc, 25th, 420 bars—1,020 bars. Northern Belle, 24th, $12,006.91; Comanche, 24th, $7,689.08; California, 26th, $36 738 16—total no to date, $671,657.97; Con. Virginia, 26th. $40.179.60—total to date, $609,827.78; Ophir, 26th, $12,-262.91—total to date $168,235.18; Arizona, 25th, $950.63; Crescent, 27th, $2,590; Indian Queen, 24th, $3,057; Ophir, 30th, $24,166—total to date, $192,401; Northern Belle, 30th, $99,893.40—total to date, $771,551; Leopard, 30th, $7,200; Ophir, October 30th, $24.166.13—total to date, $192,401.49; Leopard, 30th, $7,-200; Indian Queen, 24th, $3,057.60; Tyho Con., 24th, $8,665.40; Con. Virginia, 30th, $50,585.-58—total to date, $897,565.40; California, 30th, $99,893.40—total to date, $771,531.37; Northern Belle, Oct. 29th, $16,005.25; Modoc, Oct. 29th, 300 bars—total to date, 1,520 bars; value $32,-000; Ophir, Oct. 31st, $10,818 09—total to date, $203,219.58; Justice, Oct. 31st, $35,090.

MONTANA.—Mr. A. C. KNOX, a valued correspondent, who has been connected with this office over 10 years, contemplates visiting briefly this Territory on business for the PRESS. Any assistance rendered him by the friends of this paper and the Territory will be worthily bestowed.

Gems and Precious Stones.

The Mining and Scientific Press.

It seeme ecarcely necessary to oall the attention of onr reedere to the varied contents of tha PRESS each week, for we are sure our efforts to make a good paper are appreciated. It would he well, however, for onr own constant readers to suggeet to others engaged in inquetrial pursuits the necesaity of subscribing for the PRESS. We aim to collate from all eonrces information of snch a character as will be of interest or valne to onr special class of readers. The miner or mechanic who desires to keep np with the times in his business muet snbecribe for some industrial journal and read it carefnlly; and it is better of course for those on this coaet to take e paper which ie published for their direct benefit here, than one of like character printed elsewhere. From long experience in this peculier field, the publishers and editors are familiar with the wante of the industrial classes of the Pacific coast, and are able to represent them faithfully.

A glance at the contents of any number of the PRESS will ehow how varied and needful ere its contents to miner, mechanic, or any one engaged in industrial or ecientifio pursuits. In mining metters particularly this journal pays particnlar attention. We give not only a description of all new methods or processes, but present all items of interest available on the snbject. The carefully compiled Mining Summary, containing, each week, all the late news in mining matters from all parts of the coast, is alone worth the subscription price, as it gives at a glance the status of the mining interest for the period under review. We take every opportunity to collect every kind of information of value to our mining readers, and the hinte and suggestions continually being published are of immense value to that class. Superintendents, managers and mine owners as well as miners read the paper each week, and we have among them many correspondents whose practical knowledge is of great value to others. The PRESS is continually on the lookout for matters of value to present its readers, and those who know the merite of the paper should bring it to the attention of others who would be benefited by becoming enhecribers.

The Weather.

We are fairly in for another season. The early rains have been copious beyond the measure of other years. The testimony of the raingange at several different points puts a measure upon the weeping of the skies as follows: San Francisco, for the season thus far, 3.76 inches; Sacramento, 3 01 inches; Santa Rosa, 6.5 inches to Oct. 27th; Napa, 8 42 inchee to Oct. 28th. In the southern counties there was also a visitation of rain which will doubtless open the season, but the measurements are not yet at hand.

It is quite an important matter to know the probabilities of the coming season as foretold by these early and heavy October rains. We have heard the opinion expressed at least a score of times, that early rains would be followed by a deficient rain-fall, and yet the examination of the S. F. rain tables indicates that the opposite is true. In 1849-50 the October downpour was 3 inches, and the season'e total, 33 inches; 1858-9, October, 2¾ inches, season, 22 inches; 1874-5, October, 2¾ inches, season, 18 inches. Of course there is no fixed rule by which such a salutary sequence can be determined, but there seems no reason to anticipate a lack where in former years, under similar conditions, there has been plenty.

It may be fairly expected that the year which begins with last week's rains will be one of activity and be memorable in our mining annals as a time of enthusiastic and encceaful effort for advancement and progress.

General News Items.

COMPANY A, Forty-eighth New York regiment, won the Nevada badge at Creedmoor on Monday.

TRADE dollars are selling in Virginia City at 92¼, notwithstanding the advance in the price of silver.

HON. CHARLES DELONG, ex-minister to Japan and well known on this coast, died at Virginia City last week.

THE Pacific Mail steamship *City of Tokio* hee come off the dry-dock with a sound hull, and otherwise in fine condition.

THE car, machine and carpenter shops of the Delaware, Lackawenna and Western railroad company at Great Bend, Penn., were burned Saturday night.

CHARLES M. HENDLEY, secretary of the Sioux commission, telegraphs from Yankton that the Sioux commission has accomplished its mission, and will adjourn at that place to meet in Washington, December 9th.

THE Pope having decired to divide the Archbishoprio of Lyons into two dioceses without the consent of the French government, the latter has issued a decree forbidding such division.

A DISPATCH from Rome says Cardinal Antonelli is dying. The Pope on Sunday ordered a consultation of physicians, who declared the Cardinal's case hopelese. Relatives were summoned to his bedside and found him unconscious.

LATEST news from the armies on the Morava is that the Turks have penetrated the Servian lines and cut General Tchernayeff's army in twain. Confirmation of this newe will be accepted as the signal for the advance of the Turks down the Moreva valley upon Belgrade.

A FRIGHTFUL accident occurred at the Royal Chinese theater on Jackson street, in this city, on Monday night. A cry of fire csused e panic, and in the efforts to leave the building 19 Chinamen were killed and a nnmber more injured. Some of those killed were euffocated and others trampled to death.

ANOTHEB assessment of $10 per share, amounting to $500,000, hae been levied on the stock of the Bank of California. In 10½ months eight essessments have been levied, aggregating $4,000,000, and it is expected that on January 1st the actuel paid up capital of the bank will he again $5,000,000 in gold coin.

THE Health Officer reports that the smallpox epidemic in this city is dying out. The diseaee now eitsoks only those who are brought into direct contact with it, and the circle of contagion is becoming daily smaller and emaller. The total nnmber of cases reported up to the present has been 1,010, and the total nnmber of deathe 284.

ALL the mills on the Cerson, with the exception of the Vivian, are rnnning. The Vivian will start up again some time in November.

WOODWARD'S GARDENS embraces an Aquarium, Museum, Art Gallery, Conservatories, Tropical Houses, Menagerie, Seal Ponds and Skating Rink.

SULPHUR is one of the oldest and best established remedies for skin diseases known to the profession. No suitable vehicle had been found by which to apply it to skin diseases on the face until GLENN'S SULPHUR SOAP furnished that *desideratum*. Sold everywhere.

Gold, Legal Tenders, Exchange, Etc.

[Corrected Weekly by SUTRO & CO.]

Scientific and Practical Books on Mining, Metallurgy, Etc.

Published or issued, wholesale and retail, by DEWEY & CO., MINING AND SCIENTIFIC PRESS Office, S. F.

BY GUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST.

Roasting of Gold and Silver Ores, and the Extraction of their Respective Metals without Quicksilver. 1870.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in the country and in Europe, and explains the why and wherefore.

It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus.

It is a work of great merit, by an author whose putation is unsurpassed in his specialty.

Price $2.50 coin, or $3 currency, postage free.

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arsenicurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequaled by any other published, embracing the subjects treated. Its authority is highly eteemed and regarded by the readers; containing, as it oes, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot be found eleewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diegrams, illustrating machinery, etc., which alone are of the greatest value. PRICE REDUCED TO $5.

The Explorers', Miners' and Metallurgists' Companion.

Comprising a Practical Exposition of the Variouе Departmente of Exploration, Mining, Engineering, Assaying, and Metallurgy,

Containing 672 Pages and 83 Engravings

BY J. S. PHILLIPS, M. E.,

Of California, a Practical Operator for Thirty-four Years: Explorer, and Resident in the Pacific States and Territories for the past Eight Years.

PRICE, bound in cloth, $10.50; in leather, $12. Forwarded by mail for 50c. extra, at the MINING AND SCIENTIFIC PRESS Office, hy

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

J. L. THARP—San Francisco.

B. W. CROWELL—California.

O. W. MCGREW— Santa Clara county.

A. C. KNOX—Nevada and Montana Territory.

C. N. WEER—Santa Cruz and Monterey counties.

A. G. CHAMPION— Tulare, Fresno and Kern counties.

RICHARD RUDE—Nevada.

B. GOODWIN—California, Oregon, Washington and Idaho Territory.

A. U. STRONG—Lake and Napa counties.

WM. J. LAWHIE—Sonoma and Marin counties.

G. KUPNOW—San Joaquin county.

H. O. OLIVER—Contra Costa county.

W. D. WHITE—San Bernardino and Santa Barbara counties.

Thanks for Prompt Attention.

STOCKTON, June 26, 1875.

Messrs. Dewey & Co., S. F.:—

I have received the patent for my invention in wagon brakes, which you prosecuied for me; patented May 11, 1875—No. 163,046. Thanke to you for your prompt attention to the case; you will hereafter be my attorneys in such cases. I recommend all inventors on the Pacific coast to give you a call, which I think they will never have any cause to regret. Very truly yours,

GEO. G. BUCKLAND,
Stockton, Cal.

SUTTER CREEK, February 26th, 1875.

MESSRS. DEWEY & CO.—I have received my Letters Patent through your agency. And, for your prompt-nese, accept my thanke. Youre, S. N. KNIGHT.

Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the name.

Office Cascade Blue Gravel Mining Company—NOTICE:—

A meeting of the stockholders of the Cascade Blue Gravel Mining Company will be held at the office of the company, 311 California street, rooms 3 and 4, second floor, San Francisco, Cal., on Monday, November 20th, 1876, at two o'clock P. M., for the purpose of disposing of the company's stock, and authorizing the sale of the entire property of the company, with any other business that may come before said company. R. F. KNOX, President,

J. M. BUFFINGTON, Secretary.

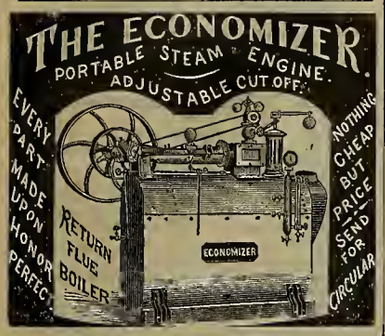
San Francisco, Oct. 13th, 1876.

Eagle Quicksilver Mining Co.—Location of works Santa Barbara county, Cal. Principal place of business, San Francisco, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 30th day of September, 1876, an assessment (No. 9) of two hundred and fifty ($250) dollars per share was levied upon all the minee of said company, payable immediately, in gold coin of the United States, to the Secretary, at his office, rooms 5 & 6, No. 302 Montgomery street, San Francisco, Cal.

Any shares upon which said assessment shall remain unpaid on Wednesday, the 29th day of November, 1876, shall be deemed delinquent, and will be duly advertised for sale, at public auction, and unless payment shall be made before, will be sold on Monday, the fourth day of December, 1876, as provided by the articles of agreement of said company, to pay the delinquent assessment, together with cost of advertising and expenses of sale. By order of Board of Trustees. WM. H. WATSON, Secretary.

Machinery.



—FOR—

Cotton Gins, Printers, Cheese Makers Laundries, Cabinet Makers, and All Manufacturing where Light Power is Required.

A. L. FISH & CO.,

Sole Agents for California,

For Chloridizing, Desulphurizing and Roasting Ores.

—ALSO—

STEAM ENGINES, SAWMILLS, SHAFTING, GEARING AND MINING MACHINERY.

☞ Send for our illustrated catalogue.

Buffalo Excelsior Pony Planer & Matcher

Patented Mar. 30th, 1875.

Best of its kind in use. Price, complete, $275. Also, small Pony Planers and Planing Machine Knives, which are recommended as superior and extra in quality. 100 Scroll work designs free on receipt of stamp. For circulars giving detailed information, address

GEO. PARR, Buffalo, N. Y.

THE O'HARRA

CHLORIDIZING FURNACE.

Guaranteed to Chloridize from 85 to 95 per cent. of any gold or silver ores that are not more profitable for smelting. Will also desulphurize ores and put them in proper shape for working in cupola furnaces.

Cost of Roasting and Chloridizing by this Process:

Two cords of wood at $6	$12.00
Two firemen at $4	8.00
1500 lbs of salt at 1½c	22.50
Wear of shoes and power	1.50
Cost for 15 tons	$44.00
Cost for one ton	2.93⅓

In a furnace of three or four times this capacity the cost is decreased by 20 per cent.

The furnace is now working successfully at the Poe Consolidated Co.'s mines, in the Peavine District. For further information, apply to

D. J. C'HARRA,

Reno, Nevada.

PICKERING ENGINE GOVERNOR.

Vallejo Foundry, October 17th, 1876.

MESSRS. NEYLAN & YOUNG, San Francisco.

Agents "Pickering Governors."

Gents:—The 10 two-inch Improved Speed Adjusting Governors I bought of you this year for my Patent Straw Burning Threshing Engines give splendid satisfaction. They far surpass for regularity of speed any Governor that I have ever seen, and I have seen all of the best kinds; I have seen the main belt fly off the pulley several times this season while threshing, and the engineer did not discover it, so perfectly was the speed maintained, until he was told of it; this I consider something wonderful; I consider the Governor absolutely perfect, so far as speed is concerned. I bought, and put on to one of my engines a Shive Governor, to see which was the best, and after one season's trial I have no hesitation in saying they are as far superior to the Shive, or any other Governor that I have seen or used, as the Shive Governor is to the old Butterfly Valve Governor. I wish you would send me the lowest price that you can furnish 25 Governors for next season's engines.

Yours, respectfully, I. L. HEALD.

LOOK

The Great Western Scroll Saw Co.'s New and Improved $5 00 Foot and Steam Power Scroll and Bracket Saw is the best one yet invented. With it men and boys are making from $3 to $10 per day. We will send you a Machine, six Saws, 15 Patterns and two feet of prepared wood on receipt of $5. Address,

GREAT WESTERN SCROLL SAW CO.,

Leavenworth, Kansas.

Diamond Drill Co.

The undersigned, owners of LESCHOT'S PATENT for DIAMOND-POINTED DRILLS, now brought to the highest state of perfection, are prepared to fill orders for the IMPROVED PROSPECTING and TUNNELING DRILLS, with or without power, at short notice, and at reduced prices. Abundant testimony furnished of the great economy and successful working of numerous machines in operation in the quartz and gravel mines on this coast. Circulars forwarded, and full information given upon application.

HAMMERED IRON

Of every description and size.

☞ Orders addressed to PACIFIC ROLLING MILL COMPANY, P. O. box 2023, San Francisco, Cal., will receive prompt attention

☞ The highest price paid for Scrap Iron.

PHELPS

Manufacturing Company,

MANUFACTURERS OF ALL KINDS OF

Wharf and Bridge Bolts, Railroad Trestle Work, Car Frames and Bolts, Machine Bolts, Set Screws and Tap Bolts, Lag or Coach Screws.

ALL STYLES OF FANCY HEAD BOLTS.

HOT AND COLD PRESSED HEXAGON AND SQUARE NUTS, WASHERS, BOLT ENDS, TURN-BUCKLES, ETC., ETC.

13, 15 & 17 Drumm St., near California,

SAN FRANCISCO, CAL.

OCCIDENTAL FOUNDRY,

137 and 139 First street, - San Francisco

STEIGER & KERR,

IRON FOUNDERS.

Quicksilver Condensers and Furnace Castings.

Sole manufacturers of the Hepburn Roller Pan and Callahan Grate Bars, suitable for Burning Screenings.

NOTICE.—Particular attention paid to making Superior Shoes and Dies.

UNION IRON WORKS,

Sacramento.

ROOT, NEILSON & CO.,

MANUFACTURERS OF

STEAM ENGINES, BOILERS,

CROSS' PATENT BOILER FEEDER AND SEDIMENT COLLECTOR

Dunbar's Patent Self-Adjusting Steam Piston

PACKING, for new and old Cylinders.

And all kinds of Mining Machinery

Front Street, between N and O streets.

SACRAMENTO CITY.

Brass Foundry & Pump Factory.

A. J. SMITH, Plumber,

Sole Proprietor and Manufacturer of the

Celebrated Hudson Force Pumps, Atwood & Bodwell Windmill Brass Pumps, Smith's Copper-Lined Pumps, Plumbers' Force Pumps.

☞ Special attention paid to Brewers', Distillers', Beer and Hot Liquor Pumps and Wine Pumps. Particular attention paid to AIR PUMPS, also to

DIVERS' SUBMARINE PUMPS.

Artesian Well Pumps Made to Order.

☞ Brass Castings Made to Order.

ENGINES AND BOILERS,

(SEMI-PORTABLE)

1, 2, 4, 6, 8, 10 and 12 H. P.

WRIGHT'S

Bucket-Plunger Steam Pump.

COSMOPOLITAN EMERY WHEELS AND STANDS.

Putnam Machine Company's

MACHINISTS' TOOLS and

Wood Working Machinery.

HEALDS & SISCO

Centrifugal Steam Pumps.

FARMER'S ELECTRIC MAOHINE FOR BLASTING AND HILL'S EXPLODERS.

HASKINS' BLOWING ENGINES

For Mines.

Large Assortment of

MORSE TWIST DRILLS.

HASKINS' PORTABLE HOISTING ENGINES, constructed especially for economical use in mining districts, with Compressed Air or Steam, adapted to all classes of underground work and made throughout on the interchangeable plan, so that all parts can be duplicated when desired. Catalogues and Estimates given on application.

AVERILL MIXED PAINT,

MANUFACTURED BY THE

CALIFORNIA PAINT COMPANY.

THIS PAINT IS MIXED READY FOR USE.

THE PUREST WHITE, AND OF ANY DESIRED SHADE OR COLOR.

It will not peel, crack nor chalk off, and will last twice as long as the best white lead, prepared in the ordinary way. Is cheaper, handsomer, more durable and elastic than the best of any other Paint.

For Sample Cards and Circulars, Address

CALIFORNIA PAINT COMPANY,

115 PINE STREET, SAN FRANCISCO.

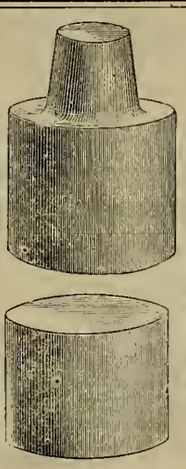
SUCCESSORS TO

THE LATE DAVID STODDARD.

Machinists' Tools and Pickering Governors.

BIGELOW PORTABLE ENGINE AND BOILER, FROM 4 TO 15 HORSE POWER. FOR SALE CHEAP.

STODDARD'S PATENT CONDENSER, for All Kinds of Steam Pumps



PATENTED

CAST STEEL SHOES AND DIES.

Guaranteed Cheaper than the Best Iron.

IMPORTANT NOTICE.

Reduction in Price from 16 Cents to 12 Cents Per Pound.

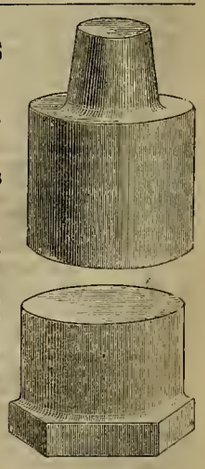
Owing to our largely increased business, the present low price of Iron from which our Steel is manufactured and the improved facilities for casting and forging, we take great pleasure in announcing that from and after this date we will supply our IMPROVED CAST AND FORGED STEEL SHOES AND DIES FOR QUARTZ MILLS at 12 cents per pound, delivered at San Francisco or Sacramento, instead of 16 cents, as heretofore.

We also furnish Steel Plates for Blake and other Ore Crushers, Steel Gut Gearing, etc., for Mills and Hoisting Works, Steel Pan Shoes, Battery Cams and Tappets, etc.

Address all orders, with dimensions or drawings, to

CAST STEEL SHOE & DIE CO.,

59 Nevada Block, S. F.



DEWEY & CO.

American & Foreign Patent Agents

OFFICE, 224 SANSOME STREET, S. F.

PATENTS obtained promptly; Caveats filed expeditiously; Patent reissues taken out; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secure, with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Baden, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemberg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Grenada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule prices for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We *can and do* get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country) sooner than any other agents.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more correctly judge of the value and patentability of inventions discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars free.

Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing them to the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applicants which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

Engravings.

We have superior artists in our own office, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

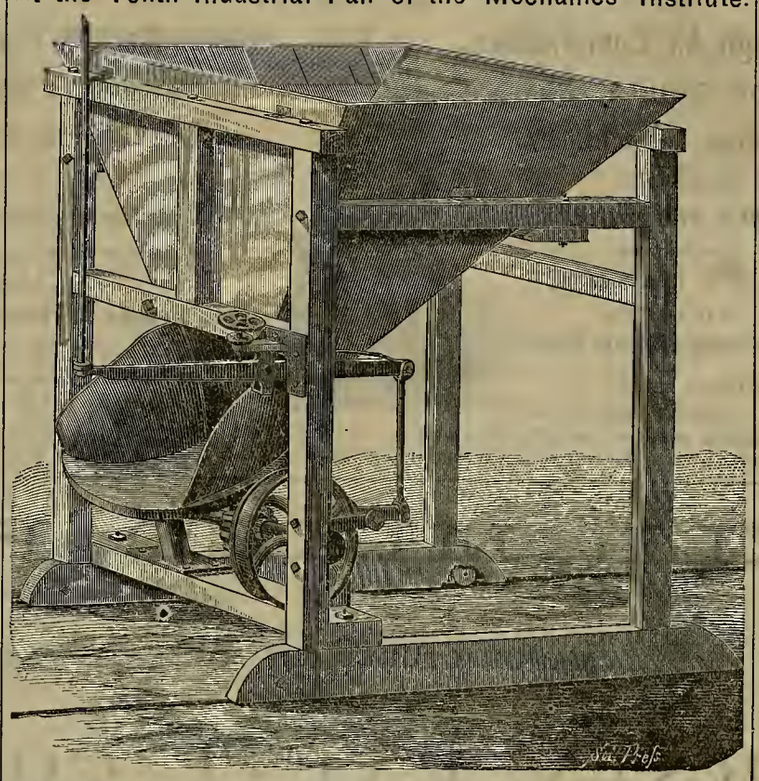
$1,000 Challenge Ore Feeder,

AWARDED FIRST PREMIUM

At the Tenth Industrial Fair of the Mechanics' Institute.



It may be considered as now fully demonstrated, by careful and long-continued experimentation, that the plan upon which a perfect ore feeder must be constructed is that of the *carrier*, and not that of the shaking table. Uniform and accurate feeding is not possible upon the latter plan. The ore must be evenly carried, upon a steadily advancing plane, or table, to the line of discharge, and there simply *dropped*. Spasmodic or jerky contrivances will not answer the purpose.

REFERENCES.

A letter received from the Julian Mill, Newcastle, says, of the Carrier Feeder: "It is the most perfect Feeder we have ever seen; don't see how any mill can do without them."——A letter from Mr. C. C. Belding, of Amador County, speaks in the highest terms of them.——Two of the machines were shipped to the Bunker Hill Mill, also Gover Mill, Amador County. ——Mr. Stevenson, of Boston Mill, Gold Hill, Nevada, says they are the best Feeder he has ever seen.——Soulsby Mill, Tuolumne County ——California Company, Nevada City. ——Omaha Gold Mining Company, Grass Valley.——St. Patrick Mill, Placer County.

$1,000 CHALLENGE.

Backward in Coming Forward.

O. P. STANFORD FAILS TO COME TO TIME ON THE CHALLENGE OF $1,000 TO TEST THE MERITS OF HIS ORE FEEDER AS AGAINST MINE. THE CHALLENGE IS STILL OPEN TO HIM OR ANY ONE ELSE. *GENTLEMEN, PUT UP OR SHUT UP.*

We warrant the machines to give perfect satisfaction, and to be a better and more durable Feeder than any other in the market, and will sell them as cheap as any other of its class.

PAUL'S DRY PROCESS.

I am now prepared to test gold and silver milling ores in any quantity from FIVE POUNDS to FIFTY TONS, and assert my ability to prove, by machinery NOW UP, and open to public inspection, and by practical testing of its merits, that I can increase the yield of gold mills, working wet batteries and copper plates, from FIFTY to ONE HUNDRED PER CENT., and on silver ores a much larger percentage than by pan amalgamation, and at less expense than any known method of working quartz well; and from some "gold" ores of California can extract more silver extra with the gold, which is now lost, than all the expenses of mining and milling. Having had 25 years' practical experience in milling gold and silver ores, I presume to know whereof I speak, and AM PREPARED TO PROVE ALL I ASSERT. These mills, for simplicity, cheapness practicability and perfection in working, challenge the skill of the age to surpass. Quartz miners who desire to investigate and have their ores tested, are invited to a critical examination of the machinery and process, and can receive permits for examination, particulars and pamphlets explaining process by calling at my office. The Victor Drill Chuck.

Wa illustrate herewitb a new self-centering drill chuck, in which the clutches are flosh with the face or frout of the device, hy which arrangement it ia claimed the workman has less difficulty in adjosting tha drills, and the said clutches are not liable to be broken under strain or through dropping tbe chuck. Tbe invention embodias a new device for operatiug the levers which control the clotches, and there are various other advantages wbich will be noted as we progress.

The ohuck head has a spindle wherehy it is secured to the latbe maudrel, and also a small screw which geara into the female screw formed inside the chuck holder. A spindle on tbe head carries a cylindrical follower, as shown in tha sectiousl view, Fig. 1, which is provided with three longitudinal slots having bottoms inclined as represented.

The rear ends of the levers which actuate tbe clntches enter the above mentioned slots, and at their fulcruma are enlarged and rounded, so that they there have spherical bearings which rest against adjustable set screws passing through the walls of tha holder. The clutches each consist of a short metal cylinder having a broad longitudinal feather and beveled at the lower edges. These fit in a series of radial cylindrical chambers near the face of tbe holder, the latter heing slotted iu front of the cylinder to receive tha feethers on the clntches, which come flush with the front of the chuck. The front ends of the levers fit into recesses of the clutches, the rear ends heing provided with pivots to return the clutches or throw them out when the rear ends of the levers are releaaed hy the follower. To effect this, the recesses in tbe follower are grooved on the sides on a line parallel witb the inclined bottom. Into these grooves the lever pivots enter, so that the levers are tbrown back on the return motion of the follower.

The device holds from 0 to ⅜ inch drills, or will carry ¾ by reducing the shank as shown in Fig. 3. The drill being inserted between the clutches, the chnck head is then turned eo as to advance the follower, when the inclined hottoms of the receeses force the rear ende of tha levers apart, pressing the clutches together in their radial chamber toward their common center, oancing them thue to grasp and hold the tool. Wben the latter is to he releaaed the operation is reversed. The pivots and the grooves in the follower then act upon the levers, bringing them back to tbeir original positions and moving the clutches away.

The exterior appearance of the chuck is shown in Fig. 2. Its construction, of steel throughont, is durable and strong, and ths arrangemeut of the levers, as already expleined, admits of its easy sdjustment. This chnck ie mannfactured by the Victor sewing macbine oompsny, Middletown, Conn.

Fig. I.

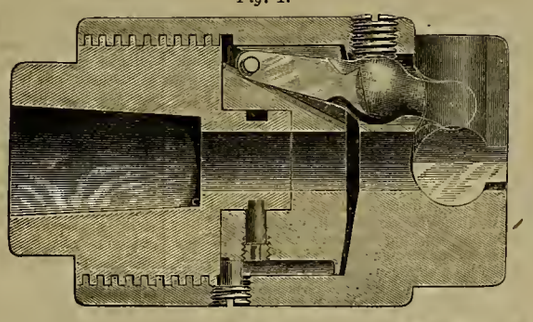

Fig. II.

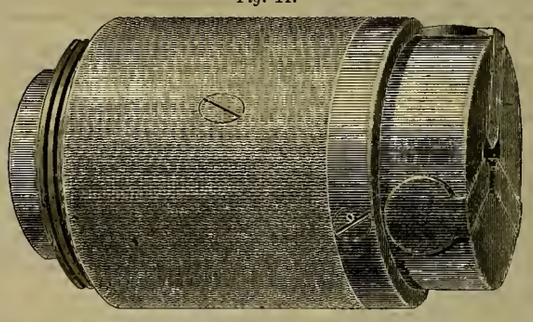


THE VICTOR DRILL CHUCK.

Practical Workmanship.

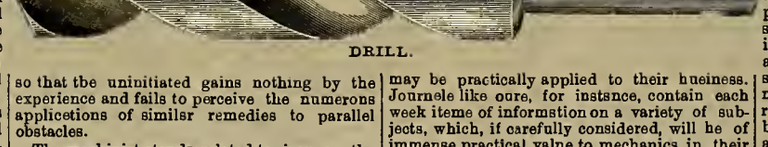
Practical workmanship is not a mere matter of accustoming the fingers to perform mechanical movements, bnt is governed by a series of distinct principles, simple and complex, the employment of which depends at all times upon the perceptiou and judgment of the artisan. Nearly tha whole distinction between an expert and an indifferent workman consists in tbeir reletive capahility to perceive the principles applicable to particular work, and in their readiness in overcoming the ionumerable little obstacles which present themselves, rendering a deviation, at times, from a common rule either highly advantageous or absolutely necessary.

Tbe inexperienced or unohservant mechauic freqoently fails to recognize the very principles be applies to his work, although conscious of a large class of conditione nnder which he could proceed by the same method; becsnse experience has forced it upon bim as indispensable in such cases. Being dependent npon the information which he may be eble to gather from the particular pieces of work which chauce to fall to his lot, and to such scraps of disjointed iustrnction as a fellow workman may feel disposed to impart, it often occars that, where he enconnters a difficulty, the more experienced hand who helps him out of it neglects to explein the principle governing the means by which the difficnlty was overcome, so that tbe uninitiated gains nothing by the experience and fails to perceive the numerons applicetions of similsr remedies to parallel obstacles.

The machiniet stands related to iron ae the carpenter, joiner, cabinet-maker, wheelwright, etc., do to wood, with the disadvantage that he has to design and determine the shapes and temper of hie tools, which vary so much (to snit the work) that the tools suitable for one piece may be totally inedeqnate to perform the same eervice npon another, althongb the proportions, the texture and the metals may be alike in hoth instancea. We cannot, therefore, tell a good machiniat by hia tools, unless we know for what particular piece of work those toola were used. Nor cen a machinist he judged by hia ahavinga, hecauee there are many kinds of work for which a tool keen enougb to cut a tbick and clean shaving cannot be nsed to advantage. Even the speeda, given in mechanical hooks, at which to cut metals, tend to mislead, hecanse the natnre and size of the work, the depth and nature of the cut, and numerous other infinences render the variation of the cutting speed at times one-third greater or lese than the given apeed. A knowledge, however, of the general rules, together with an intelligent nnderatanding of the principles governing the exceptions and deviations, will enable the artisan, wheu a difficnlty arises, to at once perceive its precise csuse and to apply an adequate remedy, conditions requiring to he understood to render tbe application of the principles governing them palpahly necessary aod eesy of accomplishment; thus rendering the learning of the trade more a matter of understanding and less a matter of unintelligent lahor.

These ideas, which we take from tbe preface of Josbua Rose's "Complete Practicsl Machinist" (for sale hy Bencroft & Co.,) shonld he carefully nnderstood hy all workers in iron. The education of the shop is, of course, entirely practical in its nature and absolutely universal in the scquisition of skill and experience. The mechanic ahould not, however, on this scconnt entirely neglect to acqnaint himself with what he may learn from hooks. As a general thing books on mechsnical subjects are written by persons of sufficient practical as well as theoretical knowledge, to understand thoroughly the subjects of which they treat. There are few workmen who cannot learn something of others oi the same trade; end the experience of many is, from the nature of the thing, more varied than that of a single person. Mechsnics, therefore, ebould he readers as well es workere if they would educate themselves up to a higb standard. Books, magszines and newspapere devoted to the intereste of mecbanicsl pursnits sre now plenty and cheap, and there is no excuse for mechanics not owning a few books, end subscribing for at leest one periodical. They are sure to receive hints of value which may be practically applied to their hueiness. Journels like oure, for instance, contain each week iteme of information on a variety of subjects, which, if carefully considered, will he of immense practical valne to mechanics in their trades. Every mechanic should not only read, hut contribute bis share of information; for by the imparting of knowledge nothing is lost to the giver, while much ie gained hy the receiver. Thie principle wes recognized even hy the ancients as one of the moral obligations of mankind, and old Cicero impressed it upon his son in his admirable letters, *De Officiis*. It is none the less binding now, althongh principally carried out by those who write hooks for the heuefit of mechanics, and not by the mechanics themselves, who are too apt to keep their knowledge to themselves.

Fig. III.



DRILL.

The Heating Power of Straw.

Now that straw has become a promiuent fuel in our steem threshing, it is interesting to note its heating power as compared with wood and coal. From some experiments made at tha Vienna exposition, a report of which has just been published, it seems that straw gives in effective heating power a nesrer approach to its theoretical heating power than either wood or coal. Thns, while the theoretical heatiog power of coal is 11.51, the actoal heating power obtained from it in a steam boiler is 5.2 to 8. Of wood the theoretical power is 4.3 to 5.6; effective power, 2.5 to 3 75. Of straw, the theoretical power is 3, and the actual, 1.86 to 1.92. From these figures it appears that straw raises more steam in proportion to its theoretical heating value than either wood or coal. Tha difference between the theoretical heating power of a fuel and the effective heating power is the amonnt which is lost by imperfect combustion, radiation and other causes, and this loss hae been fonud hy experiment to be ahout 53 per cent., or more than one-half. Trials at tbe Vienna exposition proved that one ponnd of straw is capable of evaporating from 1.81 ponnds to 1.97 pounds of water into steam of 70 pounds pressure and 305.6 degrees Fah.

Tbese results obtained at Vienna wonld probably be found true in greater degree in this State, because our etraw is hetter aud drier and conseqneutly uses less heat to evaporate its moisture, and hecause our coal is poorer. Thue the ratio hetween straw aod coal would be more in favor of the straw.

It would he an interesting matter to know whst is the practicsl heating power of straw as shown in work accomplished. Tbat is, for instance, how many pounds of strew was used in threshing a ton of grein. Straw is of such little value in this State that the qnestion is not highly important as an economical one, hut it would be e satiefaction to know tbis and it might eerve as a basis in useful calculstions. If any of our readers have deta from which the fact can he ehown, we ehould be pleased to hear from them.

Miners' Strike.—Tbe miners employed in Hsnk Mitchell'a coal miue at Pancake monntain struck for $4.50 per day, lset week, declining to work longer for $4 per day—the rate at which they were heing paid. Mr. Mitchell refused to accede to the terms of tbe men and they quit work. As $4 per day ia the going rate of wages for minera in this section, Mr. Mitchell does not anticipate any difficulty in procnring a new force of men.—*Eureka Sentinel.*

We were yesterday, aays the Virginia *Enterprise*, shown some apecimens of ore fonnd on tbe anrface of the ground in Castle district, four or five miles north of this city, which ahow well in free gold. Specimens of rock full of free gold were found in that district as early as 1861, bnt aa yet no one has been able to find the lead from which they came.

There is some talk in Pioche in reference to removing the American Flag mill over to Toquerville, Utah. Late developments in Leeda diatrict are of sucb a rich and permanent nature that it ia believed a good mill wonld pay well.

The new furnace at Highland, Nev., is completed. There ia a large quantity of ore on the dump, and the proprietors expect to make a good run.

Our Water Power.—The Truckee *Republican* says: "Combine all the streams in New England into one, and they do not present a water-power equal to the Truckee river. Imagine a stream of pure mountein weter with an increasiog flow of 18,000 cubic feet per minute, through a narrow valley for a distance of 50 miles; a stream which never freezes, never overflows its natural banks aud is so confined by natural barriers that it can never endanger bridges, dams, buildings or property of any kind. Have such a stream running for fifty milss alongeide of a continental railroad, and hetween two States, and then inform ns if it does not possess important manufactnring advantages.

Hon. H. K. Mitchell returned from a visit to Ward district last Sundey, saye the *Sentinel*, and left the following day for San Francisco. Mr. Mitchell predicts that there will he hard times and much suffering in Ward during the coming winter, owing to the curtailment of mining operations which the weather will necessitate, which will throw out of employment a large number of miners, peckers, wood-choppers and coal-hurners. He, however, expresses a high opinion of the value of tbe mines of Ward district and thinks it will he a lively camp next summer.

A new ore-house is heing framed for the Con. Virginia and California mines. The work is heing done east of the depot and the honse is to he built on the new side-track, under the tramway running east from the C. & C. ahaft and hetween that and the California battery mill.

CORRESPONDENCE.

Mines Around Virginia City, Montana.

[From Our Own Correspondent.]

EDITORE PRESE:—A comparatively pleasant ride by stage from Franklin, Idaho, (for the rain had laid the dust,) brought us to Virginia City—a dietance of about 300 milee. The mining in this vicinity hae hitherto been ohiefly placer, although recently quite an intereet has been awakened in regard to qnartz.

Placer Mines.

Alder Creek gulch, extending eeven or eight milee below the city and ae many milee above, was at one time exceedingly rich, supporting a population of near 10,000, and turning out immenee sums annually in gold. Some eay thet it has yielded during tbe past 10 years from $50,000,000 to $60,000,000. Tbe minere are etill doing remarkably well, eepecially in view of the fact that the ground has heen worked over once at leaet in most places, and in some inetances oftener.

The Montana Flume Company,

Seven milee below Virginia City, hold a United States patent for 160 aores, and work hy a three-foot flume. At preeent leased to Chinamen on the sharee, and yielding the company over $3,000 per annum, eaying nothing of the amount etolen.

Mesere. Sedman & McGregory have a olaim higher np of 160 acres also, one and a half milee in length and widening in places to a quarter of a mile. Tbis ground is said to have originally been ae rich as any in tbe district, perbaps more extensive than any other claim. It has been worked for 12 years, and will probably continue to pour forth its rich treasnree for 100 yeare to come. Tbe past few years hae produced eech eeaeon from $10,000 to $25,000. It is worked by a 30-inoh flume, carrying from 200 to 300 inches of water on a grade from one and one-eigbth to one' and one-balf inchee to the 12 feet. About 60,000 feet of bedrock were cleared up with the aid of eight men in seven months, tbe gravel being about 15 feet in depth.

Incluaed in the eame patent as above there is a claim of 11¼ acree, owned by Messrs. Finley & Moulton, tbat is paying about one ounce to tbe man per day, or about $150 in the aggregate. Mr. E. F. Bond'e claim of 35 acree ie doing well et preeent. The higbest average given, probahly some time ago, wae $800 per day for four men, one small pit heing pointed ont from which $5,000 bad been taken. It averegee from $8,000 to $10,000 per year.

Davis & Co.'s claim, adjoining the above, was reported as yielding from $10,000 to $20,000 per seaeon. Mr. T. A. Fenner has 2,200 feet of gulch and bar mines in the same vicinity, character of gravel similar to the claime above desoribed and at present paying well. It ie

Worked by Machinery

Claimed as hie own invention and construction, and may very properly receive a little notice in detail. The car is drawn up hy one of Hallidie'e steel hardened iron roues hy water power. When the car comee over the dump hox, the hooke which hold tbe hottom of the car in place are thrown ont hy coming in coutact with a ratchet, thus letting the trap down and causing the dirt to drop into tbe dnmp hox The car then rune on to a roller which oloses the trap on the hooks. Tbe depth to bedrock in thie claim is about 16 feet. There ie a pit opened about 100 feet square and a hox-drain laid from the lower to the upper end of the pit. A bead of water, the eame, hy the way, which runs the machinery, ie now turned on, which washee off about one-half of another hundred feet ahead; when the maobine is moved up and the remaining gravel cleaned up, in readiness for the repetition of a similar operation. Tbe proprietor considere this mode of working equal to, if not euperior to a bedrock flume, particnlarly in a ligbt grade gulch. Mr. McGinnis, a sbort dietance above, witb the aid of one man ie taking out about $130 per week.

The olaim of Meesre. Hanser, Lee & McCauley, just below the city, ie represented as paying good subetantial wagee, though no figures were given. This is but a very meager sketch of what is doing in the lower end of the gulch, and brings us to Virginia City, once the capitol of the Territory, and hoasting a popnlation of several thousaud. It now numbers probably from 700 to 800; is tbe center of a rich mining and agricultural district; hae at least a dozen large business housee, two hanks, a very substantial courtbouse, a fine public school building, several churches, and tbree or four hotele—the Crescent, run by Mr. T. Stees, our very accommodating host, being numbered among the best.

The first mine above the city, in

Alder Creek Gulch,

Is the drifting claim of A. M. Hart & Co., running winter and eummer with excellent resulte. Mesere. Hayes, Sterne & Co. are next in order, employing four men, and teking out on an average per diem from $70 to $80. Parker, Williame & Co., a mile or so above, usually employ from seven to twelve men, tbe mine said to pay from $8 to $12 per day to the man. Tne gross yield the preeent season will probably not fall much short of $15,000. The Highland fluming oompauy, etill higher up, expect to reach eomething upward of 1,000 ouncee for the year's work, the gold running about $17.65 fine. Tbie claim has a linear extent of 6,000 feet, and ie considered one of the most valuable on the creek, giving employment to from 16 to 20 men. I wae informed hy Mr. E. G. Herendeen, the euperintendent, that the company held a water right which greatly enhanced the value of the property, tbe water being brought from lakes in tbe mountains, and giving tbem, by meane of reservoire, a eupply of 200 additional inches for about 70 deye.

The Pine Grove, the next above, Mr. J. McRoberts, president, has 4,300 feet in length. A larger amount of ground has been worked than usual, and thought to bave paid better; the total for season in the neighborhood of $10,000.

The Southmayd and also the Summit fluming company will probahly each yield fully as much as the laet mentioned, which is certainly not a bad showing for these eo-called "hard times."

There are other claims, extending sbove Summit City, which is distant from Virginia about eight miles, hesides a very considerable amount of gravel mining in Brown's gulch, and on otber streame not many milee from Virginia, the details of wbich are not necessary.

Sufficient has certainly heen given to ehow that the placer mines are by no means playen out.

Some Quartz Mines.

Beginniug at Summit City, where our description of the placer mines closed, a few of tbe quartz olaims may now be taken up and briefly noticed.

The Keystone,

The property of Mr. E. B. Covely, of this place, has heen opened by tunnel 225 feet, striking lode at a depth of 150 feet. The greatest depth reached by sbaft, 170 feet. The ledge averages six feet from wall to wall, which are well defined, with from 18 to 20 inches of gold and eilver bearing quartz, milling $35 in gold, and so far not worked for the silver, although giving aesays as high as $70 per ton. The mine has been worked at intervals for the psst 12 yeare, and bas yielded the present owner alone about $35,000.

Tbe Kearsarge, in this neighborhood, at preeent idle for want of proper machinory to drain the mine, has a sbaft 180 feet deep, and ie reported as having psid thus far upwards of $80,000. The Oro Cacbe, eitnated also at Summit City, and at present worked by Mr. Chas. De Wolf, ie thought to be the richest mine in this vicinity, the ore running ae high as $225 in gold, and the gross yield having heen considerably greater tban any other. There are a number of other locations here on lodee from eight to ten feet wide, mostly low grade—$8 to $12 per ton—which will be worked when the water, now monopolized hy the placer mines, is uo longer needed.

The Easton Lode,

Owned by Emery Brothers, is situated in Brown'e Gnlch district, four milee in a eouthserly direction from Virginia City. It is a beautiful little vein, averagiug, perhaps, a foot in width, and consists of a good milling, silver bearing qnartz that works $100 per ton, the cost of milling with present facilities being about $50 per ton, still leaving, with all the drawhecks, a nice little margin for profite. Nothing is being done on any other claims in the neighborbood, although another was heard of tbat worked up last year to from $150 to $250 per ton, consisting of a fine gray copper-silver ore, sometimee denominated fahl ore, but for reasone not ascertained it is now lying idle.

The Bell lode, two miles southeaet of Virginia, 1,500 feet in location, ie from seven to eight feet in width, the general formation a yellowish granite. A tunnel 130 feet strikes the ledge 100 feet from surface. The ore consists of both silver and gold, with some galena, and looked upon ae good milling ore, running from $40 to $50, with assays as high as $700. The Sam Tilden, witbin one mile of the city, owned by Messrs. Hanser, Lee and McCauley, a recent location, has a two-foot vein of solid quartz, running up to $900 in gold and silver, the proportion of the former to tbe latter being about as two to one. The O. D. Barrett lead, five miles southwest of Virginia, four feet wide, sbaft 25 feet aud an open cut along the lode 150 feet. Ore thought to be similar to that of the Comstock and bas worked $200 per ton, the full value believed not to have been obtained, as many average sample essays went to $400, with eome as high as $800; owned hy Mr. J. H Pfeil and consists of 2,100 feet.

The Kremliu, five miles northeast of the city, on Granite creek, ledge two and one-half feet, discovered by Mr. N. J. Norwood, and tbe property of Mr. H. Elling, a hanker, and others of Virginia. Has a shaft 95 feet and the ore, free milling, runs from $15 to $100 in gold, working proceee. The Morgan mine, on the same oreek, is located on a ledge of feldspar, with very rich free gold on the foot wall, found mostly in connection with a brown-colored iron, which often runs in emall veins into the spar. It is owned, I understand, by Messrs. Morgan, Thompeon and Dahler, also a hanker of Virginia, and a very recent discovery of great promise. A small quantity has just heen worked in an arastra, yielding $125 per ton in gold, though not considered a satisfactory test, as mucb of the amalgam was left in the crevices at the hottom of the arastra. Some of it, powdered in a hand mortar, turned out as much as $5 per pound, or at the rate of $10,000 per ton.

The Gray Copper Lode,

The property of Messrs. Thompson, Garvey and Barker, about 14 milee from Virginia, near Stinking Water creek, ie one of tbe largest and moet promising silver lodee of thie eection, apparently from 30 to 40 feet in width, as yet but little prospected. It ehows veins of ore from two to three feet thick, rich more particularly in tbe gray copper and hromide of eilver, containing probably many other varieties of eilver ore, such as the cbloride, hlack snlphurets, oxides, etc. It has worked at the rate of a little upwards of $100 per ton, going only to 70 per cent. of the assay valustion. A lot eampled gave average assays of $437 per ton, some running to $623. While in this neigbborhood, a visit was made to the eomewhat celebrated

Puller Hot Springs,

Belonging to Mr. J. W. Puller. In connection with the property there are four springs, two of which are fitted up with very comfortable quarters for bathing. One is intended for a mud hath, the temperature being about 110 degrees, and 10 or more degrees hotter than the others. The water of the bathe contains iron, sulphur, soda, iodine and other ingredients, in the proper proportion, it is eaid, to make it valuable as a curative agency, some very remarkable cures being reported of neuralgia, rheumatism and some nameless diseaees. The spring used for drinking purposes is a white sulphur, similar in character to thoee of Kentucky and Virginia. Near the springs there is a hotel, under the management of J. H. Davis, wbere visitore or patients are accommodated with the best the country afforde.

Before closing this letter, the firet from Montana, I must say, impressions ae to the resources of tbe Territory, mining, grezing and agricultural, are very favorable—the ontlook for the future in quartz heing unusually promising.

A. O. K.

The New British Corvettes.

Half a dozen steel corvettee are forthwith to be added to the navy—swift, well armed vessels, to serve as cruisers. For some time past steel has been regarded by sbipwrigbts with a favorable eye, being tougher and altogether less liable to fracture tben iron, and now the admiralty bas taken the hold step of concluding a contract for building eix war sbips of this material witbout delay. They are to he built on the Clyde, and to be ready for eervice, with their engines on board, witbin two yeers; eo we may expect that for some time, at least, we shall hear no more about the ship building industry in that dietrict being in a depreesed condition. The corvettes will not serve in any fleet along with hig ironclads, but are designed especially for foreign service in Cbina and the Pacific, as aleo for cruising in tbe vicinity of our colonies and foreign poseeesione. Tbey will he remarkably fleet sailers, and, it ie anticipated, will be eble to make 20 miles an hour without difficulty. Their armament is to consist of 14 guns of different calibers, and besides the steel casing, their hulwarks are to be covered with two thicknesees of teak. Tbey will not, of course, he in a position to withstand heavy hattering chargee from hig naval guns, but still ordinery sbot and shell will be unable to penetrate their sides. As their great speed will alwaye enable them to show their sterns and prevent hostile craft from approaching, these eteel corvettee should prove most nseful additions to our navy; and it may eafely he taken for granted that where they are likely to cruise there will he little chanoe of falling in with heavy ironclads, which, hy reasou of the small amount of coal they carry, are unable to trnst themselves very far from land. The corvettes are to measure 2,300 tons, and in every respect are to he built alike. The enginee will naturally he of the most powerful character, to enable so high a speed to he attained, and a etrong armored deck running round the vessel will serve as a protection to the machinery. Such vessele as tbese will he able to perform the specially important eervice of pursuing and destroying the ewift torpedo boats, of which a large number, it is said, is to be introduced into tbe navies of Europe. Veesels as fleet as tbeee torpedo outriggers, ae they are called, will he absolutely necessary if we are to have any protection against such troublesome and deadly craft.—*London Daily News.*

"PYROGEN."—A scheme has been recently devised for supplying London with an inflammable mixture of gases to replace coal. The new gas, "pyrogen," as it is called, is a mixture of nitrogen and carbonic oxide, three-fourthe by weight consisting of tbe latter gas. The combustion temperature of "uyrogen" is etated to be 2,700 degs. Cent., and for heating purposes, the flame of the burning gas is to be allowed to raise some good radiating subetance to incandeecence in an ordinary grate.

A CHINESE RAILROAD.—The purchase by Chinese officials of the railroad at Sbanghai ie an additional evidence that the rulere of the Celestial empire have finally disc.vered that they must adapt themselves to European ideas and macbinery. Though less than ten miles long, it will make tbe Chinese familiar with the management and working of railroads, and will, if rumor he true, eoon he extended to the interior, and thue be the heginning of a great network of iron in Eastern Asia.

Floating Mining Stocks in New York.

The New York *Engineering and Mining Journal* says: The Americsn mining stock board may be made a moet useful and creditable inetitution, or it may become a positive injury to legitimate mining enterpriee, according to the menner in whioh the facilitiee it offere are allowed to be properly used or improperly abused. The high reputetion and good standing of tbe gentlemen connected with the new hoard are guarantees that nothing dishonorable will knowingly be allowed in tbe transactions carried on nnder their auspices; and, indeed, it is eo clearly the duty of every one wbo desires to see mining invectments attracting their deserved degree of attention in this financial center, to protect investors from nnprofitahle, not to say worthless stocks, that we feel tbat we hut echo the sentiments of all when we point out more clearly some abusee which we have already hinted at in our financial articles during the past two weeks.

It seems ecarcely necessary, with intelligent men, to insist upon tbe fact that an undeveloped "claim" or "location" on a mineral vein, even if it he a Comstock vein, by no means constitutee a mine, or the basie for a valuation of millions, or even hnndrede of tbousands of dollars. With thie preliminary remark we proceed to the immediate eubject of our article.

The Grant mining company'e stock hae been the most active on the list since the new hoard first commenced calling stocks. Tbe first week, commencing October 2d, gave salee of 7,000 shares of Grant out of e total of ahout 20,000 sharee of all kinds sold. In the seoond week there were 11,300 ehares of Grant sold, out of a total of 31,000 sharee of all kinds; and for the week juet olosing the number of ehares of thie stock sold wae 12,450, out of a total of 53,000 sheres. The pricee obtained were made to inoreaee from $3 per share at tbe first call to $7 per ehare during the paet week. Such an extraordinary activity in a stock that had never before heen heard of naturally attracted our attention, and the information we have received concerning the company seems to indicate the following as the facts in the caee:

The Grant company owne a "olaim" or "location" of 1,000 feet on a vein eituated in Lyon county, Nevada. The vein ie supposed to he a branch of the Comstock, and the exploration of it consists of a single sbaft of 120 to 150 feet in depth. No euch exploration of tbe vein hae heen made as would prove its continuity or the riobness of the ore; in fact, there is scarcely a mine, hoisting or pumping worke, or improvemente of any kind, and no stamp mill. Assays of samples of ore running from $49 to $2,745 a ton are given, but no etatement is made of the amount of euch ore in sight, nor is any definite information given which proves the property to be worth anything whatever. So far there is nothing mischievous about the matter, it is eimply an undeveloped property which bas been put in a company with a totally unwarrantable capital, and no one underetanding the faote would, of course, give much for etock hased upon so slender a foundation. Having found it impoesible to raiee working capital on the Pacifio coast, where such enterprises are better understood than here, the company hae come to New York to seek for money. Before the opening of tbe new stock board the repreeentativee of the company offered tbe stock at $2.50 a share. On the opening of the hoard it was quoted at $3, and has since sold, as above stated, at prices ranging from $3 to $7 per share, which would make tbe price of the nndeveloped claim from $300,000 to $700,000. An inquiry into the nature of the eales seems to show what brokers call "washed," that ie, the company sells and buys its own securitiee through agents. In other words, it eeems to be eimply a mock auction, in which an interest is sought to be created among investore hy a fictitious activity in tbe stock with the hope of catching some uuwary capitalist, or floating some of the stock, in order to have eome one on whom to make assesements. The whole proceeding, as it appears on the surface, ie entirely disreputable, and if such transactione are to be carried on under the auspices and with the approval of the new board, it requires no prophet to foretell ite speedy diesolution.

We understand that the partiee who are endeavoring to float the Grant mining company hy these questionable means, propose, if successful, to hring out another company in the same way; indeed, they have already commenced quoting this etock.

We are desirous of etrengthening the new mining stock hoard and of interesting capital in what, with proper exercise of prudence and good judgment, is unquestionably tbe most profitable field for investment this country affords. We utterly repudiate, and shall expose all transactione whicb tend to bring mining investments iuto disrepute, and to drag a legitimate, reliable, and very profitable industry into the category of gambling dene or mook auctions, and we heliove the American mining stock hoard will not he slow to aid the good cause by witbdrawing from their liet any stock in which the transactions are of euoh a questionable character.

PRESCRIPTIONS ON THE WING.—A physician of the Isle of Wight has found the carrier-pigeon to he of considerable eervice to him in hie country practice. At every village through which he passes, when hie last patient has been seen, he writee a list of presoriptions for that village, affixee it to the leg of a pigeon, and dispatchee it to his house.

MECHANICAL PROGRESS.

Experiments with Temper in Steel.

Prof. A. S. Kimball, of the Worcester Institute of Industrial Science, writes to the *Journal of Science and Arts* "On Some Changes in the Physical Properties of Steel Produced by Tempering." The following will be interesting to all iron workers: A few interesting, and, to a certain extent, novel results, have recently been developed in our laboratory, which I venture to present in their present incomplete form, since the pressure of other duties will postpone, for a few months, further investigation in this direction. Up to the present time the larger number of our experiments have been made upon the behavior of tempered bars under a transverse stress, although a few qualitative trials have been made upon changes in electric conductivity and coefficients of expansion.

1. "The modulus of elasticity decreases as the hardness of the steel increases; in other words, the harder the bar the greater the deflection produced by a given weight." Many manuals of practical mechanics give a higher modulus for tempered than for untempered steel. Reuleaux, in "Der Constructeur," (p. 4), states that it may be increased 50 per cent. by hardening. Coulomb and Tredgold state that hardening has no influence whatever, while Styffe finds that the modulus is diminished. For our first experiment, five pieces of good tool steel, each 13 inches long, were cut from a half inch square bar. These were carefully annealed, squared and polished. No. 1 was laid aside, and the others were hardened in cold water in the usual manner; No. 2 was "drawn" on a hot plate to a dark blue; No. 3 to a purple; No. 4 to a straw color; No. 5 was left hard. The modulus of elasticity was then determined by measuring the deflection produced by a weight applied to the middle of the bar. The probable error of the experiments did not exceed one-fifth of one per cent. The experiment was varied in many ways; several qualities of steel and bars of different dimensions were employed, with uniform results. In some grades of steel a difference of more than 10 per cent. has been found between the modulus of the hardened and that of the annealed bar.

2. "The increase of deflection in a given time is greater the harder the steel." It is well known that the deflection of a bar left under stress will increase for a long time. I am not aware, however, that comparative tests of the rate of increase in steel of different tempers have previously been made.

3. "The immediate set increases with the hardness of the steel." In the experiments each bar was of course loaded with the same weight, which was allowed to act for the same number of minutes.

4. "A bar recovers from a temporary set with greater rapidity the harder it is." The remarkable fluctuations in the line of the bar observed by Prof. Norton became more marked and had a wider range as the hardness of the bar increased.

RUSSIA IRON.—Baron de Wagstaff, a heavy manufacturer of Russia sheet iron, and now on a visit to this country, emphatically denies the widely accredited report that the secret of the manufacture of this iron is possessed solely by the Russian government, or that it is guarded with rigorous jealousy. He states that four-fifths of the polished sheet iron made in Russia are manufactured at private works; and whilst it is true that all efforts heretofore made in this country to produce an article equal to theirs have failed, nevertheless there is no chemical or other like secret connected with its manufacture; nor is there any peculiarity in Russian ore that gives them the power to maintain their superiority, for at the many private works where these sheets are produced various ores are used. The whole "secret" is in the mode of manipulating the iron at a certain stage of the manufacture, which has been invariably overlooked by those who have attempted it in this or any other countries. While withholding a description of this manipulation he states that no success will ever attend the efforts to manufacture from coal-pigs or puddle blooms, that any trace of sulphur or phosphorus in the iron is fatal to a good result; and he adds that he should experience no difficulty in producing the very finest Russian sheet iron at existing works in many parts of the United States. Cannot some of our analytical metallurgists solve this important secret?

UTILIZING THE RECOIL OF GUNS.—The idea of utilizing the recoil of a gun on discharge to make it retreat under cover, says *Iron*, was for the second time put to a practical test last week at the proof ground of the Royal arsenal. The curved railway laid down for the purpose some months since was again used; but the sharpness of the curve had been somewhat reduced, and the straight run at the commencement of the recoil extended. The trial was more successful than the first, the gun, when fired with moderate charges, retiring round the corner out of sight; but when put to the severe trials which are sometimes required of guns on service, it failed to keep its place on the rails. Some further modifications will be made in the arrangements and another trial will be made.

STEAM TRAMWAYS.—Tramway-cars drawn by steam are now run daily through the streets of Brussels, and in at least one other Belgian town.

Boiler Making by Machinery.

The riveting of boiler plates is being brought within the region of machinery. The *Technologist* gives a description of a steam riveter now in use by the Erie City iron works as follows:

The main body of the machine is a standard heavily braced and extending below the floor over five feet, to receive the heavy post or "man," which is fitted to its front side, and securely held in place by bolts and a very heavy wrought iron band (shrunk on) around the whole machine. The steam cylinder and valve are bolted to the opposite side of the standard, the top of which serves as a guide to the piston rod, which is eight inches diameter, and does duty as a ram. The top of the post and end of the ram have each three holes for the reception of dies. These dies are of steel, their faces countersunk to form the heads of the rivets, and are usually placed in the center holes, unless required to work in a corner (as in the furnace of a locomotive), when they are moved into one or the other side holes as required. They are also so arranged as to admit the riveting of a head to the shell, or angle iron to a plate. The valve is balanced and worked by hand, giving the operator perfect control of the movement of the ram and force of the blow. The work to be riveted is suspended by a swivel and chain, and raised or lowered between the dies by any suitable device.

The method of riveting is as follows: The plates being in position between the dies, a light blow is struck to "set up" the iron, and insure perfect contact. The rivet is now inserted, and a slow crushing blow is delivered, the whole pressure being allowed to remain on the rivet an instant till it has partially cooled, when a quick sharp blow is given, and the work is done. The cylinder is 36 inches in diameter, and with 50 pounds of steam this gives a blow or pressure of 50,000 pounds. This enormous force upon the hot, soft rivet, upsets it perfectly without injury to the iron, and leaves it better and stronger than a hand-driven rivet, which becomes more or less crystallized by hammering. Two of the points essential to good riveting are, as already stated, obtained by this machine. It is adapted for both light and heavy work, and is suitable not only for all kinds of boiler work, but also for bridge and ship work. It rivets plates 60 inches wide, and weighs about 22,000 pounds. With this machine shells of boilers from one-fourth to five-eighths of an inch in thickness, and heads from five-sixteenths to one inch thick, have been riveted.

Wire Tramways.

Now that wire tramways have been proved valuable on this coast by the success of Mr. A. S. Hallidie's patents, it will be interesting to read of their introduction elsewhere. Our London exchange, *Iron*, writing of this subject says: It will at once be seen how, with such capabilities, the tramways, instead of taking circuitous routes in order to obtain an incline of not more than one in six, the original limit, can now be laid in a direct line, passing up the sides of hills, which would otherwise prove impracticable, in cases where ravines occur, too wide to allow of the ropes being stretched across in the usual way, the tramway can now descend the sides. A good example of a wire tramway working on a steep incline may now be seen daily at work at the flannel works of Messrs. Butterworth & Co., near Rochdale, where it is employed to carry coal from the mine situated at an elevation of about 500 feet. The line is laid direct from the mouth of the mine to the boilers of the factory, and is about 500 yards in length, thus descending at the rate of about one in three. The coal is carried in loads of one and a half cwt. in wooden boxes, and, owing to the great incline, no power is required to keep the rope in motion. A quantity of five tons per hour is transported, and only the labor of two men is required. Similar lines are in operation at the works of Messrs. Norton Brothers (limited), near Huddersfield, where the tramway in its course passes over a great part of the works, and carries the coal direct from the pit mouth to the boilers, it being filled from the pit corves into the tramway buckets by means of a hopper and a slide, which enables one man to do all the work required. This tramway derives its power from the mill shafting. Another useful application has been made at the sugar works of James Duncan, Esq., for the purpose of carrying coal from the side of the Thames, where it is brought in barges, to the interior of the works, a distance of about 150 yards—throughout its course it passes over the various buildings and roadways, which are now left free for the regular traffic of the works. The cost of carriage of the coal at these works has been greatly reduced by the use of this tramway.

NEW TRANS-MEDITERRANEAN CABLE.—At a special meeting of the Eastern telegraph company, held recently, a resolution was passed authorising the directors to acquire and carry into effect at a cost not exceeding £100,000, the concession from the French government in reference to the new submarine cable from Marseilles to Algeria, and the land wire through France, with any modification which may be approved by the board.

SCIENTIFIC PROGRESS.

Meteorology.

The most important publication that has come to hand since the beginning of the year is the fine volume issued by the Smithsonian Institution under the title, "Tables, Distribution and Variations of the Atmospheric Temperature in the United States." These temperature tables are based upon all available thermometric observations made in the United States and Canada previous to the year 1871, the estimated number of which will not fall below 11,000,000. The labor of discussing this great mass of observations and of deducing some general results has been ably performed by Mr. Charles A. Schott, of the Coast Survey office, to whom science has also been indebted for the Smithsonian rain tables and for many other special works in meteorology. Three large charts accompany this work, showing the distribution of surface temperature for the summer, the winter and the year. Numerous smaller plates illustrate the daily and annual fluctuations of temperature. Mr. Schott finds no perceptible secular change in the temperature of the country, nor any decided connection between our temperatures and the variations in solar spots. For 10 stations the mean temperatures have been computed for every day of the year, and it appears from these that changes in the normal temperature of any day extend over large tracts of country, and progress in an easterly direction. All the stations agree in showing a rapid rise in temperature about the 20th of February. There are also indications that the hottest and coldest epochs change somewhat from year to year, making a complete circuit in 70 years through a range of about six weeks. On comparing the average direction of the wind with the average temperature, it appears evident that for years of northerly winds the temperature is lower, and for southerly winds is higher, so that secular changes in local temperature are attributable to corresponding changes in the direction of the wind. These latter changes, on the other hand, must be a part of a system of oscillations in the general currents of the atmosphere, which may possibly be ultimately due to slight variations in solar radiation.

Although the Smithsonian tables approach so nearly to being an exhaustive compilation, yet there are continually being brought to light hitherto unknown series of observations, some of which will be worthy of future publication. Of this character is the extensive work done by Engelmann in 1859, as metsorologist to Simpson's explorations in Utah. His report on the hypsometric results of these observations has just been published by the Army Engineer bureau, and forms one of the best contributions that the army has made to the subject. In this report Engelmann gives a very lucid explanation of the influence that vapor exerts in affecting the diurnal variations of temperature on the Western plateaus.—*Harper's Magazine.*

THE WILHELMSHAFEN IRON WORM.—A correspondent of the London *Times* has come across a gentleman at Wilhelmshafen, a sea captain, who has made an interesting discovery in natural history. This fortunate gentleman has not succeeded in bringing home a joint of the sea serpent or a photograph of the kraken; but he has discovered that there are worms which destroy—*i. e.*, eat and devour—iron. "I casually," says the correspondent, "by way of joke, in reply to a kind invitation he gave me to stay at his house, said I would come some day with a microscope to examine the worm which was destroying the German ironclads. His face clouded, and our conversation became very earnest. He returned to the subject again, and asked me if I seriously meant what I had said; and then he told me that there was considerable fear that there is a worm in Wilhelmshafen. He himself had discovered that there were worms which destroyed iron. It is well known that Wilhelmshafen, one of the most valuable ports existing, was long useless on account of a wood worm which destroyed every ship that entered its waters."

CHEMICAL COMPOSITION OF THE BRAIN.—According to Mr. Gobley, the following is the chemical composition of the brain:—1. The cerebral matter of the brain of man contains 80 per cent. of water. 2. It contains two albuminous substances, one soluble in water and resembling albumen, the other insoluble in water, and for which the author proposes the name "cephaline." 3. The fatty matter of the brain is formed chiefly of cholestarine, lecithine, and cerebrine; it contains also traces of olein and margarine. 4. The brain contains the usual salts and extractive matters of the animal economy, of which a part are soluble in water and alcohol, and a part are soluble in water but insoluble in alcohol. 5. During putrefaction the cerebral pulp furnishes various products, among which are found oleic, margaric, butyric, glycerio, and phosphoric acids.

PRIZE.—A prize of 2,000 livre ($400) is offered by the authorities of Reggio, in southern Italy, for the best apparatus for extracting the essential oil of bergamot, the conditions being strength and cheapness in the apparatus itself, combined with capacity for producing the largest quantity of essence in the shortest time, without detriment to the color, purity, and fragrance of the product.

Acoustic Attractions.

M. Dvorak has examined the attractions and repulsions of small pendulums hung near sonorous bodies, as reported by the *Journal of Physics*. A square of paper or a piece of cork is hung by a silken thread, and held near a wooden rod vibrating slowly. Varying the positions of the pendulum it is sometimes attracted and sometimes repelled. These motions seemed to be due to the air-currents approaching or receding from the rod, and the motions of the cork served to determine approximately the directions. These results were verified by the motions of a flame and the indications of a very sensitive water manometer. The air thrust aside by the vibrating rod escapes laterally, repelling light bodies. This is replaced by air forming counter-currents toward the rod, producing the effect of attraction. When the amplitude of the vibrations is small, the rod acts like the prongs of a tuning-fork, and attraction takes place in every direction.

In front of the opening of a tube of Kundt is placed a second open tube, giving the same sound as the first, and suspended by two threads. Making the first tube resound loudly, the second tube is strongly repelled. The same effect is obtained if the second tube gives one of the harmonies of the first. Placing two tubes facing each other opposite the tube of Kundt and perpendicular to its axis, they tend to approach each other. With a very sensitive manometer it appears that in a column of air in a state of permanent vibration, the air at the nodes has an excess of pressure. This accounts for the heaping up of water in the loops of a tube of Kundt. It is explained by admitting that the amplitude of the vibrations can not be neglected compared with their length. It follows that there ought to be a continuous motion of the air from a node to a loop. This might be proved by filling the resonant box of a tuning-fork with the fumes of chloride of ammonium and seeing if they are thrown out when the fork is set in vibration.

If a bell is filled with water and a drop of oil allowed to fall on it, the circular film becomes quadrangular when the bell is sounded. The water-currents start from the nodes and accumulate at the loops. A disk of glass is attached to the end of a rod vibrating longitudinally. If a glass drop is hung opposite the disk, it will be repelled at the center and attracted around the periphery. There are then, as with air, currents outward at the center, and counter-currents inward along the edges.

Air in Mines.

At the last meeting of the North Staffordshire mining institute, a paper by Mr. Wardle, of Burslem, was read on this subject, which is summarized by *Iron* as follows: Mr. Wardle said the temperature of the earth increased as they descended at about 1 deg. Fah. for every 50 feet to 60 feet. At the deep coalpit at Dukinfield the temperature was constantly 75 deg. Fah. at a depth of 2,151 feet, and at a depth of 17 feet it was only 1 deg. Fah., which gave an increase of 1 deg. Fah. for every 89 feet only. The average degree of temperature of the earth was 1 deg. Fah. for every 55 feet in descent to a depth of 1,800 feet, and afterwards 1 deg. Fah. for every 44 feet. At 10,000 feet the temperature would be 212 deg. Fah., provided all other circumstances remained the same; at 20 miles, 1760 deg. Fah.; and at 50 miles it would be 4600 deg Fah., heat sufficient to melt any known metal. Thus, the deeper the shafts of their coal mines, the greater the amount of natural ventilation they would obtain. A current of air, traveling at a speed of 10 feet per second, gave a pressure of .492 lb. to the square foot; at 16 feet, =.989; at 51.34, =6.027; and at 200, =39.2, as experienced on the surface of the earth. These might be described as: first, a breeze; second, a light gale; third, a gale; and fourth a hurricane. Increased velocity of wind meant greater friction or higher water-gauge. Air was perfectly elastic; by pressure it could be squeezed into less bulk; and if that pressure were withdrawn, it filled the same space as formerly. Heat had the same effect upon it as pressure. A cubic foot of air weighed 523 grains; a cubic foot of water weighed 1,000 oz.; a cubic foot of watery vapor weighed only 272 grains. So that the more vapor there was in the air the lighter it would be. Friction was estimated by the force required to overcome it. Friction of air increased or decreased in the same proportion that the extent of the rubbing surface exposed to the air increased or decreased. A circular airway offered less resistance in proportion to its area than any other form, because its circumference was less in proportion to its area than the perimeter of any other figure. Airways should be as large and with as smooth a surface as possible. Splitting the air current was preferable to taking the whole current of air round the workings in one body. Generally speaking, splitting the air increased the quantity of air obtained by a given expenditure of power, but the benefits to be derived from splitting were limited by the area of the shaft.

HUXLEY'S VISIT.—Prof. Huxley, says the *Technologist*, was most pleasantly treated during his recent visit to this country. The railroad presidents gave him palace-car journeys without price, and for each of his three lectures at Chickering hall he received $1,600. He was also offered but declined $500 for his address at the opening of the Johns Hopkins university. He carried back to England as the result of his few weeks' visit the agreeable sum of $5,000.

Mining Share Market.

Very little haa been done in tha stock market this weak. On Monday afternoon tha San Francisco board adjourned and did not meet again nntil Wednesday morning. Even than tbe closely contested race for tha Presidential cup absorbed all attention. Had the result of the election been definitely understood, stooks might possibly hava ooma in for a fair shara of interest. But the axoitement rnled so high, as first one and then the other of the candidates was announcad to be ahead, that all speoulation, except on the issue of the oanvass, was pratty effectnally praoluded. It is now generally conceded that nothing can resoua tbe market from continned stagnation bnt the uncovering of fresh bonanzas. Thesa wonld inoite speculation and furnish a baokbona to affairs that wonld warrant bigher prices and brisker times. When those baving control of certsin leading minas have ceased manipulating tbe market and delivered the stock shorted, they will probably be prapared to show their hand. Until then tbe speculating commnnity can only look for a continnation of the past. Tha Virginia *Enterprise* says tbere bave been no marked changes during the week past, for tha devalopment of a mine is a thing of slow growth. Tbe great obstacle to be overcome in prosecuting tha work is water. Tbis gives more tronble than anything else. It is especially tbe one great obstacle to be overcome in deep mining, sucb as is nacessary to success on and along the Comstock. There has been a great deal said during the past week about tha water in the Con. Virginia mina, and the result of striking the pooket has been greatly magnified. Such pockets are oommon all along tha lead and are considerad one of the first indioations of having encountered a fissnra vain. In snob veins our ore is found.

We call the attention of our readers to the fact that we now publish the summary of news from the Comstock a week later by date than formerly, tha Gold Hill *News* having made arrangaments witb us by which we are able to do so.

Discovery of a Cave.

Tbe following is from the Eureka (Nev.) *Sentinel*: Some prospeotors hava recently discovared and are now engaged in prospeoting an extensive oava in Prospect mountain. Tha month of the oava is on tha sonthaast sida of the mountain, about 200 rods south of tha mouth of tha Prospact Mountain tunnal, and oonsists of a small apertura in tha top of tha gronnd. Through this apertnre a man was lowarad, fastened to a rope, and found himself in a larga dome-shaped chamber. In the floor of this chamhar ba disoovered another opening, leading downward further into tha ground, but this apertnra was not at that time antered. Subsequently a tunnel was rnn into the mountain from the snrface at this side, which openad an entranca into the chamber which tha man bad entered, and bere a windlass was put up and further axplorations commenced. The man was lowered down for a distance of about 100 feet, when he rested on the floor of a large cavern, distant from tha natural antranca of the cave at tha snrface about one bundred feat. On tha floor of this oavern was piled a hank of snow about eigbt feet in depth, and bara were found the skulls and hooes of ooyote and dear. Some of thase bonas, which ara covered with mud, dried on them, were bronght to town by Mr. Berg, and can be seen at tha stora of S. Goldstona & Co. Thare is a third apertura laading into the ground from this oavern, whioh will be explored by the parties who disoovared and are workiog the cave. There is a possibility that a mine may he enoountered in the explorations, as Prospect mountain is vained and dottad with minaral daposits, and if ora is found the parties who find it will have a ready-made shaft to work tbeir mine with.

THE Virginia City *Chronicle* of the 2d says: The employees of tbe Con. Virginia and California mining companies will be paid to-morrow $106,378 in gold There will be paid to the employees of the Utah mine to-morrow $4,783; Best & Belcher will pay $3,231; Gould & Curry, $21,900.

MINING SUMMARY.

THE following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

AMADOR.

THE TALISMAN MINE.—Amador *Ledger*, Nov. 4: A few days since we paid a visit to this mine, situated on the ridge between Sutter Creek and Amador City. The operations have been confined almost exclusively to the drainage of the shaft. The very best kind of pumping machinery has been fitted up, and the work of taking out water has been going on for many weeks. At the time of our visit men were engaged in grading a piece of ground close to the main road, for the erection of a mill, for which a quantity of lumber was already on hand. Mr. Treglown, superintendent of the works, and under his able supervision there is little doubt that a valuable mine will be developed in the course of a few months.

MECHANICS' MINE.—Amador *Dispatch*, Nov. 4: Work upon the Mechanics' mine, at Sutter Creek, has steadily pushed forward until they now have their hoisting works and machinery nearly finished, and will be ready in a few days to turn on a full head of steam and take the water out, which will only occupy a few days. From what we can learn, this company have a valuable mine, all the stock of which is owned in this county, and the parties interested are just the kind of men to push matters ahead in a successful manner. They have a good ledge in the bottom of the main shaft, and have opened out on the ledge about 50 yards south of the main shaft, with very encouraging prospects. We wish them success.

BUTTE.

THE STORM.—Butte *Record*, Nov. 3: The storm that came on last week was one of the most severe that ever visited this part of the State at so early a period in the season. In fact, many of the old residents claim it to have been the severest they ever knew in the month of October. The river rose quite rapidly, and all day Friday large pieces of the Centennial company's flume were seen floating down its muddy waters. We learn that the banks of the Spring Valley company's canal were broken in several places in Hamilton township, and the waters spread out over the ranches, giving it the appearance of a vast sea. Whether or not any damages were done to the ranches we have not learned. The mountain roads in many places were rendered impassible, and will have to remain so until the spring opens, unless a long spell of dry weather intervenes. On the Oroville road bridges were washed away, and teams are delayed in the mountains until such time as extensive repairs can be made to enable them to cross the West Branch.

CALAVERAS.

BIG CLEAN-UP.—Calaveras *Chronicle*, Nov. 4: Emerson, proprietor of the Happy Valley hydraulic, has just finished cleaning up after a short run. We haven't seen the "hoss," yet, but we understand the yield was very close to $6,000. That is the best clean-up made in this vicinity, for the length of the run, since gold was more plentiful than it is at present. Emerson deserves a good claim, and don't you recollect that we have repeatedly told you that he has got it?

RICH ROCK.—Fifteen tons of quartz from the old Holmes mine, situated on the Mokelumne river, a short distance from Mosquito gulch, yielded $525, or an average of $35 per ton. The ledge is a very wide one, and is undoubtedly as promising a vein as there is in the county. There is no question but that the ledge if developed would prove a first-class mine.

GWIN MINE.—Operations are being urged forward with usual energy at the Gwin mine. The stopes from the 1100-ft level keep the batteries in constant motion, with satisfactory results. The 1200-ft south level is being driven, uncovering a very wide ledge of fair grade ore. It is gratifying to be able to state that the ore body shows no diminution in volume as a greater depth is reached.

HERALD MINE.—The work of sinking the shaft in the Lamphear mine progresses without interruption, and the mill is kept steadily employed. The outlook is wholly encouraging. Stoping and running the south level have been temporarily suspended, owing to the scarcity of timbers.

UPPER CUSTOMY SPLINTERS.—The Deuteronomy mine, at West Point, has just finished a crushing of 30 tons of rock in Henry's mill. We don't know just how much it paid, but it was somewhere in the neighborhood of $35 per ton. Good yield, that. Osriton's mill will commence crushing rock from the Champion mine next week. There is from 75 to 100 tons of ore now on the dumps. The mill at the Mina Rica is to be started just as soon as water sufficient for motive power can be obtained. Another rain will set the stamps in motion. The mill at the Josephine was lately cleaned up, after quite an extended run. We learn that about the usual yield was obtained. W. V. Clark, Esq., of Railroad Flat, is cleaning out his ditches and getting prepared for an energetic winter campaign. He intends opening a monster hydraulic at Independence this fall. Operations are progressing favorably at the Glencoe Con., in Mosquito district.

EL DORADO.

THE ST. LAWRENCE.—*Mountain Democrat*, Nov. 4: Reports from the bonanza in the St. Lawrence continue to be highly favorable. The ledge is widening and the quality of the ore is, if possible, improving. The best evidence of the promising appearance of the ledge is afforded by the fact that within the past week the workmen in the mine have become purchasers of 1,000 shares of the stock. Superintendent Roeswarren, by his systematic preparations for a thorough development of the mine, is demonstrating his superior knowledge of his business, and winning golden opinions from all concerned. He is a close economist, but leaves nothing undone. Some of these days we shall attempt to give a statement in detail of the amount of work he accomplishes in a given period, with what force and at what expense, and in this connection we shall issue a friendly challenge to other mining superintendents in all portions of the State.

INYO.

BRIGHT OUTLOOK FOR LOOKOUT.—Coso *Mining News*, Nov. 4: We are glad to be able to inform our readers that, from an interview with Mr. James Morton, one of the directors of the Minnietta Belle Consolidated silver mining company, at Lookout district, the prospects for that district are of the most promising character. He has been spending several days at Lookout, inspecting mines, and is very much elated with the fine showing in the mines of the Minnietta Belle and Mountain View, a report of which, from their able Superintendent, we publish to-day. A large percentage of their ores are of the milling character, as has been proved by Mr. R. C. Jacobs, who, during the present week, put through his mill at Panamint five and a half tons of the average ore, worsing the same above 80 per cent. of the assay, its value in silver much exceeding the expectations of all. Mr. Joseph McDermott reports that he visited the Little Moe mine, situated but a short distance from the Modoc mines, and says the prospects are very flattering for a good mine. He brought in a large number of samples taken from some 20 different parts of the mine, which are very fine indeed. Assays will be made in a day or two, and we shall be disappointed if they will not average as high as the Modac and Minnietta Bell.

MINNIETTA BELL.—We received the following report from the Superintendent of the Minnietta Belle Consolidated silver mining company: After having taken five and a half tons of ore to Sunrise mill and working same by simple mill process, I am pleased to say that results are most flattering. Much doubt has hitherto been entertained as to its possible success. That doubt is now removed, having realized up to our guarantee of 80 per cent. The present five-stamp mill will be removed to our mine immediately and five more stamps added, orders for the additional machinery having been forwarded to San Francisco, and everything will be in running order ere 1877 dawns upon us. Considering that 2,000 tons are already extracted and lying on the dumps, and that vast amounts are still imbedded, yet thoroughly opened up for extraction, also the cheapness for which it can be mined and milled, we can safely say that our stockholders will be handsomely rewarded for their investments. The mines are in first-class order and looking well at every point. We have commenced our wagon road to connect with the Modoc road, which will pass by our ore dumps, thereby connecting with Panamint Valley road.

PORTOIS FURNACE.—Mr. P. Portois arrived here from San Francisco a few days ago, and has already made arrangements with J. H. Rawlings and Thomas Moran to at once commence the work of erecting the furnace. The machinery is all here, and Mr. Portois thinks he can have it ready to run out bullion by the end of the present month. He says he has about 1,200 tons of ore on the dumps of the Hidalgo mine. The furnace will be of 30 tons capacity.

KERN.

BUNNEL MINE.—Kern County *Courier*, Nov. 4: Hon. A. C. Lawrence arrived from the Bunnel mine on Monday. He reports the utmost good feeling among the owners of the disputed mine, growing out of the late compromise. The mill erected by Mr. Harley for the company, at a cost of $72,000 will begin its work immediately, and 100 men will be put to work on the mine. The mill has already a large supply of ore, which will yield $3,000 per day. It must prove of immense benefit to the county.

NEVADA.

A LONG CUT.—San Juan *Times*, Nov. 4: For several months past Evan D. Evans, Wm. W. Williams and Jas. Reader have been engaged in excavating a cut from the river near Jones' bar to a point above, known as Johnson's ranch, for the purpose of washing off a large piece of flat ground lying immediately in front of Bunker hill. The cut is 2,230 feet in length, seven feet wide at the bottom and from twelve to 15 feet in depth from the surface. The cutting through solid bed-rock is four feet in depth nearly the entire distance. An immense quantity of giant powder was used in the excavation. The ground to be washed away is only 12 to 15 feet in depth from surface to bed-rock, and covers about 30 or 40 acres of land. It has been thoroughly prospected and is rich with the glittering ore.

MOORE'S FLAT.—Cor. Nevada *Transcript*, Nov. 4: We have had some very heavy rain storms within the past fortnight, but as yet have had no snow to speak of, but there is lots of it in sight, on the mountains above. Water is plenty and our miners are caving down the high banks at a lively rate. The Eagle company is making preparations to start their mine up, and intend to run all winter. This is a good mine, but has been lying idle for some time. Several mining experts have paid this place a visit within the last week, and if we are not badly mistaken, some of the bonanza kings are investing in our gravel mines. The Blue Gravel company is running a drain tunnel, and will put a pump in the shaft the coming week. The tunnel will tap the shaft at a depth of 200 feet. Blue Gravel stock is coming up and in demand. Our town people are laying in a big supply of provisions for the winter. They were caught out last winter and had to carry their provisions on snow shoes from North Bloomfield, but they won't be caught napping this time,

PUSHING AHEAD.—*Foothill Tidings*, Nov. 4: At a special meeting of the Washington gold mining company, held on Tuesday evening last, it was resolved that heavier works be put on at once and the explorations be pushed down ward without delay. This mine is situated on a line with the Idaho, and so far as proved shows encouraging symptoms of a first-class ledge when opened up to proper depth. We are glad to note this determination on the part of the company to push the work.

PLACER.

NEWLY COMPLETED.—Dutch Flat *Forum*, Nov. 4: The reservoir of the South Yuba canal company, near Alta, is nearly completed. It is built in a very substantial manner, and there will not be any trick in filling it the first season. This reservoir will be a great convenience in distributing water to the various claims in this section, and will save the company much water which otherwise would be lost.

MINERS' MEETING.—We mentioned a week or two ago that some of the mining companies in the upper part of the county had reduced the wages of their employees. We see from the *Forum* that the miners of Dutch Flat have held a meeting to protest against such reduction. The *Forum* says: On motion, a committee was appointed to draw up a protest against the reduction of wages, to be signed by all the miners, and presented to the superintendent of the different claims. S. A. Hane, J. Pascoe and Wm. Morehead were appointed as the committee. On motion, a committee was appointed to draft by-laws and rules, and make necessary arrangements for forming a miners' union. The following committee was appointed: J. Constantine, J. Oliver and J. Bennetts. At this point a communication was handed in by S. B. Harriman. It was signed by all the superintendents of the claims at this place and adjacent mining towns, asking the miners to refrain from establishing a union, as all who joined or who had anything to do with it would be discharged, and not employed by any of them hereafter. After a brief discussion followed, Mr. Holmes made a motion to adjourn *sine die*, but it was lost. On motion the meeting adjourned, to meet at the call of the committees appointed.

PLUMAS.

THE FRANKLIN MINING COMPANY.—Plumas *National*, Nov. 4: Sufficient developments have already been made to demonstrate the fact that a very rich deposit of fine gravel lies under the mountain on the north side of the Middle fork of Feather river, opposite Nelson point, and that it extends to the Willow Ranch basin, if not further. The blue gravel claims of Metcalf, Porter & Co. have been thoroughly prospected by tunnel, and the pay found was sufficient to justify that company in going to a great expense, digging ditch, putting up hoisting works, sinking shafts, etc. The company hope to be able to get their shaft to bedrock within the next two months. Adjoining the above mines and upon the same lead are located the Mary Johnson, Mendocino and Tip Top claims. The owners of these claims being unable to open them, a company was formed and incorporated under the name of the Franklin mining company, with a capital stock of $60,000, and an agreement entered into by that company and the owners, by which the Franklin agreed to sink a shaft and develop the claims, and to receive in return a deed to a certain share of the ground. Mr. Frank Johnson was one of the original locators, and mainly through his efforts the company was incorporated and the arrangements made. Last fall the Franklin company commenced work, and succeeded in sinking the shaft, size 6x12 feet, to a depth of 75 feet. When that depth was reached the last blast that exploded suddenly opened in a vein, and such quantities of water came in that, with the engine and pump then in use, it was found impossible to keep the shaft free. Since that time but little work has been done. The company expended about $8,000. A few weeks since Mr. Locy, of the well known firm of Parke & Lacy, of San Francisco, was induced to examine the ground, and he was so well pleased that, after consulting with his partners and one or two other capitalists, they made a proposition to the company to furnish engine, boiler, etc., for sinking the shaft for a certain amount of stock. The offer was accepted, and the machinery and supplies are now on the road. Mr. I. N. Knapp is the general superintendent, and he expects to be able to commence sinking again within a few weeks after the engine, etc., is upon the ground, which will be in a few days. If in sinking, pay gravel should be struck that will pay equal to that in the claim adjoining, and we do not see how it can be otherwise, it will open one of the grandest gravel claims in northern California, and its value can hardly be estimated. We trust that the most sanguine expectations of the owners will be realized. The success of the Franklin will add much to the wealth and prosperity of the county. It will cause a new mining camp to be built at Willow Ranch, and it will also act as an inducement to encourage more prospecting and the opening of more mining claims in that vicinity.

GOLDEN ENTERPRISE.—From Mr. R. Jacks we learn that matters at his mine on Spanish creek are moving along "swimmingly," and that his Chinamen are about finishing up their contract for the big cut in which the flume will be placed. Dick is getting some fine prospects, and will have everything in readiness for the coming water season and in good time to make money. We shall pay a visit to the mine in a short time, and will then be able to give an extended description of the improvements.

HEAVY STORM.—As we go to press (Friday) the rain, which has been coming steadily for 24 hours, still continues, and there is every prospect of a small sized flood. It will prove destructive to many farmers in the county whose crops are in the field or the stack, and considerable loss will be the result. On the other hand the miners will get a full run of water which will be of immense benefit to them. "What's one man's food is another man's pizen." An immense quantity of freight is on the road for this country, and the teamsters are catching it heavily.

SIERRA.

SUSPENDED.—*Mountain Messenger*, Nov. 4: Work has been temporarily suspended for want of wood at the Keystone mine.

THE BELL MOUNTAIN company are reported to be working three shifts on their main tunnel to make room for an increased force of men when the locomotive arrives. It is now due in Marysville.

SISKIYOU.

AT WORK AGAIN.—Yreka *Union*, Nov. 4: Much fear was expressed by the friends of Bean & Co. and Kettlewood & Co., who have claims in the bed of Klamath river, that the storms of the past two weeks would raise the water in the river so that they would have to quit work for this season. This, when both companies had just begin to pay largely, would be a great hardship, and we are glad to say that they have not had to quit. When the river commenced raising, they let the water in and flooded their claims, so as to prevent as much pressure as possible on their wingdams. This has had the desired effect, and the claims being saved, they were enabled by putting out their dams to go to work at the pay dirt again. As soon as the water began to fall again the pumps were set to work and now both these claims are all right again. The claim of Bean & Co. had paid very rich for several weeks before they were compelled to quit work by the storm, they taking out, we are informed, as high as 30 ounces a week. They got six ounces in the last pan of dirt they took out before they let the water in. They no doubt are taking it out in the same ratio again. Kettlewood & Co.'s claim had not paid very well until just before they let the water in, when they struck it very rich again. They are no doubt by this time again taking dust out in large quantities.

ALL RUNNING.—From Messrs. Nally, Melton and others, of Sawyer's Bar, who were in town yesterday, we learn that the Klamath, Morning Star and Evening Star mills have started up again and now all the mills in that section are running. We learn also that at the Klamath excellent rock is being taken out and the prospects are that this mine will pay very well this winter. Our informants did not know what the prospects of the Morning Star were, but presumed they were also good. The Evening Star always pays, and when they commence milling they always commence taking out money. The same gentlemen also informed us that there was about a foot of snow on this side of the Salmon mountain, between the cabin and the summit, when they came over.

Nevada.

WASHOE DISTRICT.

CALIFORNIA.—Gold Hill *News*, Nov. 9: Daily yield, 400 tons of ore, keeping the mills steadily running. The bullion yield of the mine for the month of October will not fall much, if any short of $1 250,000, although last evening the bars of bullion had not all yet been stamped so as to show the precise result. A surplus was carried over from last month, so that all expenses are paid and the company can without trouble pay the usual dividend of $1,080,000, and still have surplus to add to the November account. The ore breasts are yielding rich ore at all points. The south drift on the 1600-ft level is in a distance of 170 feet, the face still in fair ore, although not of so rich a character as that recently penetrated by the same drift. The west drift from the 1650-ft station of the C. & C. shaft is now in a distance of 200 feet, the face in good running ground and the drift steadily advancing at the rate of 10 feet per day. This drift will have about 600 feet to run to reach the main ledge. A pump tank and station is being put in the C. & C. shaft below the 1650-ft level, pending the completion of which the sinking of the shaft is suspended. The new side track and ore dump for shipping ore to the Carson river mills is finished.

CON. VIRGINIA.—The extraction of ore was slightly interrupted during the first part of the week by the water which we reported struck last week on the 1400-ft level. That has been drained, however, and the usual amount of ore is being again extracted. There has been no change in any of the ore breasts or prospecting drifts during the week. The flow of water did not alarm the mine and proved to be only a small pocket lying on the east side of a heavy clay slip, which, giving away suddenly, let the water in with a rush. The bullion yield for the month of October will not vary much from $1,350,000, which will pay all running expenses, and leave a small surplus after paying the usual dividend of $2 per share, which was declared on the 3d inst. Owing to the flooding of the main drift on the 1700-ft level of the Gould & Curry and Best & Belcher, driving the north drift on the 1700-ft level has been suspended for a day or two past. Everything will be in good repair and it will be again advancing as usual in a day or so more.

JULIA.—The south drift on the 1800-ft level is still showing a decided improvement. The quartz is more concentrated and of a livelier, better character. The south drift on the 1600-ft level is running to connect with the Ward shaft, and must in its course strip quite a large portion of the ledge ready for cross-cutting whenever the management desire to do so.

IMPERIAL CON.—The south drift from the bottom of the south winze on the 2135-ft level is being pushed rapidly ahead, the face in soft ledge material. The face of the north drift from the bottom of the same winze is also in quartz and favorable ledge formation.

HALE & NORCROSS.—The east drifts on the 1500-ft levels are showing more and more favorable for a valuable ore development in that direction. The east cross-cut from the north drift on the 1400-ft level is also looking more favorable.

HERALD.—Sinking the main incline is making excellent progress. It is now down 182 feet, almost the entire bottom of the shaft being in quartz and ore of a fine character. Much of the ore is rich, many of the best pieces being filled with fine threads of wire silver, and the assays ranging from $100 to $3,600 per ton. The appearances are that the ledge is gradually widening, and that as depth is attained the character of the ore is growing better.

LADY WASHINGTON.—The main drift at the 850-ft level to cross cut the ledge at that point is now in 90 feet. The face is in softer material than last week, and is evidently getting pretty close to the ledge. There is a continued seepage of water coming in, but nothing to interfere with the work.

NEW YORK.—The enlargement of the shaft is steadily progressing. A full force of men are employed and the work being pushed with great vigor. Cutting out for the pump stations has also commenced.

SUPERIOR.—The tunnel being run from the ravine to drain the water in the shaft is advancing at a very satisfactory rate, and the water will be tapped soon. When this is done the hoisting works will be again started into operation and the ledge ont in a few days.

YELLOW JACKET.—The east cross-cut, 100 feet south of cross-cut No. 1, at the 2040-ft level, is in 205 feet; face in porphyry and quartz of good quality. The new or east shaft is down 47 feet, and well timbered to that depth.

MEXICAN.—The west drift on the 1465-ft level, following the line of the diamond drill hole, is steadily advancing. Yesterday morning this drift struck quartz with some ore, and it looks to-day as if a paying body of ore might be encountered at any time.

SAVAGE.—The pumps have been kept steadily running at their full capacities during the week, and are steadily though slowly gaining on the flow of water. The water during the first portion of the week showed a strong increase in the main shaft, but is to-day again rapidly on the decrease.

WEST JUSTICE.—The erection of the necessary hoisting works building, to protect the miners during the inclemency of the coming winter, is going rapidly ahead.

SIERRA NEVADA.—The flow of water at the bottom of the shaft is still quite strong, but affords no impediment to the working of the 1700-ft level. The prospecting drifts both north and south on the third station level are showing a decided and very encouraging improvement.

OPHIR.—Owing to a stoppage of the Mexican mill for repairs and to give time for the opening of some new portions of the ore body, caved by the flooding of the mine a year ago, the daily yield of ore has been greatly lessened during the past week. The ore stopes on the 1600 and 1650 ft levels continue to yield well and furnish a good quantity of ore.

CROLLAR-POTOSI.—Daily yield, 100 tons of ore, from the old stopes in upper portions of the mine. The average assay value of the ore is about $30 per ton.

MINT.—Sinking the shaft is making splendid progress, the bottom being in excellent working ground. The shaft is now down 1,296 feet.

BEST & BELCHER.—Owing to the flooding of the main drift on the 1700-ft level, no cross-cutting is being done in the mine at present. The water is now entirely drained, but there is still some repairing of the drifts to be done before prospecting is again commenced.

GOULD & CURRY.—The erection of the new pumping machinery is going steadily forward. The repairs to the lower portion of the main shaft and incline are also steadily progressing.

TEOJAN.—The north and south drifts on the 300-ft level are each steadily advancing, with increasing ore prospects. The north is looking especially well. The upraise on the ore body 70 feet north of the shaft is also showing a great improvement

PHIL. SHERIDAN.—Sinking the shaft is making excellent progress. The bottom is still in a very favorable character of ledge material.

SUCCOR.—The erection of the new pumping machinery is making steady headway. The hoisting engine is completed and in good running order.

WARD.—The small pump for draining the water at the bottom of the shaft is in place, and is working admirably.

DAYTON.—The cross-cuts on the 500-ft level are still looking favorable for good ore developments ahead.

AUREOLA & ARGENTINA.—New shaft down 95 feet. Bottom in much harder rock than last week. Good streaks and bunches of very good looking quartz are met with.

HALE & NORCROSS.—The pumps are working finely, and are kept running up to their fullest capacities. The water has been lowered in the main incline during the past week at the rate of five feet per day.

PROSPECT.—Good streaks of quartz, some of which assay well, indicate a near approach to the ledge by the main drift west at the 400-ft level.

BUCKEYE.—The north drift on the 550-ft level has been again started up. The face of this drift is in quartz and ore of a fair quality.

SOUTH COMSTOCK.—The main drift east from the 300-ft station is now in 35 feet. The rock is very hard, but shows of good progress.

LEVIATHAN.—North drift at the 600-ft level, following the west wall of the ore vein, progressing well, with indications in the shape of feeders of ore, which assay very well.

COSMOPOLITAN.—North and south drifts from the winze below the main adit level is in excellent ore.

WEST BELCHER.—The various ore openings at the 300-ft level and above are showing finely.

SUTRO TUNNEL.—Total length, 14,948 feet. Face of header in very fair working material, principally porphyry, with streaks of quartz and clay.

NORTH CARSON.—The 450-ft level is being opened in good shape, and the heavy feeders of good ore met with are very encouraging.

SOUTH OPHIR.—The ore streak in the main ledge shows wider and better as further drifted into.

JUSTICE.—The mine continues to show richly on all the ore-producing levels. Daily yield, 225 tons of ore. The ore body on the 400-ft level continues to improve both going and in the winze now being sunk to connect with the upraise from the 700 ft level. This upraise is also in ore of a very fine character. The main south drift is steadily advancing, the face still in good ore. The east cross-cut from the northeast drift on the 1000-ft level is rapidly advancing, the face in quartz and porphyry of a very favorable description.

SILVER HILL.—The ore shute on the 800-ft level is completed and work has been resumed in the face of the east drift on that level. Sinking the main incline was delayed somewhat during the week by the loosening of one of the fly wheels on the main shaft of the pumping engine. This trouble, however, has been overcome and the sinking resumed.

OVERMAN.—Sinking the main shaft is making fair progress, the bottom in good working ground. The erection of the new pumping machinery is making steady headway.

BELCHER.—Sinking the main incline is going ahead rapidly. Sinking the air and drain shaft is also making good progress. The water gives no trouble. Daily yield, 250 tons of ore. The ore is taken from the old upper workings, and is just enough to keep the mills steadily running.

AMAZON & HASSOCK.—Sinking the main shaft is going ahead rapidly, the full size of the shaft being in ledge material of the most favorable kind.

NORTH CON. VIRGINIA.—Sinking the main shaft is making rapid progress, the bottom being in soft ledge material of a very favorable description. The shaft is evidently approaching the main vein.

TAHOE.—Sinking the main shaft has been suspended in order to erect better hoisting works and steam machinery.

ROSSUTR.—The prospecting drifts on the 500-ft level are looking more and more favorable for the finding of a large body of paying ore.

EAST JUSTICE.—Sinking the main shaft is going rapidly forward. This is a new mine and a splendid location, and the managers are going to work with a will to prove its worth.

BALTIMORE AND AMERICAN FLAT.—The ore development in the east cross-cut from the north drift on the 1050-ft level is showing finely.

CALEDONIA.—Sinking the main shaft is making fair

Continued on Page 324.

The Gold Mines of Plumas County.

From the letter of a correspondent of the *Bulletin*, we extract the following concerning the mines of Plumas county: The mining now going on in Plumas county is vastly different from that of 20 years ago. But not a tithe, or possibly hundredth part of the auriferous treasure natnre has stowed away in the mountain recesses of this section has yet been taken from the bowels of the earth. But it is still only gold that is mined. Placer mining virtually exists no longer. There now takes its place gravel mining and quartz working. The gold within a short distance of the surface was taken ont in a few years, and placer mining, as the all-absorbing occupation, has, speaking generally, become extinct. But the California mining of the future—gravel mining in its various ramifications—will perhaps be prosecuted with more energy in the Centennial of 1976 than in the Centennial year we are now passing through. While the early mining era was transient, the future will be permanent. Another difference is that while the appliances for placer mining were simple and inexpensive, no person can profitably engage in gravel mining who has not at the commencement of his operations control of almost unlimited capital. But while a large sum of money is necessary, the returns under judicious management are ample—greater in proportion than the gains that as a rule accrued from the ruder mining operations of early days. Tunnels have been run into the mountain side for a thousand or two feet. Water, although abundant, has to be brought perhaps for twenty and in some cases thirty miles to insure a sufficient head. Steam engines have to be erected to pump off the surplus water. And when it is stated that every inch of pipe, or other article used, has to be teamed for at least 70 miles over rough mountain roads, and afterwards, perhaps, packed five or six miles down a steep mountain trail, it will be easily understood that the investment of a large amount of capital is necessary before the mining operations of to-day can be successfully prosecuted. But when the opportunities for investments of this character are better known and appreciated, capital will find its way here.

The Ancient River Channels.

Gravel mining consists of extracting from ancient river beds or benches the gold contained therein. As a rule the gold is found in small particles, equally distributed throughout the bed or channel of the ancient water course. These channels were the beds of rivers which existed aons of ages ago in the geologic era, when the topography of California was totally unlike that at the present time. These ancient river channels have been evidently covered over by a volcanic or other great upheaval, probably the former, from the lava and scoriæ, which are frequently found wrapping them up. There is one peculiarity about these ancient subterranean channels—they almost invariably run in a contrary direction to the existing rivers. They are as equally tortuous in their sinuosities and windings as the rivers of to-day. They are discovered by what is called the "rim" rock, which crops out on the surface, but it takes an intelligent miner to designate where the ground shall be opened or a tunnel run in order to strike the channel. It is here that our present knowledge is superficial. Undoubtedly the day will come when this branch of mineralogical geology will have sufficiently advanced that the expert will be able to strike the ancient channel from the rim rock with the same accuracy as the surveyor now strikes out metes and bounds. But the channel, once discovered, is often so well marked that a novice in mining has no difficulty in distinguishing it. There are boulders, gravel and sand as in the rivers of to-day. And I have seen in the channels of several gravel mines in this county large boulders weighing many tons washed as smoothly as only the attrition of thousands of years could produce. The apothegm "waters wear the stones" is equally true of by-gone ages as of the current time. The fact that these gravel mines are ancient river beds makes them permanent and beyond forming anything like an accurate estimate of their actual value.

A Channel Once Found

May be followed for three or four miles, or an indefinite distance, until some ravine or canyon intervenes. Even when lost by any volcanic or other disturbances of like character, if the course of the river has been watched closely, an expert will be able to make a good calculation where in all probability the channel may be struck again. So it is possible that in the future we may know the length and general direction of the ancient rivers of the State, and from the information thus acquired may arrive at a measurably accurate perception of the pre-historic geography of the country. What makes these ancient river beds so valuable, is the fact that they have been discovered varying from 70 to 300 feet wide. At Dutch Flat, in Placer county, one of these ancient channels has been traced as accurately for a length of five miles as the present bed of the Sacramento river. One other circumstance is also worthy of note—river channels have been found almost everywhere, where placer gold was discovered in early days. It is so in Nevada, Placer and Butte counties, and also in Plumas. Since we have hardly commenced gravel mining, but few of these ancient beds have been traced. That they are as numerous as the creeks, streams and rivers of to-day is only reasonable. But whether the channel is that of the small creek or some gigantic rolling river, they all contain more or less gold. As before stated, the gold is found in small particles, embedded in sand, and requires skill and labor to obtain it. But it is evenly distributed throughout the channels, and, as far as I can ascertain, no auriferous river channel has been discovered where the precious metal has petered out, so long as the channel continued well defined. Hence a gravel mine is one of the most valuable of all mining properties. It is permanent, and the returns for the outlay of money and labor are more certain than other enterprises of this character. The richest gravel is found within six feet of the bedrock, which is generally of a slate or granite formation.

Gravel Mines of Plumas County.

Perhaps the most important gravel mines in this section of Plumas county are those located around Dutch Hill, about 20 miles from Greenville. There are several of this class of mines in that neighborhood, representing all the departments of gravel mining. At Dutch Hill itself, more or less placer mining has been done since 1854 or 1855. The North Fork mining company of San Francisco recently bought out several small claims which were located here, and now own the whole ground, conducting the business on an extensive scale. This company runs a hydraulic apparatus, drift diggings and ground sluices. Since the North Fork company has been in possession of the property, two or three years, all the modern appliances for mining have been brought by ditch and pipe a distance of 34 miles. The piping, 22 inches in diameter, runs for nine miles, and is, I am informed, the longest line of pipe in the State. Of course, bringing water such a distance involved a large outlay, nearly $100,000. But the company had faith in the richness of the ground, which when properly worked paid from the start. To obtain this supply of water considerable tunneling was necessary. There are two tunnels of great length, one 835 feet long and the other 1,000. The company has scarcely commenced washing away the sides of the hills and mountains where gold is known to exist, but where the little giant has been brought to bear satisfactory results have been obtained. Here it may not be out of place to state that until a person has had ocular demonstration of the force of water used when hydranlicing, it can hardly be comprehended. It is impossible to thrust a crowbar into the stream as it issues from the giant. The bar flies back and is quickly knocked out of the hand of the person holding it. An attempt to drop a boulder weighing perhaps 100 pounds through the stream only results in said boulder being thrown about 100 feet away. Any softer substance, as the body of a man or horse, coming in contact with the stream as it issues from the nozzle of the pipe, would be instantly cut in two. And the way it just rips things is wonderful to behold. Sides of mountains tumble down when the water is brought to bear, as if by magic. In fact, it would almost appear as if the hydraulic little giant was the faith spoken of in the Scriptures, which could remove mountains.

The North Fork Company

Has also at Dutch Hill drift diggings, drifting into the side of a mountain for finding and following the channel of an ancient river bed. The company has already done about a mile of tunneling, striking a well defined channel, which they are following at perhaps five or six feet a day, and the results of the washings of the gravel are surprising. The company is somewhat reticent as to the gold actually obtained, but from the clean-up made while your correspondent was visiting the mine, the channel must be very rich.

This company has likewise a claim which they ground-sluice—that is, loosen the earth, boulders and gravel from the bedrock, start a pipe of water to wash down the debris, and then pick the gold out from the crevices in the rock, washing the loose gravel in the ordinary way. One day last week, while watching such an operation, I saw one of the company's employees pick up a nugget weighing the weight of $110. If this can be done daily, why Dutch Hill is a veritable El Dorado.

The Sunnyside Company,

Also a San Francisco corporation, is at work about three and a half miles south of Dutch Hill, nearly at the base of a mountain sloping down to the north fork of the Feather river. This mountain is similiar in shape to a hog's back, and on each side there is a steep ravine. The top of the mountain is cased with lava. This property was only purchased from the original locators in the fall of last year, and the company has only recently been incorporated. It was believed, when purchased, that the lava of this mountain capped an ancient river channel. A tunnel has been run in a distance of 600 feet, and a well defined channel, about 200 feet wide in the bottom, discovered. The course of this channel has been traced by the rim rock for about two miles, but how much further it extends is at present unknown. The owners regard the indications as highly satisfactory. The channel is very clearly defined in the tunnels already made, and the cars, (containing each about half a ton of gravel,) washed in the presence of your correspondent, yielding an average of $4.40 per car. The gravel here is peculiar, carrying a great deal of jasper and fine ferruginous black sand. The gold is regular channel, not lead gold, and the gravel is equally rich six feet from the bottom as on the bedrock. The company is so satisfied with the prospecting its employees have done, that arrangements are in progress for running a drift across the channel, so that 50 men can be employed in the profitable occupation of taking out gravel. When this work is completed, if the gravel pays as now, and in their ancient river beds the gold is extremely regular, each of the 50 men employed will be turning out $20 per day. It requires but little calculation to estimate the daily out-put from a mine of this character.

The Cariboo Company

Have gravel diggings about eight miles from Dutch Hill. The company has what is considered one of the most magnificent water-powers in the State—2,000 miners' inches, under a five-inch pressure. The water is brought partly by flume and partly by ditch from Butte creek, a distance of five or six miles. The water thus applicable for the company's claim is more than sufficient to supply San Francisco. The construction of this flume must have cost a large sum of money, as portions of it are constructed on trestle-work on a mountain 1,500 feet high. The scenery on the road to the Cariboo mine is singularly beautiful. The view from one place is almost precisely the counterpart of Cape Horn on the line of the Central Pacific. The spectator looks down an abyss of about 1,500 feet, and sees the Feather river glistening like a thread of silver meandering in the distance.

Another claim, where there is opportunity for

Hydraulicing Drift Diggings

And ground sluicing, is at Providence Hill, about 12 miles west of Greenville. The company owning it takes its name from the location. This claim is comparatively undeveloped. The company is preparing for active operations the coming spring. It has a water privilege on Rush creek and has built a dam in Long valley 750 wide and 40 deep. The water in the reservoir thus formed is carried to the claim by two ditches, one three and a half miles long and the other one mile less in length. The company intend hydranlicing on a large scale early in the ensuing season. Gravel mining is also extensively followed in the country surrounding Taylorsville, Laporte and at Light's canyon. There are indications of extinct river channels at other places, but as nothing can be carried on in working claims of this character except at great expense, but little has been done toward their development. Capital will, however, ere long find out that gravel mining is one of the most remunerative of mining enterprises, and then we shall know something further concerning the extinct river channels of Plumas county and their auriferous deposits. It may be well here to remark that not one of the mines in Plumas county is sold on California street. The stock is generally held in a few hands, and the mines run as a legitimate investment, and not for stock speculation.

The mining enterprises in Plumas county are by no means confined to operations in gravel.

Gold Quartz Mining

Is carried on extensively. All through the mountain ranges quartz is found containing more or less of the precious metal. And Plumas county possesses this advantage: having such an abundant water supply low grade quartz can be milled with profit, which elsewhere would not pay for the milling. Several mills pay on ore yielding but $6 to the ton. Even in those where gravel mining is the principal feature, quartz is occasionally seen in large quantities. One of the principal quartz mines in the county is called the Eureka. It runs 40 stamps, and is situated near Quincy, the county seat. This mine is the property of the Bank of California, and was purchased some three years ago, as I am informed, by that institution, for $1,000,000. The Green Mountain mine, running 32 stamps, and the Gold Stripe, running 28, are both near Greenville. These are under the superintendence of W. Bidwell, a nephew of Gen. Bidwell, of Chico. Other quartz mines are the Great Western Mining, 40 stamps; the Union, 24; the Crescent, 32; and the Buchanan, 8. Then there are the New York mills and the Cherokee, the capacity of which I am unable to ascertain. The last remnants of placer mining in the county are going on at Wolf creek.

Homes of the Miners.

It must be conceded that the miner in the mountain is not surrounded by all the luxuries and elegancies of civilized life. He has hard work to perform, and his occupation is particularly exposed to danger—accident resulting in loss of life or limb. But still, as a class, miners are more contented and happy than men in a similar sphere of life in large cities. But few are married, and of those in the conjugal state, not many have their wives and families with them in the mountains. Mine owners and superintendents frequently prefer married men, because they work more regularly and are more reliable. Women are a scarce commodity in those mountainous districts—few and far between. But the few that are here ought to be happy, for no heathen deity ever received more attention than the ladies in the mountains of California. The married men, having their families with them, engaged in the larger mines, occupy separate cabins, while those unmarried room about four together, in cabins by themselves. The cabin of the married miner is easily distinguishable from that of his single co-workman. The trim white curtain denotes that the helpmeet to man is found therein, and the few flowers in the window show that even in the mountains woman realizes and understands what is meant by home attractions. The cabin of the unmarried miner is devoid of attraction. Nothing, as a rule, is found therein, save rudely-constructed bunks, where the miner covers himself up in his blankets, and enjoys that blissful repose generated by hard work and pure mountain air. The cabins are built of pine wood, often the merest shanties, offering no pretentious adornment, and consisting of little else than pine logs nailed together as a protection from the elements. The cabin of the superintendent is generally a little more ornate, and is, perhaps, painted on the outside and papered in the interior. But utility more than ornament is the prevailing idea in the construction of these habitations. Some companies are more on improvements than others. The Dutch Hill, for instance, provides accommodations which, but for their exterior, are equal to many dwellings of the industrial classes in San Francisco. Room and comfort prevail all over their claims, even to the out-houses and barns.

Wages, Food, Etc.

Miners' wages in the mountains average $3 per day, working six days a week, of which $1 is deducted for board. In many of the mines wages are calculated monthly, $50 being the prevailing figure, with the run of the boarding-house. And a miners' boarding-house is a great institution. The style of living is equal almost to any hotel in the State. Three meals a day and plenty on the table is the characteristic of a miners' boarding-house. No matter how mean the cabin, how remote the location or how difficult to transport, supplies, there is always a good table. Happening to drop in one five miles down a steep mountain trail at dinner time, I found the hardy sons of toil regaling themselves with oyster stew as a first course. Then came joints, good substantial beef and mutton, finishing with apple pie and grapes as dessert. Hot biscuit are served at every meal, and the rapidity with which they disappear would astonish the city-bred individual. I heard of one man who makes it a regular practice to put away 13 biscuits every meal. But the men work hard, the mountain air sharpens the appetite, the companies are sometimes rich and there is every reason why a miner's inner man should be well sustained. There is a room for doubt, however, whether the mine owners are not out and injured in charging only $6 for seven days' board. There is one character about a miners' boarding house who is a perfect institution. He is the Chinese cook, who, as purveyor for that important part of the human cosmogony, the stomach, is an important personage at these establishments. The miners understand what good cooking is, and will not tolerate any slouch around. And the way John Chinaman sends his dishes to the table would be no discredit to the *chef de cuisine* of the Palace hotel. In all the mining boarding-houses where it was my lot to take a meal, there was the same skill manifested in the culinary department. And tha way in which these Celestial cooks manufacture hot biscuits and bread and manipulate the ingredients into an apple pie is something surprising.

At all the large mines there is a store where the workmen can obtain such furnishing goods as they require at moderate rates—about cost price, with the cost of transportation to the mountains added. Gambling is still the great vice of the miners in the mountains. At many of the larger enterprises card-playing is prohibited, because it leads to quarreling and often ends in a shooting scrape. At most of the large mines the sale of whisky is prohibited. The consequence is that in the mountains the miners are as temperate a set of men as is to be found in the world. Taken as a class they still bear out the same reputation for intelligence as they obtained in '49. *Harper's Weekly*, the monthly magazines and all the San Francisco and Sacramento dailies and weeklies find attentive readers in the miner's cabin. Many are exemplary in their demeanor, and not a few have bank accounts or shares in mines running away into the thousands of dollars. The great object with many seems to be to stay a few years in the mountains to make a sufficient raise to leave this semi-desolate life and spend the remainder of their days in comfortable circumstances in the city.

THE MAMMOTH GUN.—The trial of the 100-ton Armstrong gun, made for the Italian government, was eminently successful. A ball fired with 341 pounds of powder attained the velocity of 1,500 feet per second, smashed solid wrought iron plates 22 inches thick, and completely pierced the strong backing of 30-inch backing of the target, the resistance of which is supposed to equal the sides of the great Italian iron-clad Diulis, and had velocity enough remaining to have smashed the other side of the ship, and would have carried complete ruin into her interior. An equal charge completely demolished the soft steel plates of Schneider's manufacture, but did not penetrate the backing, though it is stated the shock would have so shaken the structure of a vessel like the Diulis as to cause a leak.

LEAD POISONING.—We notice in an exchange that a celebrated French chemist recommends that workmen subject to lead poisoning should take daily very small doses of iodide of potassium. He affirms that this substance will dissolve the lead absorbed by the human system and effect its rapid removal from the body.

Siskiyou and Humboldt County Mines.

A correspondent of the Lake County *Bee* writes from Sawyer Bar as follows: On the 10th day of last August, the finishing touches were placed upon the disorganization of old Klamath county by the completion of the report of the commissioners appointed for that purpose. The name was blotted from the roll as a county; but the memories which cling round the dear old county will remain and be cherished as a precious treasure of the golden past.

The division of this territory between the counties of Siskiyou and Humboldt was as equitable as its geographical diversity would permit; giving the eastern portion, with its wealth of undeveloped quartz field—including the celebrated Black Bear mine, already open and paying large dividends—to Siskiyou, and the whole western slope, fringed by the waters of the Pacific, and cut by the mighty Klamath river, to Humboldt. This portion contains the finest belt of timber in the world, stretching from Mad river on the south to the Klamath river on the north, 60 miles in length, and 20 miles in width; principally redwoods. If a break-water could be created at Trinidad it would form the outlet for this immense field of timber, and would be one of the most profitable ventures in which capital could engage. Besides this, there fell also to Humboldt a rich and

Gold Bearing Gravel Deposit,

Which in extent is one of the marked features of the country. This deposit is found at Happy Camp and extends from there to Gold Bluffs on the coast, where its feet are washed by the Pacific and its riches spread out on the sands, there to be gathered by the beach miners. It lies at an elevation above the river of 100 feet, and is continuous, save where the river has cut its sinuous course through this ancient deposit. J. M. Brown was the first one to develop it at Orleans Bar, and is now negotiating with parties in San Francisco. Should this sale be effected it will lead to great results on the river. Numbers of claims can be opened above and below this point which will be equally rich. Mr. Sutherland has the same deposit at Big Bar, eight miles below Orleans Bar, and is making every improvement he can for the utmost displacement of gravel. This belt, as I have before said, can be traced for miles by its general appearance, and the croppings of the decomposed slate upon which it rests. If a scientific investigation could be had of this interesting region, the most wonderful developments, I am sure, would follow. Capital will be timid until it is thoroughly explored.

Our Mines

Are principally quartz. The Black Bear mine is the most profitable, and is worked in the most scientific manner. The company has built a boiler outside the mine, and conduct the steam in pipes 1,200 feet to the engine, and steam pumps in the bottoms of the lower levels. The shaft is down 260 feet, and paying better the farther they descend. The Yellow Jacket, belonging to the same company, and worked through the same tunnel, is opening finely upon a large body of ore. This mine has always paid well; but the chief characteristic is the quartz is found in bunches. As the company descends upon the ledge, the mine is less broken and the bunches are larger. It is deduced from this that in 100 feet more descent the ledge will be continuous and the wall unbroken.

The Klamath Quartz Mine

Is being opened by Mr. John Daggett. This company has heretofore done too much dead work to be profitable; but they were ambitious of a full development at an early period, and were lavish of their means. This is one of the best appointed mines in the State, and can be worked very economically.

The Evening Star

Is paying well. This is a four stamp mill and has proved an excellent investment since it started. That it does not pay better is for the reason that it has no more stamps. The ledge is 12 feet thick.

The Morning Star

Is beginning to show signs of the life to come. It is under the able management of H. W. George, a skillful miner, and one whose prudence and economy has earned for him an enviable reputation.

Working Ash.—The *Lumberman* says: Steam is the ordinary means used to soften ash, but when is practicable, boiling in water is the best. The chief thing is to have the right kind of ash, as some kinds bend and others do not. One tract of land may furnish the best of ash, while another, lying close by and having just as good a soil, may produce only an inferior quality. The timber must be heavy and tough, and cut from good trunks. No matter if it has been cut and dried three years, A splinter of this quality of ash can scarcely be torn off, and runs the whole length of the wood before it ceases. Half an hour's boiling is sufficient to soften a piece of wood six centimeters thick. When the wood is taken out of the kettle, put it in the brace, screw and wedge it in the desired form without relaxing, and let it cool a few hours. After the wood is thoroughly dried in the brace, unscrew it and take out the wedges; it will always then retain its form.

Useful Information.

India Rubber.

While nations have been agitating themselves with affairs in the East, and fears of change and other like dangerous and distracting matters, a wiser man, says the London *Standard*, has been devoting himself to the study of the great india rubber question in the forests of Darien. The world could get on very well without Eastern questions, but could not manage at all without india rubber, and there has been reason to believe that the native way of supplying the commodity is wasteful, and would in the end be destructive. Indeed, our explorer has found it the custom to cut down big trees, varying from 150 to 200 feet in hight, for the sake of an amount of rubber varying from 100 to 150 pounds. He has also found what are the climatic conditions best suited for the growth of the tree; and to these and similar explorations, the Kew authorities have just given a practical turn, for a shipment of 38 cases of Brazilian india rubber plants, containing over 1,900 plants, has recently been dispatched from Kew to Ceylon, and, it is worth mention, within the remarkably short space of two months from the time of the seeds being sown, this tree yields the finest kind of caoutchouc, or "india rubber" with which we are acquainted, imported from Para, in Brazil. The Royal gardens have for some time past been occupied in its cultivation for introduction to those countries where it may be expected to become a rubber-producing tree. In June of this year 70,000 seeds were received, of which only about three and three quarter per cent. were alive. In consequence of their retaining vitality but for a very short period, they were all sown the day after arrival, and, though not contained in pans, covered a space of over 300 square feet, closely packed together. A number began to grow almost immediately, and many within a few days reached a hight of 18 inches. So quickly do they grow that the cases had to be made from special measurements, allowing for growth during transit. Each case contains, as a rule, 50 plants. Besides these to Ceylon, other cases have been sent to Singapore and Burmah, and still others are in hand for various destinations. Altogether it is likely that about 2,600 plants will be distributed from this batch of seeds. This is good work, and we may reasonably hope for it the same success that has been attained in the case of our cinchona plantations.

Notes on Furniture Cleaning.

Furniture Cream.—1. Yellow wax, 4 ozs.; yellow soap, 2 ozs.; water, 50 ozs.; boil, with constant stirring, and add boiled oil and oil of turpentine, each 5 ozs. 2. Soft water, 1 gallon; soap, 4 ozs.; white wax, in shavings, 1 lb. Boil together and add 2 ozs. of pearlash. To be diluted with water, laid on with a paint brush, and polished off with a hard brush or cloth. 3. Wax, 3 ozs.; pearlash, 2 ozs.; water, 6 ozs. Heat together and add 4 ozs. of boiled oil and 5 ozs. of spirits of turpentine.

White Furniture Cream.—Raw linseed oil, 6 ozs.; white wine vinegar, 3 ozs.; methylated spirit, 3 ozs.; butter of antimony, ½ oz.; mix the linseed oil with the vinegar by degrees, and shake well so as to prevent separation; add the spirit and antimony and mix thoroughly.

Cleaning and Polishing Mahogany.—Take 1 pint of the furniture oil, mix it with ½ pint of spirits of turpentine and ½ pint of vinegar; wet a woolen rag with the liquid and rub the wood the way of the grain, then polish with a piece of flannel and soft cloth.

To Renovate Wicker Tables.—Paint them over with Brunswick black; it is used for work and fancy baskets, is not expensive, and can be procured at the grocer's.

Removing Varnish from Wood.—A strong application of ordinary spirits of camphor will remove almost any kind of polish or varnish. Give the spirit time to evaporate before repolishing, or it will injure the new polish. Another.—The plan I adopt to remove varnish from wood is to make a strong solution of soda, soap and water, and keep the place constantly wet while I go on scraping. This softens the varnish, and I afterwards rub down with paper previous to revarnishing.

Danger of Fire from Steam Pipes.—The fact is generally admitted by those who have given the subject careful attention that steam pipes in connection with wood are dangerous; not because the heat of saturated steam is capable of directly exciting combustion, but because the conditions under which wood, so placed, is liable to ignite, may be produced by the continued high temperature to which it is exposed. The marine inspection law of the United States recognizes this danger when it prohibits the use of steam pipes in conjunction with wood upon vessels. Just what these conditions are, and the peculiar combination of circumstances under which they are most readily developed, are not now known, so that until they have been determined by a careful and exhaustive investigation of the whole subject—which task, we trust, some able scientist will soon undertake—it is by far the wisest plan to avoid all possibility of inducing a conflagration by taking the precaution to ascertain that heat-conveying pipes at no point come in contact with inflammable material. — *Northwestern Lumberman.*

Heating Power of Different Fuels.

Although frequent attempts have been made to render the use of fuel as advantageous as possible, the results are far from satisfactory, as only part of the heating power is utilized. The difference between theoretical and effective heating power for various sorts of fuel is shown in the *Technologist* by the following table, which gives the number of pounds of water evaporated by one pound of fuel:

Fuel.	Heating Power. Theoretical.	Stm. Boilers.	Open Boilers.
Petroleum	16.30	10 —14	.....
Anthracite	12.46	.....	.....
Coal	11.51	5.2 —8	5.2
Charcoal	10.77	6 —6.75	3.7
Coke	9—10.8	5 —8	.....
Brown coal	7.7	2.2 —5.5	1.5 —2.3
Peat	5.5—7.4	2.5 —5	1.7 —2.3
Wood	4.3—5.6	2.5 —3.75	1.85—2.1
Straw	3.0	1.86—1.92	.....

As regards the heating of steam boilers, Mr. Thompson found, by a series of experiments, that, on an average, only 47 per cent. of the theoretical heating power of the fuel is utilized, the remainder being lost through imperfect combustion, radiation and other causes. Since portable engines have been arranged for straw burning, this fuel has become of great importance for agricultural purposes. Trials at the Vienna exhibition proved that one pound of straw is capable of evaporating from 1.81 pounds to 1 97 pounds of water into steam of 70 pounds pressure and 305.6 deg. Fah.

Fireman's Dress. — An improved dress, designed to enable firemen to enter a burning building in safety, has been recently made the subject of some interesting experiments. It consists of two air-tight garments, worn one over the other, after the manner of a diver's dress. The inner dress is of rubber and fits tightly; the outer dress, worn over this, is of leather and is quite loose. The outer suit is also secured to a metallic helmet resting on the shoulders and entirely covering the head. A line of hose is attached to the back of the outer dress, where it divides into two smaller pipes. One goes to the top of the helmet on the outside, where it discharges a number of fine streams of water that flow down over the outside of the dress. The other branch pipe passes under the fireman's arm, and ends in a nozzle that he may use in directing the stream on the flames. Within this hose is another, smaller, that delivers air under pressure to the open space between the two garments. The air expands the outer garment and keeps it away from the person, and at the same time supplies fresh air for respiration. To allow for the escape of spent air, two small holes are drilled in the helmet opposite the eyes, and through these the exhausted air escapes, driving the smoke and flames away from the face and giving a clear view without injury to the eyes. Such a dress enables a fireman to stay within a burning building for 20 minutes in perfect safety.—*Scribner's Monthly.*

Direct Manufacture of Soap With Salt.—If grease, fat, or resin, which are commonly employed to make soap, are heated with an excess of common salt, ammonia, and water, a soda soap separates, leaving chloride of ammonia in the liquor, together with the excess of ammonia and salt. This reaction is the consequence of the great solubility of ammonia soap in ammoniacal water, and the insolubility of soda soap in water containing more than one-half per cent. of salt. The ammonia at first unites with fatty acids; then the sodium in the salt exchanges places with the ammonia in the soap, forming, as we said, a soda soap and chloride of ammonia. It is essential that there be an excess of ammonia and salt present in order that the reaction take place. One hundred parts of grease require 15 to 20 parts ammonia, 20 to 30 parts salt, and 200 to 300 of water.

Good Health.

Prize in Industrial Hygiene.—Our English exchanges tell that an offer of a medal in connection with this subject has been made by Mr. Benjamin Shaw, and has been gratefully accepted by the Society of Arts. The medal will be of the value of £20, and will be awarded every fifth year. Mr. Shaw has transferred into the name of the society a sufficient amount of Consols for the purpose. The terms of the offer are as follows: "For any discovery, invention, or newly-devised method for obviating or materially diminishing any risk to life, limb, or health, incidental to any industrial occupation, and not previously capable of being so obviated or diminished by any known and practically available means." The first award will be made in May, 1877. Parties desiring to compete for the above prize should communicate with the secretary of the Society of Arts. A full description of the invention or process must be given—illustrated, if necessary, by models, drawings, specimens, etc. When the invention or process is in actual work, it is desirable that this should be stated, so that the committee may, if they think proper, have the opportunity of examining it. The council reserve to themselves the right of withholding the prize, in the event of nothing of sufficient merit being sent in for competition. The latest date for receiving communications will be March 31st, 1877. In case a sufficient number of objects are sent in for competition, the council will make arrangements to exhibit them or a selection from them to the public.

Enameled Cooking Vessels.

Mr. Robert R. Tatlock, of Glasgow, has lately presented some facts of interest in the *Chemical News* upon the above named topic. He affirms that in some instances the milk-white porcelainous enamel, with which cast iron cooking vessels are so commonly prepared, is of such a character as to be objectionable in the highest degree on account of the easy action upon it of acid fruits, common salt, and other ordinary dietetic substances, by means of which lead and even arsenic are dissolved out in large quantity during cooking operations. He gives analyses of three enamels, the samples being taken from three cast iron pots made by different makers, in each of which lead or arsenic (and in two of them, both of these substances) were found, the percentags of lead being in one case as high as 25.8; and that of arsenic, 1.02.

The author believes that it is not so much on account of the presence of large proportions of lead and arsenic that the enamels are so objectionable, but because they are so highly basic in their character that they are readily acted upon by feebly acid solutions, the lead and arsenic being thereby easily dissolved out. In support of this opinion he adduces the fact that of the three enamels which he examined, a one per cent. solution of citric acid almost instantly roughened and destroyed the glossy surface of that which was the most basic in character, and lead dissolved out to such an extent as to give immediately a dense black precipitate with sulphureted hydrogen, while the one samples in which the ratio of the bases to silica was smaller, were less decidedly affected.

He thought that no enamel should be admitted to use unless it was totally unaffected by boiling with a one per cent. solution of citric acid, which was a very moderate test, and gave it as his opinion that either the use of such poisonous ingredients as lead and arsenic in large quantity should be entirely discontinued, or that the composition otherwise should be of such a character as to ensure that none of the poisonous substances could be dissolved out in the circumstances under which the vessels are used.

Measuring Medicines.

The *American Grocer* recently published an article stating the death of a child from an overdose of opium, which was contained in a prescription administered in "tea-spoonful" doses. Investigation showed that the family had used a large size teaspoon, and had thereby given three-sixteenths, instead of one-sixteenth of a certain preparation of opium. The writer in commenting on the case says: "The many accidents that formerly occurred in the putting up of medical prescriptions, led to the passage of a State law requiring every prescription clerk to pass a severe examination and requiring him to possess a diploma based on such examination. In this law, one of the most important safeguards seems to have been left out. As most of the liquid medicines are administered in doses of 'tea-spoonfuls,' the law should require the druggist to state plainly on the label what constitutes a 'tea-spoonful' in medical parlance."

We thank our cotemporary for the idea suggested, says the *Druggists' Circular*, and, while we do not think that legislation is exactly necessary to cover such cases, we believe that physicians should advise their patients more explicitly regarding the administration of their remedies. Especially in the case of children, medicines should be prescribed by drops, as the most reliable and efficient means of determining the exact dose.

The following designates the equivalent of miscellaneous measures: Tea-spoonful about one fluid drachm; dessert-spoonful about two fluid drachms; table-spoonful about four fluid drachms; wine glassful about two fluid ounces; tea-cupful about four fluid ounces; breakfast cupful about eight fluid ounces; tumblerful about eight fluid ounces; thimbleful about three-fourth fluid drachm; pinch (of leaves or flowers,) about one drachm, Troy; handful about ten drachms, Troy.

How Tall Are We?—A late number of the *Scientific American*, in discussing the question, "How tall are we?" publishes tables showing the mean hight of the men of 24 different nationalities. The result arrived at is that the Indians of the United States are the tallest, the mean hight being 67.934 inches. The whites of the United States come second, the mean of 315,620 examinations being 67.672 inches. Then follow the Norwegians, Scotch, inhabitants of British America, Swedes, Irish, Danes, etc. The English come eleventh in the list, being 66.577, followed by the Germans, who show a mean of 66.536. The French stand eighteenth in the list, at 66.277. The Spanish and Portuguese stand at the foot of the list, measuring 65.635 and 65.432 inches respectively. Comparing the natives of the different States of the Union, those of Kentucky stand at the head of the list, 68.677 inches. Kansas, Minnesota, Missouri, California, Nevada, Indiana and West Virginia follow, all exceeding 68 inches. The people of Illinois stand twelfth in the list, at 67.835 inches. Pennsylvanians stand eighteenth, 67.470 inches, while the Yankees of the wooden nutmeg State bring up the rear, being only 66.587 inches.

MINING AND SCIENTIFIC PRESS

W. B. EWER.....SENIOR EDITOR.

DEWEY & CO., Publishers.

A. T. DEWEY, W. B. EWER, GEO. H. STRONG JNO. L. BOONE

Office, No. 224 Sansome St., S. E. Corner of California St., San Francisco.

Subscription and Advertising Rates:

ADVERTISING RATES.—1 week.	1 month.	3 mos.	12 mos.
Per line.....	.25	.80	$2.00	$5.00
Half inch (1 square)...	$1.00	3.00	7.50	24.00

Four weeks are rated a month.

Large advertisements at favorable rates. Special or reading notices, legal advertisements, notices appearing in extraordinary type or in particular parts of the paper inserted at special rates.

SUBSCRIPTIONS payable in advance—For one year, $4; six months, $2.25; three months, $1.25. Remittances by Registered letters or P. O. orders at our risk

SAMPLE COPIES.—Occasionally we send copies of this paper to persons who we believe would be benefited by subscribing for it, or willing to assist us in extending its circulation. We call the attention of such to our prospectus and terms of subscription.

THE ORIGINAL ARTICLES in this paper are mostly set in solid type, giving in our columns one-third more reading than is contained in ordinary leaded matter.

ADDRESS all letters to the firm, and not to individual members, or others, who may at any time be absent from our office.

Our latest forms go to press on Thursday evening.

San Francisco:

Saturday Morning, Nov. 11, 1876.

TABLE OF CONTENTS.

GENERAL EDITORIALS.—The Victor Drill Chuck; Practical Workmanship; The Heating Power of Straw, 313. Miners and Farmers; Loss of Gold, Silver and Quicksilver; Mechanical Ore Concentration and Separation; The Problematical Intra-Mercurial Planet, 320. Items of Interest from the Mines; Remarks on Quicksilver; Pennsylvania Mountain Scenery; Mining Accidents, 321. Patents and Inventions; Notices of Recent Patents; Lixivlation, 324.

ILLUSTRATIONS.—The Victor Drill Chuck, 313. The Summit of the Alleghenies, 321.

CORRESPONDENCE.—Mines Around Virginia City, Montana, 314.

MECHANICAL PROGRESS.—Experiments with Temper in Steel; Russia Iron; Utilizing the Recoil of Guns; Boiler Making by Machinery; Wire Tramways; New Trans-Mediterranean Cable, 315.

SCIENTIFIC PROGRESS.—Meteorology; The Wilhelmshafen Iron Worm; Chemical Composition of the Brain; Prize; Acoustic Attractions; Air in Mines; Huxley's Visit, 315.

MINING STOCK MARKET.—Sales at the San Francisco, Pacific and California Stock Boards; Notices of Assessments; Meetings and Dividends; Review of the Stock Market for the Week, 316.

MINING SUMMARY from various counties in California, Nevada, Colorado, Idaho and Utah, 317-324.

USEFUL INFORMATION.—India Rubber; Notes on Furniture Cleaning; Danger of Fire from Steam Pipes; Heating Power of Different Fuels; Fireman's Dress; Direct Manufacture of Soap with Salt, 319.

GOOD HEALTH.—Prize in Industrial Hygiene; Enameled Cooking Vessels; Measuring Medicines; How Tall Are We, 319.

GENERAL NEWS.—General News Items and Miscellaneous Paragraphs, on 324 and other pages.

MISCELLANEOUS ARTICLES.—The New British Corvettes; "Pyrogen;" A Chinese Railroad; Floating Mining Stocks in New York; Prescriptions on the Wing, 314. The Gold Mines of Plumas County; The Mammoth Gun; Lead Poisoning, 318. Siskiyou and Humboldt County Mines; Working Ash, 319. South Almaden Quicksilver Mines; The Chance in Olive Oil; Antimony Mines, 322. Pacific Coast Railroad Items, 324.

NEW ADVERTISEMENTS.

Engines For Sale, O. B. Fenner, S. F.; Elastic Truss, Eccleston Truss Co., Marshall, Mich.

The Rainfall.

The importance of the rainfall warrants careful record of its area and amount. From all available sources we have compiled the following table, showing the precipitation at the places named for the season up to Nov. 1st:

PLACE.	COUNTY.	INCHES.
Martinez	Contra Costa	2.41
Vallejo	Solano	2.76
Colusa	Colusa	4.72
San Jose	Santa Clara	1.17
Napa	Napa	3.45
Santa Rosa	Sonoma	6.20
Stockton	San Joaquin	2.14
San Rafael	Marin	7 35
Nevada City	Nevada	10.46
Woodland	Yolo	3.54
Oakland	Alameda	4.99
San Francisco	San Francisco	3.76
Sacramento	Sacramento	3.01

DEATH OF A DISTINGUISHED SCIENTIST.—A dispatch from Stuttgart, Germany, records the death of Theodore Von Heuglin, who has gained considerable reputation as an explorer and zoologist. Deceased was a comparatively young man, having been born in March, 1824 Von Heuglin commenced those explorations which brought him prominently before the world in 1852, in the region of the White Nile. In 1863 he continued his travels in Africa, and in 1870-71 he was a member of Petermann's expedition on the shores of Spitzbergen and Nova Zembla. The deceased was likewise the author of several works on natural history.

THE Mexican Congress has declared President Lerdo re-elected. A number of insurgent bands have scattered.

Miners and Farmers.

The advance of time has, while changing everything else, changed in some degree the relations formerly existing between the farmers and miners of California. They used to be mutually dependent upon each other, so that consideration of interest was sufficient to prevent any rivalry beyond that incident to the advancement of their respective interests. Without miners, the farmers of California would have had but an indifferent market for their produce, and in the absence of the agricultural element, the necessaries of life could be attained only at advanced prices, impairing the welfare, not only the miners, but of all classes. Hence a community of interest created a community of feeling, and all strove alike to promote the prosperity of the State. To a great extent this is still the case, although in certain parts of the State an antagonism has been created between the two classes, occasioned by the differences of opinion on the question of "tailings" from the gravel mines.

An issue between two classes of the population is always to be regretted; and this instance is particularly so, since, as the question at present stands, it is likely to be an expensive and long continued contest, which will cause much bitterness of feeling, even among members of the respective classes not directly interested in the result. If the farmers make common cause against the miners, as seems likely, then the latter will without doubt help each other out.

Without, in this instance, attempting to review the merits of the question at all, we should remind both parties that there is no necessity of taking too extreme a view of the subject. Both parties have rights which the other must respect; and although in single instances some apparent injustice may be done in solving the problem, those before whom it will come for decision will doubtless exercise every care in settling the matter according to law and justice. Because there is a difference of opinion, each adhering to the view of the case inspired by his personal interest, there should not, on that account, be violent language used or feelings engendered difficult to reconcile in the end.

The farmers must not by any means think that the miners will quietly submit to their dictation on this question, close down their mines, give up their purchased rights and abandon their business. Nor must the miners run away with the idea that they have no others to contend with than those farmers directly and individually interested in the "tailings" question. Without doubt these farmers will secure some assistance from others, although there will be some difficulty in procuring aid from those agriculturists at a distance from the land affected by the overflow of "tailings" or "back water." Another thing to be remembered is that, as a general thing, ready money is more plentiful among the miners than farmers, and they will probably receive more substantial financial help from their class than the others can. If extensive litigation is entailed in the settlement of the disputed rights, the money will go a long way in favor of the party having it.

The equitable settlement of the question involves as many points as to admit of very exhaustive argument; but it must be decided before long, one way or another. Those who are defeated or who think their own plan a better solution of the problem, must submit gracefully to the edict of the powers that be; remembering that in matters of this kind a decision for the general good is the most beneficial in the end. That there will be differences of opinion then, as there are now, there is no doubt, but we urge upon both parties moderation in argument and action, and prefer submission to the decisions of the authorities.

Loss of Gold, Silver and Quicksilver.

Although new processes without number have been introduced for the extraction of gold and silver, it is speaking quite within the limits of general experience to say that not more than three-fourths of all the gold and silver is saved by the processes in vogue. When it is remembered that this coast produces upwards of eighty millions of dollars annually, some idea of the value of the quantity lost may be formed.

In gold quartz mining the great want appears to be some agent which will force the imperceptibly fine particles of gold into contact with the mercury, without separating the mercury into such minute particles as to cause it to float away with the tailings. It is perfectly well known that grinding mercury or stamping it too much causes an immense loss of metal and the metal it is employed to collect. What the loss really is it is difficult to compute. An item in last week's PRESS will, however, give an idea, where it is stated that the California mill, on the Comstock, consumes monthly 30,000 pounds of quicksilver which never finds its way back. The Consolidated Virginia mill will use up about as much more, so that the two, even at the present low price of quicksilver, make away with about $1,000 worth a day. This refers to only two mills out of the hundreds in operation on the coast.

It seems impossible to save all this, notwithstanding its great specific gravity when in bulk; finely divided, however, it loses this property practically. Any mill-man can demonstrate the loss by placing a pan at the end of the tailings troughs. No matter how long these troughs may be, how much the mercurial surface, or how many riffles, hides, blankets or sacks they contain, in an hour or so, if he washes out the sedimentary matter in the pan carefully he will find on the edges of the particles of sand a fine white fringe, which if rubbed with the finger will be transformed into globules of quicksilver, holding more or less gold. Here is the greatest cause of loss in quartz mining, and one for which no efficient remedy has yet been found.

In placer mining a still greater loss is experienced through not bringing the gold in contact with the mercury. Much of the gold in alluvial deposits exists in very minute particles, which, although gold is so much heavier than water, will float on the surface of the water. Every miner is aware that fine specks of gold float, so that the majority of these fine particles are lost. If some cheap and effective method could be devised to work the "slum" that accumulates in the vicinity of rich placer diggings, fortunes could be realized. The "slickens," however, are allowed to waste for want of a method of saving the gold. The currents in the sluices and flumes are so strong and swift that a great deal of the gold goes a long way. Even "undercurrents," introduced of late years, although they have been very useful in arresting some of the waste, do not entirely accomplish the object.

These simple facts are well known to miners, and they know that they comprise the plain reasons why so large a percentage of what is in ore or alluvial ground is lost. Processes of various kinds have been devised to prevent loss in different ways, though comparatively few of them have ever been aimed in the right direction. Mechanical means have probably reached their perfection and it remains to be seen if chemistry can bring relief. Quicksilver is the best thing we have to catch gold, but, as any miner knows, it does not perform its duties satisfactorily. If any man can find a way to make it act better than it now does, a fortune awaits him.

Mechanical Ore Concentration and Separation.—No. 11.

[Written for the PRESS by FRANCIS M. F. CAZIN, M. E., Santa Fe, New Mexico.]

Breaking and Classifying by Size

Are simple manipulations controllable in every modification of the action. Common sense and ingenuity will easily control them to perfection. Not so with separation proper. The action is not so exposed to continual inspection; it is not so easily understood and its deficiencies are not so immediately traceable to their causes. Therefore, want of satisfactory success with imperfect contrivances is more frequent. All this may explain the existing distrust spread among American mine owners against mineral dressing, which distrust may do very good service if only carried far enough to prevent application where this method is inapplicable or where other methods are equally or even more profitable. But distrust should not be allowed to go far enough to prevent application, even where no other method is able to utilize the low grade ores accumulating on dump piles or easily extractable from large deposits.

For quartz carrying free gold, no mining engineer experienced in both methods would relinquish the advantages of direct amalgamation; and on ascertaining loss of gold or the presence of other valuable parts in the tailings, the competent metallurgist would not hesitate to utilize mechanical concentration for the treatment of tailings. Without cost for breaking, except a trifle in addition to existing running expenses, not only the greater part of loss may be recovered but the waste of quicksilver can be reduced to almost nothing, as it will be readily recovered, even in the finest floury particles, with the concentrated material in a good jig, provided with steel sieves. On ores carrying copper in grades of whatever denomination, the competent metallurgist will undoubtedly recommend a leaching process in preference to all others, but in case the ores require roasting he will closely examine whether circumstances for mechanical concentration are in his locality not favorable enough to make it profitable to mechanically dress the crude ore.

Argentiferous ores carrying no lead, or only a very small percentage of galena, and such galena not being the matrix of the silver in the ore, will, by the competent metallurgist, be subjected to chlorinizing, roasting and amalgamation as long as it is proved that the silver has a predominant inclination to gather in the finest sizes or slimes, because the percentage of loss in dressing slimes is about equal to the loss in roasting and amalgamating. But if the ores carry a good percentage of galena and the silver-bearing particles are sound (not corroded), possessing their natural cleavage as well as their natural gravity, no hesitation will be shown by the competent metallurgist to determine on mechanical dressing preliminary to reduction. If the ore carries galena in whatever small percentage, and the galena is the matrix for the silver present, there can be absolutely no other or equally profitable way of treatment but mechanical dressing and subsequent smelting of the concentrated material. Thus unacquaintance with the art of mineral dressing should not any longer stand in the way of its application in the great West any more than in the way of leaching, where it is in its proper place either with or without dressing.

The Problematical Intra-Mercurial Planet.

The recent telegraphic dispatch from Le Verrier to astronomical observers, and especially to those on the Pacific coast, asking them to observe the sun's disk for the transit of Vulcan on the 9th and 10th of October, naturally recalls attention to the subject. On this coast the literature on the subject is limited; but in *Nature*, of September 14th, we find a short article concerning it elicited by the supposed passage of Vulcan across the sun's disk on the 4th of April. The few data referred to are therein acknowledged inconsistent with the supposed periods of 28 days, and of 42 days, assigned to the planet. Brief papers on the subject were submitted at the last meeting of the California Academy of Sciences, by the President, Prof. George Davidson of the U. S. Coast Survey, in one of which he states that from considerations based upon a study of the sun spot period of eleven years, a shorter period then either of the above will satisfy all the observations therein mentioned.

He enumerates the observations as follows: Stark, October 9th, 1819; interval of 7,298 days. DeCuppis, October 2nd, 1839; interval of 7,115 days. Lescarbault, March 26th, 1859; interval of 1,090 days. Lummis, March 20th, 1862; interval of 5,129 days. Weber, April 4th, 1876; interval of 189 days. Leverrier's prediction, October 10th, 1876. These intervals do not correspond with the assumed 42.02-day period, or with the 28 day period, but they do correspond with the period of 21 032 days. Thus, says Prof. Davidson, first, 347 periods of Vulcan, 21.032 days, equal 7,298 days; second, 338 periods of Vulcan, 21.05 days, equal 7,115 days; third, 52 periods of Vulcan, 20.97 days, equal 1,090 days; second and third, 390 periods of Vulcan, 21.035 days, equal 8,205 days; fourth, 244 periods of Vulcan, 21.02 days, equal 5,129 days; fifth, 9 periods of Vulcan, 21.03 days, equal 189 days.

Omitting the fifth as a prediction only, and reckoning only from October 9th, 1819 to April 4th, 1876, we have 20,632 days, giving 981 periods of 21.032 days each. The only sensible deviation from this period is in the observation by Lescarbault, that created a fervor at the time but which was quietly dropped by many who criticized the internal evidence of his observations.

A period of 21.03 days for the supposed planet, corresponds to a mean distance of 0.15 (Earth as 1.00) or 13,725,000 miles. The next conjunction should occur on the 31st of October, 21st of November, etc.

Professor Davidson says, I may here intimate that it appears to me quite probable that the eleven-year sun spot period depends upon the perturbative forces of the earth, Venus, Mercury and the undiscovered planet; and that if this view is correct it may aid us in determining the conditions of the finid surface of the sun.

The following is Professor Davidson's paper describing his search for the supposed intra-Mercurial planet, the station being Mount Helena, Napa county: On the 9th of October I received telegrams asking me to observe the sun upon the 9th and 10th of October for the transit of the supposed planet Vulcan across the disk. I had commenced observations on the 6th of October for the possible planet and for sun spots. We had fair weather on the 9th and 10th and the sun was carefully examined with a teleascope of three inch aperture and a power of 85; and adjusted for the determination of position of any object projected on the sun's surface. More frequent examinations were given to the afternoon hours, when the sun was below the horizon of the Eastern observatories.

The method of observing was as follows: At each half hour during the day until three o'clock P. M., and then at each twenty minutes, the border of the sun was carefully examined for a width of 3′ to 5′; the north and south limbs were then scrutinized; and the border again observed. These operations were intended to seize any body that might be seen just entering or leaving the sun's disk and that was projected upon the sun's northern or southern limbs. Then the whole body was carefully watched as the disk traversed the field of view, using a parallactic eye piece to observe every part equally well. After this the border was again examined, and sometimes a second inspection of the disk made, especially in the afternoon.

No spot or planet was visible on the afternoon of the 6th of October. The 7th and 8th were cloudy days. On the afternoon of the 9th there were neither spots nor Vulcan. On the 10th observations were continued from morning to sunset. At 4 45 P. M. two spots were discerned; and in half an hour other smaller ones were visible in the same disturbed area. Each spot was about twelve seconds of arc in its largest axis. No planet was visible during the day.

On the 11th of October observations were continued. The sun spots were not so readily made out, but the disturbed area was increased; and during the afternoon the number of small spots was increased and all evidences of great and violent action visible. No planet was visible during the day. This station is 4,343 feet above the sea, and the border of the sun exhibited very little of the usually confused border from atmospherical disturbances.

Items of Interest from the Mines.

We give below items of interest from prominent mines, most of which are collated from letters of the respective superintendents on file at the offices in this city. Considerable of this news is later than that prooored from the interior journals:

From the Virtue mine, Oregon, news comes that they are clearing away the second level south ahsad, and have resched a point further south than any in the mine, with a favorahle ore body.

In the Lady Bryan, on'sccount of enconnterling a large flow of water in the joint L. & T. shaft, the work of sinking has for the present been stopped and the workmen are now engaged in excavating the foundstions for machinery.

In the Jostice, the winze on 400-level is developing a rich body of ore as depth is stained. Also 500-foot level npraise aod 600-foot level npraise, which ascends the west vein to a hight of 50 feet, thence turning at right angles, passed through a horse a distance of 24 feet, where a valushle discovery was made; further exploration is necessary before the extent is really known. A very important improvement is foond 100 fest to the north of upraise last mentioned, in the cross-cut advancing east on 600-foot level, sill floor, which is making in new unexplored groond.

There are on hand at the mills about 3,500 tons of Belcher ore.

Last week 3,374 tons were sent from the California mine to the mills, and 2,263 tons from the Consolidated Virginia. The ore breasts in hoth mines continne to look well. Little work has heen done on the 1,700-foot level in the Consolidated Virginia mine, owing to the presence of water and imperfect ventilation, hoth of which were expected to he remedied hy this time.

A letter from the superintendent of Raymond & Ely says: The prospect work which was being prosecnted st the west end of the slope on the 8th level has not resulted satisfactorily; the shale made in across the top of the raise and out the fissure off entirely, and not deeming it advisable to proeecute the work farther in that direction, work was suspended. The west drift on the 11th level has been extended 24 feet during the week; the formation penetrated has been of the same character as heretofore reported. The fissure still continues regular and well defined, hot barren.

Letter of the 4th from the Enreka (G. V.) ssye: Our cleao-np for the last six days run off 10 stamps, 12 hoors per day, is 280 oz. of amalgam. The ledge in Eureka proper is n little smaller than it has heen. In the last month we rnn No. 3 north cross-cut 50 feet; the ground continues hard and ugly to work; in one week more we will have the Ingersoll drill started.

In the Baltimore Consolidated a winze has been commenced on the ore hody in cross-cut No. 1, on the 1,050-level, and as depth is gained the ore body widens and is looking fine. The ore in the upraise from cross-cut No. 2 on this level is improving and looking very good. As it is also io cross-cut No. 3.

A letter from the New England smelting and mining compsny says: Onr furnace is in complete rnnning order. There is a large amount of good milling ore now ready upon the dump, and we expect to be turning out hullion hy the middle of December, weather permitting. We expect to be able to smelt 20 tons per day. There are several hundred tons of ore ready for the smelter and a large body in sight. It is estimated that with the present facilities we can supply over 100 tons of fine ore per day to the smelter.

The superintendent of the Hite mine (Calaveras county) says: We have made a very important strike in the east cross cut. The vein is about five feet thiok and very rich. We have driven on it 40 feet east from the cross-cut, and vein improves every foot hoth in richness and size. I look upon this as the most important strike we have made in eight years, as it will no doubt enhance the value of the mine at least $200,000.

Advices from the Crescent say: Mill running steadily. Hendy's feeders do not reqnire to be tonched so far, though the others are working much better than when rnnning the clay. Stopes all through mioe continue to yield their nsoal quality of ore. Crescent drift ledge three feet wide, but not prospecting as well as a few days sgo. Can't tell anything about mill yet.

We have heen shown, hy J. R. Mains, some gold-bearing quartz from Dry Creek, Amador Co., taken from Potosi, Maryland and Dnn Worley olaims. The ore is rich in gold and sulphorets, some of it, we are informed, running as high as $1,500 to the ton. We are promised a general deecription of these mines and their snrrouodings.

Part of the new spur wheol for the Raymond & Ely, at Pioche, has arrived. The wheel it was designed to replace was broken on the 2d of August last. The wheel will soon be in position, when we will hear from the pump again.

A large number of mines in the southern part of Colorado will hs worked all winter. Several of the large mine owners are preparing to run tunnels, and the prospect for active operations during the winter is good.

The tailings mills on Six Mile .sanyon, Nev., are all in full operation.

Remarks on Quicksilver.

[Written for the Press by Samuel Purnell.—No. 5.]

Loss of Mercury.

It is very difficult to ascertain the exact loss in working quicksilver ores. Few managers really know what they lose, because, io this coontry, no assaye are regnlarly made from true samples. The custom has been to assay specimens from time to time, and whether they were to he considered samples or not depended upon the profits or losses made hy the works. When the mine and smelting works made mooey it was thought the furnace and condensers were working nearly up to the full assay; while if money were lost the ores were pronounced too poor to work. Often it was assumed, as a matter of oourse, the apparatus was perfect. This course was not a losing one while mercnry sold for a dollar a pound, for then managers could afford to lose half their metal without knowing it and still make money. But now times have changed, quicksilver is cbesp, and nearly all the mines are closed. It has become a common practice with the inventors of new furnaces to assert that they could save very high percentages; one enthusiastic inventor actually publishing that his apparatus saved 99½ per cent. This is otterly preposterous, but no doubt the gentleman was perfectly sincere in his statement. The moral to be drawn is that few really know what is lost, and when told they will not believe it. Few men of genuine experience estimate the losses at present in California as averaging less than 50 per cent., and in many cases they are believed to be very much higher. As the forms of furnaces and condensers, and the conditions of working, are about the same here as io Eorope, it may be well to estimate the average losses in California to be the same as those at Idria, where the management has always been in able hands, and where alone the real losses appear to be known and have been given to the world. The Idria reports show the average losses in 1870 to have heen 46.70 per cent.; io 1871, 37.10 per cent.; in1872, 48.72 per cent.; and much more, relatively, was lost with poor ores than with rich. In 1873 the superintendent of the Napa Q. M. company, working with the then most approved apparatns, wrote: "In oor works, out of 1,600 tons worked only ao average of eight and one-half pounds of mercnry per ton of ore was obtained, where the ore treated by repeated assays ran from 20 to 80 pounds per ton." Their ores were mostly fine, and there was a great loss of time and labor in moulding them into adobes. There has been found to he a loss of from 10 to 12 per cent. in the ordinary method of assay; so if any practical process will work within 10 per cent. of the total loss it is good enough. In a standard work, ("Phillips' Elements of Mett.," srt Mercury,) it is stated that hy existing processes the loss is so great as to amount to, io some cases, 40 per cent. So late as 1873 the yield of mercury at New Almadeo is said not to exceed 62 oer cent. of that which the ore contains. In 1875 at New Almaden were worked 31,106,200 pounds of ore; average yield, 3 35 per cent; pounds of quicksilver produced, 1,044,072. What the real losses were it is impossible to tell from reading the report, but they seem to have heeo aboot 50 per cent. At Almaden the

THE SUMMIT OF THE ALLEGHENIES.

processes only yielded from one-fourth to one-third of the mercury in the ore.

Miscellaneous Facts.

Notwithstanding the great losses of the ordinary roasting reduction process, it is now the universal one, except for very rich ores, which it pays best to smelt io retorts. But under the ordinsry conditions, the cost of maintenance of appsratus, extra labor and fuel more than compensates for the increased yield with retorts. The cost of working hy the retort process has been variously estimated at from $8 50 to $16 per ton of ore; while the modern shaft furnaces are claimed to work at from $1.25 to $1 50 per ton.

As an instance of

How Cheap Quicksilver Ores May he Worked,

It is well to mention that at Ripa, Tosoany, the Hsehner fornace is used. The ores are very poor, yieldiog only 5 or 6 pounds of mercury per too. The cost of treatment is said not to exceed 58 cents per ton.

At Idria with the Haehner furnace 112 pounds of mercnry cost for its production as follows: £4 for the ore, £1 12e for smelting; aod 8s for package; total £6, or $29.04, equal to 26 cents per pound.

The Sutro tunnel is officially reported to have advanced 14,835 feet, 235 miners' inches of water coming in; 321 feet were made in October and 329 feet in September.

Pennsylvania Mountain Scenery.

It is hut within the last few years that Pennsylvania has acqnired a nsme for her beautiful scenery. Her people have been workers rather than dreamers; she has prodoced many an excellent mechsnic and worthy iron-master, hut few indeed have been her poets; no Irving has yet sprong from her soil to tell the glories of her hills, and no Bryant to sing ths beauties of her waters; her people have been content to let the outside world find out for itself what she had to show more beautiful than black dismonds or red iron ore—and since to travel haa become so common, the ontside world *has* found out, and many are the Centennial visitors this year who will carry home with them, firmly fixed within the memory, delightful landscapes from the land of William Penn, whether of the rounded hills and calmly-flowing waters of the beautiful Ohio, the wooded ravines and hights of the Alleghenies, or the almost English scenery of the garden counties about Philadelphia.

The characteristic of Pennsylvania scenery is its softness of outline. The steepest of the hills slope off to gently rounding summits, and their rough sides are hid beneath a luxnriant growth of forest trees and underbrush. The engraving upon this page depicts one of the wildest scenes along the line of the Pennsylvania railroad. It is at the highest elevstion reached by the railroad, some 2,100 feet above sea level, just east of the three-qoarter-mile-long Allegheny Summit tunnel, and where a little station has been erected, called "Allegrippus," in honor of *Old Allegrippus*, one of the earliest of engines to cross the mountains—a giant among the iron giants of the road, the fame of whose strength and speed is still proudly cherished. The scene is certainly a beautiful one. At the bottom of the ravine sparkles and gleams a little tributary of the Juniata, while on either side the hills stretch up a thousand feet, into the clouds, their rugged sides clothed with a dense and varied growth of oak, chestnut, beech, birch and a thousand other varieties of tree and hush and shrnb; while over all there smiles down a bright, warm sky, made doubly beautiful hy such lovely clouds as Californians seldom see. High up upon the left side of the ravine the railroad has, hy what was considered bold engineering until we of the Pacific slope hegan to huild railroads, fonnd a course for its iron steede, and from the swiftly-moving cars the view down and across the narrow valley is inspiring, and at this season of the yesr, or a little earlier, when the thousand and one trees and ehrubs have put on the many-tinted hues of autnmn, it csn be described by no less word than magnificent.

Mining Accidents.

A miner named George Cunnlngham was killed on the 7th instant in the Lady Washington mine, on the Comstock: Cunningham climbed down the ladders and started to oross the center compartment, when the cage struck him and crushed him against the timbers on which the men stood while working. The cage was going very slowly, as the engineer had been directed where to stop, but before it could be rung up its full weight was allowed to press sgsinst the unfortunate miner.

On the 7th instsnt a fatal accident occurred in the Gonld & Curry mine. The Gold Hill *News* says: The pump rod was heing removed by a large gang of men. Joseph Pierce, one of the miners, was standing on a hoard in the shaft gniding the cable as it was lowered or hoisted in answer to the signals of the men in the incline. The bell rang for the engineer to raise, and it appears that the cable csnght upon s nut on the end of the frail platform npon which Pierce was standing. The board was lifted from under the hapless man's feet, and he fell to the hottom of the shaft, a distance of 100 feet. When his fellow-miners dsscended and found him he was quite dead, the neck and one leg being hroken. When brought to the surface the body, which was not greatly disfigured, was taken charge of by Coroner Hodges, who will hold an inquest. Pierce was a man about 40 years of age and a native of Cornwall, England, where he has a wife and family living.

Bullion Shipments.—Since last report hullion shipments have been made from prominent mines as follows: Virtue, Oct. 30th, $3,500; Leopsrd, Nov. 6th, $6,300; Con. Virginia, Nov. 6th, $53,700—total to date, $1,150,579; California, Nov. 6th, $51,144—total for October, $1,178.163; Northern Belle, Nov.|5th, $20,004.-80; Arizona, 5th, $2,584 75; Modoo, 6th, 500 bars—value this month to date, $21,000; Northern Belle, Oct 31st, $12,002.21; Comanche, 31st, $3,286.81; Oslaveras, Nov. 1st, $2,600; Ophir, 2d, $17,177.81—total to date, $239,634.38; California, Nov. 1st, $105,884.24—total to date, $878,132.78; Con. Virginia, Nov. 1st, $42,340.04—total to date, $1,009,240.42; Ophir, Nov. 1st, $19,236 99—total to date, $222,456.57; Manhattan, Oct. 31st, $12,100—total to date, $119,700.

The double tunnel of the Main Feather River company, to which we referred recently, has been carried under the river for a distance of twenty-two feet, with good prospects of success. But two feet a day osn he pieroed, and it is expected that the work will be completed so as to reaoh paying dirt by the first of January.

South Almaden Quicksilver Mines.

The San Jose *Mercury* says: There are the very best grounds for belief that the Sonth Almaden quicksilver mines will soon command attention in the marts of trade, hearing close resemhlance to that which the New Almaden has so long enjoyed a monopoly of in this country. It is a fair presnmption that the stockholders will he much hetter pleased, even with the Sonth, than were its stockholders in New, through many of its past prosperons years. A *Mercury* representative accepted an invitation the other day from Mr. Adams, president of the company, and made the distance, throngh the Evergreen settlement, hehind the driver's spanking span of chestnuts, in abont ninety minutes, and made a pretty thorough inspection of the works.

The Sonth Almaden mining grounds, comprising an area of 4,200 acres, are locsted some ten miles east hy north from New Almaden. There are at present hut ahont twelve hands employed at the works. These are under the general supervision of Superintendent Goldworthy; Captain Smith, immediate foremsn. The furnace was not hreathing on the day referred to, hut hetween 40 and 50 tons of mineral rock were deposited close hy, ready to he relieved of its alloy; and flasks were waiting to receive the cinnabar. Superintendent Goldworthy is a man to the mining manner hred, and expresses strong confidence in the immediate fntnre of the Sonth Almaden. Captain Smith is also thoroughly experienced in qnicksilver mining, as indeed are all the hands there, and they look for strong development from the float and seam indications in several different portions of the grounds under lease. The management will he ohliged to confine their operations mainly to snrface ore, or shallow diggings for some time, that the yield may pay all rnnning expenses. But as they have a twenty-years' lease they can well afford to wait a while hefore pntting in heavy pumping works, which must finally he done to unwater the heavier hodies of ore. Rock carrying cinnahar very strong is now heing taken ont near the surface on hoth sides of Silver creek, and the cinnahar has also heen found strong in the ledges, cropping ont in several distinct places on the hrow of the hill to the west, from 600 to 1,000 feet distant. These are nnmistakahle indications of strong ledge deposits which must, as has heen inferred, hring South Almaden into prominence in the near fnture.

The settlement is limited at present to three or four plain, unplaned hoard honses located on the west side of Silver creek, under the deep foliage of white and live oak branches.

The Chance in Olive Oil.

We have formerly noted the fact that the California made olive oil is an excellent prodnct, and pleases consumers. It has heen largely introduced in the hotels and restaurants of this city. Owing to the penchant for the imported prodnct, our California oil hears a French hrand even in the honse of its friends. This is to he regretted, because while we are sailing under a foreign flag we are doing nothing in the way of establishing a standard of onr own. We can see no reason why a distinctive California hrand cannot he established, and finally made to secure the position in the markets of the world to which the qnality of the artiole entitles it.

This point is suggested hy the disclosnres which are heing made of the wretched adnlterations which are heing introdnced in the commercial article of olive oil. We read in the *Chemist and Druggist* that "some of the cheaper fixed oils found in the New York market are largely substituted for olive oil. Very little of that which is sold hy grocers is even imported from Europe. A New York merchant who is extensively engaged in hottling this article in imitation of the imported style, informed ns that for the cheapest grade he is in the hahit of putting up refined cottonseed oil, and for a somewhat better hrand the oil of henne. The expressed oil of mnstard, a hy-prodnct in the manufacture of tahle mnstard, is also applied to the same purpose. Onr Frenoh friend, whom we have hefore alluded to, also kindly informed us that in his conntry the ground nut oil (*Arachis hypogœa*) is used to an enormous extent for admixture with olive oil, so that hut very little of the latter is exported pure."

Here is the chance for a pnre California product to sell on its own name and estahlish a fame which will he for a time at least free from the frands of the adulterater. Not only are the French hrands used to cover the compounds prodnced in New York city, bnt even in Franoe, in olive oil, as in wine, the most detestahle frands are perpetrated. We think there is now opportunity for our olive growers to show their true colors, and hy a pure prodnct win the demand for their product.

ANTIMONY MINES.—C. W. Gilbert has sold his interest in the extensive antimony mines in the southern part of the county, to D. L. Healey, of Churchill. The purchaser proposes shipping the ore to San Francisco. The mines are represented as containing the most extensive deposits of antimony ore ever discovered on the coast. The ore is high grade, carrying from 60 to 72 per cent. metal.—*Silver State.*

IT is a curious fact that in the salt mines of Poland and Hungary the wooden pillars, supporting galleries, are fonnd to last nnimpaired for ages, in oonsequence of heing impregnated with the salt, while pillars of hrick and stone, used for the same purpose, crnmhle away in a short time, from the decay of their mortar.

ISSUED OCT. 1st, 1876.

Testing and Working Silver Ores.

The above is the title of an illustrated work of 114 pages, for miners and prospectors hy Chas. H. Aaron, which has just heen issned hy Dewey & Co. Mr. Aaron haa managed to give many useful hints and snggestions, free from all technicalities, and in snch a style as to he easily comprehended. It is written for the miner, with no chemical symbols or metallurgical technicalities to confuse those who are not chemists or metallurgists. The following summary of the contents of the work will give an idea of its scope:

Under the heading of the first chapter, "Testing Ores for Silver," we find paragraphs on ore formation, test for silver, with heat and water, acid or blow pipe. In speaking of testing for a process, the extent and richness of ore is considered, smelting ores, selecting and working sample, appliances for testing, roasting, etc. Under the head of "Working Ores" the author describes Aaron's process, has something to say of snperheated steam, preparation of dichloride of copper and protochloride of copper, use of copper and iron, quantity of chemicals, csrbonate of lime, chloride ores, amalgam, Patchen's prooess, etc. He also describes the methods of working roasted ores, treatment of base metals, stirring, heat of furnace, want of snlphur, etc. Under the head of "Leaching Processes" are the titles, Smelting, Mexican process, Kroencke's process, Chilean process, etc. Under "Pulverizing Machines" are described the arastra and its construction and operation, stamp hatteries, screens, Crocker's trip-hammer battery, Paul's pulverizing harrel, Kendall's hattery, Noice's pulverizer, a cheap rock breaker, etc.

In speaking of amalgamators the author describes a cheap amalgamator, grinding the ore, directions for making a barrel, preventing mechanical wear, use of quicksilver, copper in bars, Freiherg harrel, cheap barrel, trough, barrel on rollers, Aaron's amalgamator, separator, etc.

He describes an improved retort, roasting furnace, furnace tools and furnace huilding. Among the miscellaneous mention may he found Aaron's leaching apparatus, with two or three different arrangements a sm all mill, sampling tailings and settling tanks, dichloride of copper, etc. Mr. Aaron is a practical miner, of long working experience on this coast.

The book is a serviceable one for miners' and prospectors' use. Price, post free, (in leather,) $2.00. Address Dewey & Co., MINING AND SCIENTIFIC PRESS, 224 Sansome street, San Francisco.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the canse of practical knowledge and science, hy assisting Agents in their labors of canvassing, hy lending their influence and encouraging favors. We intend to send none hnt worthy men.

J. L. THARP—San Francisco.
B. W. CROWELL—California.
G. W. MoGREW—Santa Clara county.
A. C. KNOX—Nevada and Montana Territory.
C. N. WEST—Santa Cruz and Monterey counties.
A. C. CHAMPION—Tulare, Fresno and Kern counties.
RICHARD RULE—Nevada
B. GOODWIN—California, Oregon, Washington and Idaho Territory.
A. U. STRONG—Lake and Napa counties.
WM. J. LAWRIE—Sonoma and Marin counties.
G. KUTNOW—San Joaquin county.
H. G. OLIVER—Contra Costa county.
W. D. WHITE—San Bernardino and Santa Barbara counties.

Newspaper Fileholdera.

Dewey's new elastic fileholders (black wainut), size of the PRESS, *Harper's Weekly* and *Scientific American*, for 50 cts. Larger sizes, to suit any newspaper, 75 cts. By mail, postpaid, 10 cts. extra. Cash with all orders. Patent allowed. Address, DEWEY & Co., Pnblishers, San Francisco.

GIVE YOUR FULL ADDRESS when you communicate on business to this office, especially in returning newspapers. The fact that your name is on our subscription list is of no assistance to us. Without sending your post office address we should have to look over thousands ofnames to find yours.

SUTTER CREEK, February 26th, 1875.

MESSRS. DEWEY & Co.—I have received my Letters Patent throngh yonr agency. Aud, for your promptness, accept my thanks. Yours, S. N. KNIGHT.

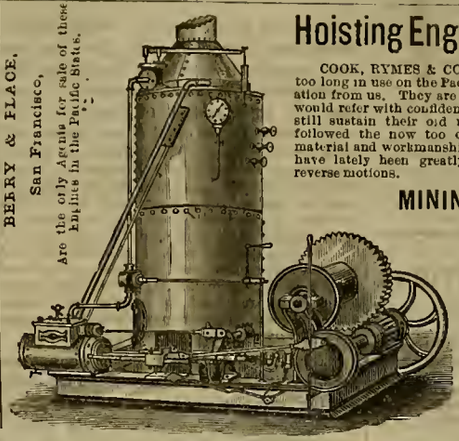
For Sale only at BERRY & PLACE'S MACHINERY DEPOT, San Francisco, Cal.

The Scientific Press Engraving Company.

As has been announced in our columns, this company is prepared to do fine wood engraving on favorable terms. Mr. E. Schultze, managing partner, served a thorough tuition in his branch of art in Germany and New York, and has since had over seven years' experience in designing, drawing and engraving in California. Customers can place their orders in Mr. Schultze's hands with the full assurance of receiving satisfaction as to quality of work and fairness of price.

SEWING MACHINES.—We have a first-class machine we wish to dispose of on favorable terms. Apply at this office.

BERRY & PLACE, San Francisco, Are the only Agents for sale of these Engines in the Pacific States.



Hoisting Engines. Mining Engines.

COOK, RYMES & CO.'S celebrated Hoisting Engines have been too long in use on the Pacific coast to require any special recommendation from us. They are well known from Alaska to Mexico. We would refer with confidence to any one of the hundreds in use. They still sustain their old reputation, the manufacturers not having followed the now too common practice of reducing the quality of material and workmanship to compete with cheaper engines. They have lately been greatly improved by adding large drums, and reverse motions.

MINING HOISTING ENGINES.

(Manufactured by the same parties.)

Our new Mining Engine is built from plans and specifications of several of our MOST SUCCESSFUL MINING ENGINEERS, and the result is the most complete

Double Drum Hoisting Engine

Ever built. Their advantages will be seen at a glance by any one familiar with the necessities of a mine. These engines may be seen in use in Ophir, Con. Virginia, Chollar, Europa, Niagara, Leviathan, Phil Sheridan, and several other mines on the Comstock Lode. For sale only at

BERRY & PLACE,

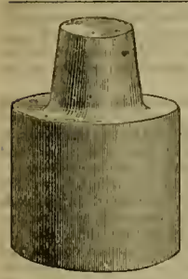
(Successors to Treadwell & Co.)

PAUL'S DRY PROCESS.

I am now prepared to test gold and silver milling ores in any quantity from TEN POUNDS to FIFTY TONS, and assert my ability to prove, by machinery NOW UP, and open to public inspection, and by practical testing of its merits, that I can increase the yield of gold mills, working wet batteries and copper plates, from FIFTY to ONE HUNDRED PER CENT., and on silver ores a much larger percentage than by pan amalgamation, and at less expense than any known method of working quartz well; and from some "gold" ores of California can extract more silver extra with the gold, which is now lost, than all the expenses of mining and milling. Having had 25 years' practical experience in milling gold and silver ores, I presume to know whereof I speak, and AM PREPARED TO PROVE ALL I ASSERT. These mills, for simplicity, cheapness practicability and perfection in working, challenge the skill of the age to surpass. Quartz miners who desire to investigate and have their ore tested, are invited to a critical examination of the machinery and process, and can receive permits for examination, particulars and pamphlets explaining process by calling at my office. ALMARIN B. PAUL.

Room 20, Safe Deposit Building, 328 Montgomery St

BOUND VOLUMES of the MINING AND SCIENTIFIC PRESS from Jan. 1st, 1864, are for sale at this office at $5 per volume, two volumes a year. Unbound at $3 per volume.



PATENTED

CAST STEEL SHOES AND DIES.

Guaranteed Cheaper than the Best Iron.

IMPORTANT NOTICE.

Reduction in Price from 16 Cents to 12 Cents Per Pound.

Owing to our largely increased business, the present low price of iron from which our Steel is manufactured and the improved facilities for casting and forging, we take great pleasure in announcing that from and after this date we will supply our IMPROVED CAST AND FORGED STEEL SHOES AND DIES FOR QUARTZ MILLS at 12 cents per pound, delivered at San Francisco or Sacramento, instead of 16 cents, as heretofore.

We also furnish Steel Plates for Blake and other Ore Crushers, Steel Gut Gearing, etc., for Mills and Hoisting Works, Steel Pan Shoes, Battery Cams and Tappets, etc.

Address all orders, with dimensions or drawings, to

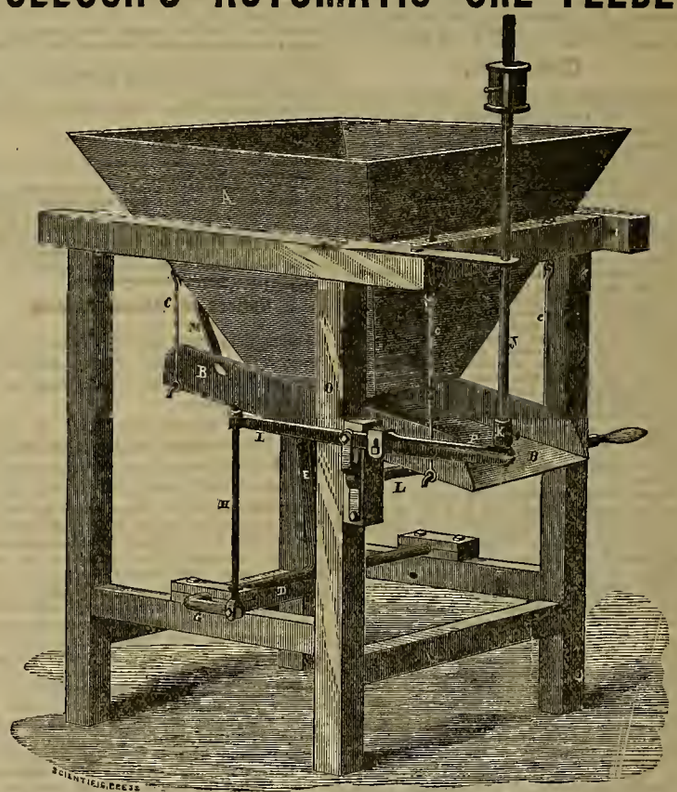
TULLOCH'S AUTOMATIC ORE FEEDER.



The TULLOCH AUTOMATIC ORE FEEDERS have been practically tested during the last year and a half in 40 mills, of from five to 80 stamps each, and have, in every case, given perfect satisfaction. The Tulloch machine is so constructed that the drop of the stamp feeds the ore in just such quantities as the stamps require. Each drop regulates the supply required for the next drop, whether it be more or less, and this is the true principle of an automatic feeder. The tray moves longitudinally, and a stationary scraper forces the material forward at each backward movement of the tray, thus insuring the perfect feeding of all classes of ore, whether it be dry or wet.

We append a few extracts from the many testimonials which we have received from mill men and practical mining men, of the effectiveness and positive action of the Tulloch Feeder. We do not depend solely upon these testimonials, as we are aware that testimonials are easily secured for almost any machine, but the high character of the parties certifying to those herewith given, will establish their value and genuineness:

Mr. Jas. G. Fair has 28 in use; says: I regard them superior to any Feeder with which I am acquainted; I consider no mill perfect without them. Mr. E. R. Burke, Sumner mine, Kern county, has 16: They never get tired; no man living can feed a battery as well; they save us in labor alone $48 a day. Mr. Green, of the Phœnix mill (12), Amador, writes: The first machine we had is working away; is as good as ever; have not spent a dime on it; in use 14 months; you need fear no competition on wet ores. Mr. W. H. Armstrong, of Consolidated Virginia mill: We are running 60 stamps with your Feeders; they give unbounded satisfaction; they have not cost the company one dollar since starting up. Mr. H. C. Bidwell, Supt. Green Mountain and Gold Stripe companies, Plumas county, writes: From the start they have done splendidly; no trouble whatever; requiring but little attention; a boy can manage them; the saving in both labor and castings is fully one-half over the old style of feeding by hand. Mr. Preston writes: I have four of your Automatic Self Feeders, and my mill men each and all say they are the best they have ever used. They are an improvement on all I have ever seen, being simple in construction, and good for either wet or dry crushing; refer to over 40 mills using them; they are guaranteed to give perfect satisfaction. Send for circular.

F. OGDEN, 417 Market Street, S. F.

Continued from Page 317.

progress, the flow of water at the bottom being still quite strong.

NIAGARA.—Sinking the main incline is making excellent progress.

ALTA.—The new pump was got in place and the extraction of water commenced on Monday last.

ROCK ISLAND.—The pumps and hailog tanks are kept steadily running without being able to reduce the water to any very great extent.

WELLS FARGO.—The new machinery is all in place ready to start up as soon as a supply of water is obtained.

WARD DISTRICT.

THE CAMP.—Ploche *Record*, Oct. 29: We received yesterday a private letter from Ward, in which our informant states that the camp is lively and money scarce. Considerable excitement exists on account of town lots, as there have been a few attempts to jump lots already located. It is the intention of the citizens to allow nothing of the kind. There was a meeting held last spring on that subject, and a committee of five appointed to lay out the town and streets and to maintain the same. In one case since then the committee tore down a fence that had been erected on a cross street. Last Tuesday a lot located on some ground that had been donated to the town by the original locator was fenced in by the present owner. On Wednesday a meeting was called and upon organization it was resolved that the meeting "adjourn en masse and remove all obstructions," which was forthwith done, and the ground declared a public highway. The furnaces are running steadily and turning out considerable bullion. The Martin White company are grading out for a mill site and placing some of the machinery in position. Lumber is scarce and high priced.

TUSCARORA DISTRICT.

WORKING ORE.—*Silver State*, Nov. 3: The Humboldt reduction works are now engaged in reducing a lot of 100 tons of ore from the Grand Prize mine; and arrangements have been made by the owners of the Hornet mine to have several carloads of ore worked at the same place. Both mines are situated in Tuscarora district, and the appearance of the ore indicates that it is rich in silver.

WHITE PINE DISTRICT.

BULLION SHIPMENTS.—White Pine *News*, Nov. 4: During the week the Eberhardt & Aurora company have shipped by Wells, Fargo & Co. bullion amounting to $21,326.19, and the Stafford company shipped two bars valued at $3,327.56.

PAY DAY.—The Stafford company, of Treasure hill, who are employing a force of men in their mine at that place, and who have the old "Smoky" mill under lease and are running it, paid off all their employees on Wednesday last. The company have also shipped several thousand dollars in bullion this week. This begins to look like business, and demonstrates what three industrious miners can do who have a little pluck and energy. The company have the best wishes of this community for their success, and we have no doubt they will become wealthy, as they deserve to be.

Colorado.

BOULDER CONCENTRATION WORK.—Boulder *News*, Oct. 27: This establishment is now one of the fixed institutions of Boulder, and has started up to run steadily, so long as ore can be procured. There is no doubt about this matter; it is no longer an experiment, but has settled down to actual business. The tables upon which the concentrate is saved are constructed upon the vibrating principle, extended and improved upon by a careful scientific series of experiments, and the company now issue their price list, and purpose to buy all kinds of ores as stated, giving the miner his money or the privilege of reclaiming the product. Competent miners say that the prices offered are very liberal, especially on the lower grades.

EMPIRE.—Colorado *Miner*, Oct. 28: Negotiations are now in progress to erect a concentrating mill, with the latest improvements, in Empire district. The camp now shows many signs of returning prosperity, and on the completion of these works Georgetown will find a rival in her long neglected suburb.

VICE PRESIDENT.—The owners are pushing steadily on with the drifts from the tunnel, with excellent prospects. The ore vein is scattered at present on this level, but Fliger & Co. hope soon to cut the solid streak exposed in the upper level.

DIAMOND TUNNEL.—A new lode has been cut in the heading, 1,150 feet from the mouth of the tunnel, which shows 10 inches of good ore. It is supposed to be a portion of the lode cut 15 feet back, and will not be explored until the great Dives-Pelican vein ahead is intersected.

PULASKI.—A large quantity of very fine ore is being taken from the great Pulaski vein, by F. M. Taylor, for concentration at the mill of the Clear Creek company. This mammoth vein, in our opinion, is destined to rank with the best mines in Colorado. The owners are Eastern men, inexperienced in the business of mining, and their management has not been such as to produce much money so far, but there is, no doubt, great wealth in the property when rightly managed. The tunnel which is already driven in over 800 feet, is, we understand, to be soon put under contract for completion. This will fully develop the property at great depth, and certainly make it one of the best in the State.

SILVER GLANCE.—The lessees, Messrs. Morseman, Hammond & Co., have a bonanza in sight, which really merits that appellation. They have been driving a drift east from a point 500 feet inside of the Lane tunnel, which is now over 100 feet in length. This drift shows a continuous body of ore throughout its entire length, in two streaks, one on the hanging wall one foot thick, and the other on the foot wall, 13 inches wide. These vary somewhat in thickness, but are remarkably strong and regular as far as opened. The quality of ore has been improving as the drift was run in, and mill-runs have shown a value of 300 to 800 ounces per ton.

Idaho.

BANNER DISTRICT.—Cor. Owyhee *Avalanche*, Nov. 4: The accounts from the Banner mining camp represent that section of the Territory as unquestionably rich in mineral resources, but from a variety of causes operations have not been carried forward with any degree of success. Mr. Crafts, the principal owner of the Banner mill, informs us that the mill was in operation 118 hours during the present season and that during that time the rock crushed yielded bullion to the value of $3,400. The machinery is reported to have worked splendidly, and with such a result and the fact that there is an abundance of the same quality of rock in the immediate vicinity, many persons would be curious to know why operations were thus suddenly interrupted. We interviewed Mr. Crafts on the subject, and learned from him that there had been much difficulty in securing the right kind of an amalgamator to attend to the business, and that his own health was such as would not justify his continuance of the management of operations there this season. There are many reports in circulation concerning the suspension, none of which, however, we feel justified in giving publicity to. We may say, however, that such a district as the Banner, showing up as well as it does in rich deposits, and the lode in different directions still continuing to develop splendidly, it is a matter of surprise that such a camp should be allowed to remain dormant. That boundless wealth exists there, no man acquainted with the country will deny, and it is to be hoped that before this time next year Banner will be doing her part towards contributing to the bullion product of Nevada.

Utah.

LEEDS DISTRICT.—Cor. Salt Lake *Tribune*, Nov. 4: Heretofore our district has been under the necessity of shipping ores to Salt Lake City and Ploche, but now we are soon to assume the dignity of a bullion-producing camp, as the Leeds silver mining company, of San Francisco, have arranged for the erection of a 10-stamp mill, to be running in 60 days. This company, having purchased the Shepard & Lemon and two or three other mines, mean business, and will awake the slumbering denizens of this vicinity from their lethargy, with their 10 stamps crushing the argentiferous sandstone which we count and calculate by acres and miles. A custom mill will soon be erected by Ploche parties, and this will soon be followed by another to meet the increasing demands of the district. The last shipment of ores to Ploche by your correspondent and others, created quite a stir in mining circles, and the result has been that several prominent rock sharps and mill men came over to see what we had in this sandstone country. Several mines have been sold and bonded, and mills are to be erected. Several new mines have been located, and not a few old locations relocated or jumped. There are flattering prospects of one of the richest and liveliest camps to be found in Utah or Nevada. A line shaft has been sunk on the Barbes and Walker mines to the depth of 100 feet, which has cut four feet of ore, and is still in ore at the bottom. The Bonanza company have a good body of ore in their shaft. The Shepard & Lemon claim has several drifts and winzes exposing large bodies of ore. The Scott claim has a fine body of ore, and several other claims have shafts approaching the ore body, which seems to be continuous for miles. On the White or Pride of the West reef the Tecumseh company have a force of men at work taking out some rich ores. Several transfers have been made on the Morning Star reef to new comers, and work will be pushed forward vigorously. Salt Lake capitalists have missed it in not investing in this country. San Francisco will get away with the haggage, and the bullion products will pass through Ploche instead of through your city.

PATENTS & INVENTIONS.

A Weekly List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

FOR WEEK ENDING OCTOBER 31ST, 1876.

NEWSPAPER FILE HOLDERS.—Alfred T. Dewey, Oakland, Cal.

EXPLOSIVE COMPOUNDS.—Egbert Judson, S. F.

MECHANICAL POWER.—Henry J. Gastman, Eureka, Cal.

COMPOUND STEAM BOILERS AND ENGINES.—William Hann, Gilroy, Cal.

POCKETS FOR GARMENTS.—Antonio Diaz Pena, S. F.

TRAPS FOR WATER PIPES AND CLOSETS.—Fred'k Pohley, S. F.

ROW LOCKS.—Eugene Spedden, Astoria, Ogn.

OSCILLATING VALVES.—George W. Van Deren, San Bernardino, Cal.

ADJUSTABLE SCHOOL DESKS.—Bruce Wolverton, Rohnerville, Cal.

RAILROAD SWITCHES.—Asa E. Hovey, S. F.

CAR-BRAKES.—Asa E. Hovey, S. F.

ORE-ROASTING FURNACES.—Henry J. Huttner, S. F., and Robert Scott, New Almaden, Cal.

——The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of mention:

PROCESS OF REFRIGERATION.—R. H. Lucas, S. F. This invention relates to an improved method of refrigeration, or the production of a cold atmosphere in curing and packing houses, refrigerators and other places where it is desired to cure or preserve meats, etc. The object of the invention is to produce an atmosphere having a low temperature and being at the same time dry and free from all impurities. The means by which this is accomplished consists in the application of a non-congealable saline liquid in immediate contact with or exposed to the atmosphere, and having immersed in it a pipe or pipes containing and conducting a refrigerant gas. By this arrangement the refrigerant gas keeps the non-congealable liquid at or below the freezing point of water, while the liquid acts upon the atmosphere, passing in contact with it to absorb all its impurities and moisture, and keep it at a low temperature. The refrigerant agent employed is anhydrous ammonia, but the patent does not confine the inventor to any particular medium for producing the necessary cooling of the non-congealing saline liquid. The application of this invention on a large scale is of great value when substituted for the large body of ice that is now used in curing and packing houses. The apparatus requires but little space, and by means of the very low and dry state of the atmosphere produced by the non-congealing liquid, meats can be effectually cured and preserved.

IMPROVEMENTS IN CLOTHING.—Antonio Diaz Pena, S. F. This invention relates to improvements in clothing, and consists more particularly in an improved method of constructing the pockets of pants, coats and vests; in an improved waistband for pants and overalls, and in the manner of uniting and applying the fly to the front opening of pants and overalls, all the improvements being intended to strengthen the parts and render the articles of clothing more durable. The first place that a pocket gives way is at the corner or angle at each end of the pocket opening. The corners are usually only held together by stitches or some patent fastening device, so that no substantial resistance is obtained except the limited portions of cloth held by the fastening devices or stitches. The improvement consists in forming the pockets without corners and angles to concentrate and receive the strain, consequently avoiding the necessity of using rivets or other re-enforcement for securing the corners. Any strain on the pocket or lower edge of the opening is received by the strength of four thicknesses of cloth alone, the entire rounded or circular portion at each end of the pocket thus giving ample strength of material to resist strain. Instead of the ordinary waistband the inventor forms a yoke which extends from the front around each side of the pants to the back, where the two yokes are united. Each yoke extends downward and backward, and is made in a single piece of goods, thus obviating any necessity of piecing out the portion around the pockets, and as it widens towards the back it gives the wearer greater comfort and a better fit.

VALVE FOR STEAM ENGINE.—George W. Van Deren, San Bernardino, Cal. This improvement is especially applicable to an engine previously patented by the same inventor. It consists in a novel method of constructing the semi-circular cylinder, so that one pattern will serve for both parts. The cylinder can be easily and truly bored out, and the parts are united by a soft metal tongue, which brings them truly together and makes a steam-tight joint. The cylinder is constructed with a diaphragm or head across its center, and its ends are left open. Two pistons work in the cylinder, one on each side of the head, and these pistons are united by a curved arm or piston rod, which passes from one head to another and is connected with a center about which the pistons work and by which they are supported.

WASTE TRAP.—Frederick Pohley, San Francisco. This invention relates to an improved trap for water pipes, and it is more especially useful for making connections with sewers, water closets, etc. It consists in the employment of a pipe having an exit valve at its lower end. This valve is connected with springs which operate to close it after a certain amount of water has run out, and the remainder is retained and acts as a trap to prevent the return of foul odors. The trap may be operated automatically by the weight of water in the pipe or by hand, foot, or other power, as in water closets, and may be so connected in the latter case as to open a valve and allow water to enter and wash out the basin.

ADJUSTABLE SCHOOL DESK.—Bruce Wolverton, Rohnerville, Humboldt county, California. The object of this invention is to provide certain improvements in school desks, and it consists first in a novel construction of the seat and top so that they can be elevated or depressed independently of the main frame and of each other, thereby making it easy to adjust each seat to the size of the pupil without interfering with the others. The invention also relates to a novel means for hinging and locking the seat and top in position and also for adjusting the angle of the top.

Pacific Coast Railroad Items.

Some 250,000 railroad ties have been received by the Southern Pacific railroad within the last two months. This is sufficient to lay 120 miles of road.

The Yuma, Arizona, *Sentinel* reports that the work on the Texas Pacific railway is going on, and the grading party is stretching out on both sides of the river, under charge of Mr. Reynolds, chief of construction, in the temporary absence of Col. Crowford, chief engineer and superintendent.

San Bernardino papers report that the gentlemen of the railroad committee on subscriptions are meeting with excellent encouragement, a very large amount having already been subscribed, and the work not yet completed. They are sanguine that a few short months will see San Bernardino in connection with all the world by steam.

A surveying party from San Francisco and Oakland arrived in Antioch Thursday night and commenced the survey of a route for a railroad from the water front to the Empire coal mine, five miles from that city, owned by Rouse, Hawxhurst & Co.

A correspondent at Seattle, under date of October 20th, writes: The *C. L. Taylor* arrived here last night, bringing for the Seattle and Walla Walla railroad one narrow gauge locomotive and tender. The locomotive was made by Mason & Co. of New York. It weighs 22 tons, and was bought originally for the Stockton and Ione railroad company of California. As soon as it is placed in running order it will be used in carrying the iron rails along the road, and in generally assisting in the work of construction. From present indications we have every reason to believe that the road will be built with but little delay—not only the first section but the entire line through to Walla Walla.

The people of the State of California, upon complaint of L. L. Robinson, bring suit in the Third District Court against the Pittsburg railroad company. The plaintiff alleges that on the 18th day of February, 1862, the defendants presented a petition to the Fourth District Court of Contra Costa county, demanding the condemnation of certain lands of rancho "Los Medanos," (New York ranch) for railroad purposes. The proceedings were had upon the petition, and the court empowered the defendant to use sufficient of such ranch for the maintenance and operation of a railroad. The road was in due time completed. The defendant is charged with having been guilty of a *non user* in this, to wit: since the day of its creation and completion it has not run a passenger car, never owned one, and never had a conductor; has no time table, nor any accommodation for carrying passengers. It never carries any freight for the accommodation of the public. Complainant further avers that the franchise was obtained by fraud and false pretenses, and that the defendant corporation was brought into existence by the stockholders of the Pittsburg coal mining company for their sole use and convenience. Complainant prays that the defendant's franchise be canceled and annulled, and that the defendant be dissolved, and for other relief.

The California Street wire cable railway scheme is assuming shape. The plans and drawings for the work have been completed, and proposals are now being received by the company for the iron and steel necessary for the work. A lot has been purchased on the corner of California and Pierce streets, upon which the building which is to contain the engines, working machinery, cars, etc., is to be constructed. The street is now being sewered as a necessary preliminary to the laying of the track and will soon be completed. The company expect to break ground for the road about the 1st of February, at which time the machinery and working apparatus will be ready. As the residents of California street intend to beautify it so as to make it a grand boulevard, the route will be one of the pleasantest. The road will begin at the corner of Kearny and California streets and the first section up to Fillmore street will be completed by the 1st of July next, and, soon after, the second section to First avenue, which will bring passengers within six blocks of the picnic grounds of Golden Gate park and the race track. Under the present means of travel the workingman who must be at his place of business by seven or eight o'clock in the morning, cannot reside beyond Gough street, and within this limit he cannot purchase a 25-foot lot upon which to build a homestead for less than $3,500 or $5,000, a sum far beyond the reach of the average workingman.

By practically abolishing the steep grades and by shortening the distance so far as pedestrians are concerned, will make the land outside of Gough street easily accessible. A good sized lot can be bought there for from $500 to $800, and the road will be an inducement for the sale of land and the erection of homesteads thereon. The value of property will be increased in a ratio commensurate with the increased population. The estimated cost of the road is put at $250,000. The capital stock is 500 shares of $100 each, making $500,000, all of which amount has been subscribed. The road will be constructed of first-class material, and the cars will run early enough to bring laboring men from the suburbs into the heart of the city in time to go to work, and late enough to bring home the theater-going people. The first section of steel wire cable will be about one and three-fourths miles in length, and the entire cable will run in a cast iron tube, about two feet in diameter. The rails will be of the first quality of steel, and the Clay street railroad grip will be used, for which the company has paid a large bonus.

Lixiviation.

EDITORS PRESS:—In your issue of October 28th, I note a letter from Mr. Ottokar Hofmann, on lixiviation, in which is at least one point of interest. He says: "Knowing that by precipitating with sulphide of calcium the chloride of silver, dissolved in hyposulphite of lime, the former transforms into a hyposulphite, * * * I leached some roasted ore (with water), precipitated all the chlorides (of base metals) and found the clear solution to dissolve chloride of silver very rapidly."

Are we to take this as it reads, and infer that oslcium hyposulphite is formed when a solution (in water) of copper or iron chloride is treated with calcium polysulphide, which is the reagent used in the Kiss modification of Patera's process? If so, I should be pleased to see the formula by which such reaction is expressed.

I should suppose that the decomposition of metal chlorides, in watery solution, by a soluble sulphide, would result in the formation of metal sulphides, and in this case calcium chloride, and nothing else except probably some free sulphur.

That calcium chloride will dissolve silver chloride is, I believe, known, but it will not do so to any great extent unless heated. The explanation of Mr. Hofmann's discovery (?) probably lies in the fact that in making the calcium sulphide by boiling lime with sulphur, a certain quantity of calcium hyposulphite is also produced, so that his "clear solution" which dissolved silver chloride rapidly (I presume without heat) was really a mixture of calcium chloride and the hyposulphite which previously existed in the precipitant, but which was not *formed* in the precipitation. I only notice this because of its misleading tendency.

General News Items.

THE San Francisco candle factory, on the Potrero, was burned on Tuesday last.

THE only news on the Eastern question is that the Powers are discussing the coming conference.

TUESDAY, election day, was a legal holiday all over the country, and banks, public offices and courts were closed.

THE man-of-war *Nelson*, of 7,000 tons displacement, 6,000-horse power and 20 guns, was launched at Glasgow on Saturday.

DR. MEARES reports that small-pox no longer exhibits itself in an epidemic form. During last week only eight new cases were reported.

A fire in Oakland, Alameda county, on Thursday morning, destroyed the Oakland flour mills, the ice factory, and several small dwellings.

CARDINAL ANTONELLI, the eminent friend and counseller of the Pope, is dead. During the political power of the Pope, Antonelli was either the Pope's prime minister or chief adviser.

JOHN J. BERRY committed suicide, on Tuesday, in Calvary cemetery, by shooting himself in the forehead. His wife died recently, and he left a short note declaring that he preferred death to insanity.

PRESIDENT GRANT has accepted an invitation of the Centennial commission to assist in the formal close of the exhibition on the 10th inst. He will be accompanied to Philadelphia by the members of the cabinet.

JUDGE SAWYER has affirmed the decision of Judge Hoffman in favor of the libelants in actions brought by Honolulu merchants against the Pacific Mail steamship *Costa Rica*, to recover damages for goods on board, when the vessel was beached near the Heads on the 17th day of September, 1873.

LIEUTENANT MCCLERNAND, of the Second cavalry, and topographical engineer of Gibbon's command on the Yellowstone river and Big Horn, has made a survey of the Yellowstone river, and a report on its adaptability to steamboat navigation. The report has been forwarded to Washington.

MANY whalers in this city are of the opinion that no fears need be entertained regarding the fate of the men left in the Arctic ocean by the recent disaster to the whaling fleet. They say the autumn winds and currents will drive the vessels upon the southern shore, when the men will have no difficulty in landing. The vessels have a good supply of provisions and fuel on board and the natives are said to be friendly. They think it quite probable that the men and vessels may yet be saved.

The Gould & Curry Fan—The Work it is Doing.

The fan that was started at the east entrance of the Gould & Curry mine about three months ago, and is still running without interruption, is giving a good deal of satisfaction. A reporter of the *Chronicle* accompanied W. H. Patton, construction engineer, one afternoon to observe the working of the fan and note the velocity of the air. The distance from the mouth of the tunnel to the Gould & Curry shaft is 1,500 feet, and the opening into the shaft is 250 feet below the surface, and air-tight coverings are placed over the openings of the different compartments of the shaft to keep the air from entering in from above. The fan when operated as a sucker, by anoking the impure air from lower levels to the opening of the tunnel and thence into the atmosphere. Observations were made yesterday with the anemometer. The instrument was placed in the center of the tunnel about 20 feet east of the fan, and the minute-glass elevated. The fan was making 90 revolutions a minute and the air was coming through the tunnel at the rate of 1,500 feet a minute, which was found to be equal to a displacement of 4,400 cubic feet a minute, the area of the tunnel being 26 6 cubic feet. The temperature of the mine has been greatly reduced since the fan commenced operations, and miners now experience no discomfort whatever in working even in the lowest levels.—*Virginia Chronicle.*

KNIGHT'S American Mechanical Dictionary is a book for all persons who make, buy, sell, use, or want to know anything about tools for machines, or are curious as to the history and development of mechanic art. It is a descriptive word-book of tools, instruments, machines, chemical and mechanical processes; civil, mechanical, railway, hydraulic and military engineering; a history of inventions; general technological vocabulary; and digest of mechanical appliances in science and the industrial and fine arts, etc. For circulars or price address or apply to A. Roman & Co., wholesale and retail booksellers, 11 Montgomery street, San Francisco.

GLENN'S SULPHUR SOAP is not only a curative for specific inflammations of the joints and eruptions of the skin, but it renders the complexion fair, and the texture of the cuticle velvety, and the cheeks blooming with the hues of health. Sold everywhere.

"Faith and Confidence"

LIVERMORE, Oct. 1st, 1875.

MESSRS. DEWEY & CO., Patent Solicitors: *Gentlemen*—Yours of the 29th ult. containing my patent to Elevated R. R. duly received, and I hereby return my sincere thanks to the MINING AND SCIENTIFIC PRESS Patent Agency for your promptness and honesty in regard to our business connections. I have received a flood of circulars from Eastern firms, desiring to deal with me, but I have declined any communication with them and prefer, as soon as circumstances will permit, to negotiate with and patronize a home institution; one in which I have faith and confidence—DEWEY & CO.

Again thanking you for your promptness in securing my patent, I remain, obediently yours,

WM. H. HARRISON.

HARD ON THE PUBLISHERS.—Some of our subscribers when called upon by our agents insist that they have sent us notices through (perhaps) a neighbor, the postmaster, or a letter, and we have taken no notice of their orders, for which they feel hard towards us. Now, we never received such notices without responding to them. *It would be suicidal to our interest to ignore them.* The fact is that it too frequently happens that people misdirect their letters; too frequently forget to put the right (or any other) kind of stamps on their letters; they too often send a copy of the paper back, which may never reach our business office, or if it does reach us, may lack the name of the town and county in which the subscriber lives, in which case we cannot (if we have his name) tell what part of our list to find it, to cross it off or change it, without looking over some 10,000 names. Postmasters and their clerks make omissions and mistakes as well. ☞ When you have business with this office remember postal cards and letter stamps are cheap, and ask no one to do that which you can well do yourself. tf

HOW TO STOP YOUR PAPER.—If a subscriber wishes to stop his paper, do not direct the postmaster to return your paper. That will not stop it. Do not write upon it and return it yourself. That lays you liable to a fine. There are three ways to stop it: 1st. When you subscribe, state that you wish the paper to stop at the expiration of the time paid for. 2d. If you did not so expressly order, send a postal card, to reach us any time before the expiration. 3d. If you have neglected these two simple methods, and the time to which you have paid is past, send a letter enclosing pay for each paper issued since your subscription expired, at the rate of eight cents a copy or 33⅓ cents a month. If your paper does not stop promptly thereupon, you may be assured your letter has been misconstrued; and, to test the fact, send a "postal" at once, that measure may be instituted for finding it or recovering the money.—*N. Y. Independent.*

HAMILTON, NEV., May 28th, 1876.

To Messrs. Dewey & Co., Patent Agents:

GENTLEMEN—I write to acknowledge the receipt by express of the U. S. letters patent on my invention for breech loading ordnance, and to tender you again my very sincere thanks for the careful attention you have bestowed upon my application since I first placed it in your hands for the evident great interest you have manifested in it, and for the uniform patient and cheerful courtesy which has constantly marked your correspondence in reference to it. I have had some dealings with other agencies in the same line in times past, and I can assure you that my correspondence with yours has been more pleasant and satisfactory than with any others, and I shall always take great pleasure in recommending your agency to any and all my acquaintances without hesitation or reservation, as I should certainly prefer to entrust my own business in your hands should I have any to transact in the same line hereafter. Yours, etc., J. R. N. OWEN.

WOODLAND, CAL., Aug. 8th, 1876.

MESSRS. DEWEY & CO.—*Gents:* Your letter containing the patent for my Centennial churn has come duly to hand, and you will please accept my many thanks for the prompt manner in which you attended to the business intrusted to your care, and I will take great pleasure in recommending you to any one having anything to attend to in your line. I am having a number of the churns put up, which will be ready for sale in a few weeks. Yours truly, JAMES ROOT.

CAMPO, SAN DIEGO CO., CAL., July 3d, 1874.

MESSRS. DEWEY & CO.—*Gentlemen:* To-day I received the patent and other papers of my animal trap, that you so successfully worked through the patent office for me, for which please accept my best wishes. The chances are that I will have another application for you to make for me before long. I am well satisfied with your manner of doing business, and I think inventors of this coast stand in their own light when they do not put their business into your hands.

I remain yours truly, A. M. GASS.

MINERAL CITY, WHITE PINE CO., NEV., May 2d, '76.

MESSRS. DEWEY & CO.—*Gentlemen:*

I have just received Canadian letters patent for Fuse Lighter. Also, Canadian letters patent for the Drill Extractor. I return you my thanks for the able manner in which you have conducted the business.

Yours respectfully, JOHN W. PLATT.

GOOD PRINTING INK.—We prefer Chas. Eneu Johnson's printing inks, having used them on this paper for the past four years. H. S. Crocker & Co., printers, stationers, blank book and paper dealers, are Johnson's S. F. agents.—DEWEY & Co., Publishers.

Designing and Engraving at This Office.

We are prepared to do fine Wood Engraving for illustrating Landscape Scenery, Buildings, Machinery, Works of Art, Manufactured Articles, Trade Marks, Seals, Etc. We have a first-class

Machine for Engraving

A portion of the work, which can be finished thereby more perfectly than by the eye and hand alone. Our patrons can depend upon first-class work always, and at reasonable prices. Samples can be seen at our office.

UNITED STATES

Mineral Land Laws, Revised Statutes,

And Instructions and Forms Under the Same.

We have just issued a pamphlet containing the general mineral land laws of the United States, with instructions of the Commissioner of the Land Office. The contents of this pamphlet comprise all of the Government laws with relation to mineral lands of interest to the mining community, as follows: Mining Statute of May 10th, 1872, with Instructions by the Commissioner of the Land Office; Mining Statute of July 26th, 1866; Mining Statute of July 9th, 1870. Forms required under Mining Act of May 10th, 1872, as follows: Notice of Location; Request for Survey; Application for Patent; Proof of Posting Notice and Diagram of the Claim; Proof that Plat and Notice remained Posted on Claim during Time of Publication; Register's Certificate of Posting Notice for Sixty Days; Agreement of Publisher; Proof of Publication; Affidavit of $500 Improvements; Statement and Charge of Fees; Proof of Ownership and Possession in Case of Loss or absence of Mining Records; Affidavit of Citizenship; Certificate that no Suit is Pending; Power of Attorney; Protest and Adverse Claim; Non-Mineral Affidavit; Proof that no Known Veins Exist in a Placer Claim, etc. There is also given the U. S. Coal Land Law and Regulations thereunder. The work comprises thirty pages, and will be sold, post-free, for 50 cents. It should be in the hands of every one having any mining interests. DEWEY & CO.,

Publishers of MINING AND SCIENTIFIC PRESS, S. F.

To Mining Secretaries.

An amendment to Section 336 of the California Code, taking effect July 1st, 1874, provides that in addition to the regular publication, daily or weekly, of the assessment and sale notices as heretofore,

PERSONAL NOTICE

Must be served as provided in the following quotation from the law:

"The notice must be personally served upon each stockholder, or in lieu of personal service, must be sent through the mail, addressed to each stockholder at his place of residence, if known, and if not known, at the place where the principal office of the Corporation is situated."

The above refers to the ASSESSMENT NOTICE only. Advertisers in the MINING AND SCIENTIFIC PRESS will be furnished with copies of assessment notices printed on slips suitable for serving personal notice under this law at short notice.

DEWEY & CO., Publishers.

Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

Office Cascade Blue Gravel Mining

Company—NOTICE:—A meeting of the stockholders of the Cascade Blue Gravel Mining Company will be held at the office of the company, 311 California street, rooms 3 and 4, second floor, San Francisco, Cal., on Monday, November 20th, 1876, at two o'clock P. M., for the purpose of disposing of the company's stock, and authorizing the sale of the entire property of the company, with any other business that may come before said company. R. F. KNOX, President,

J. M. BUFFINGTON, Secretary.

San Francisco, Oct. 13th, 1876.

Eagle Quicksilver Mining Co.—Location

of works Santa Barbara county, Cal. Principal place of business, San Francisco, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 30th day of September, 1876, an assessment (No. 9) of two hundred and fifty ($250) dollars per share was levied upon all the shares of said company, payable immediately, in gold coin of the United States, to the Secretary, at his office, rooms 5 & 6, No. 302 Montgomery street, San Francisco, Cal.

Any shares upon which said assessment shall remain unpaid on Wednesday, the 29th day of November, 1876, shall be deemed delinquent, and will be duly advertised on Saturday, the second day of December, 1876, for sale at public auction, and unless payment shall be made before, will be sold on Monday, the fourth day of December, 1876, as provided by the articles of agreement of said company, to pay the delinquent assessment, together with cost of advertising and expense of sale. By order of Board of Trustees. WM. H. WATSON, Secretary.

Best of its kind in use. Price, complete, $215. Also, small Pony Planers and Planing Machine Knives, which are recommended as superior and extra in quality. 100 Scroll work designs free on receipt of stamp. For circulars giving detailed information, address

Patented Mar. 30th, 1875.

GEO. PARR, Buffalo, N. Y.

THE O'HARRA

CHLORIDIZING FURNACE.

Guaranteed to Chloridize from 85 to 95 per cent. of any gold or silver ores that are not more profitable for smelting. Will also desulphurize ores and put them in proper shape for working in cupola furnaces.

Cost of Roasting and Chloridizing by this Process:

Two cords of wood at $6	$12.00
Two firemen at $4	8.00
1500 lbs of salt at 1½c	22.50
Wear of shoes and power	1.50
Cost for 15 tons	$44.00
Cost for one ton	2.93½

In a furnace of three or four times this capacity the cost is decreased by 20 per cent.

The furnace is now working successfully at the Poe Consolidated Co.'s mines, in the Peavine District. For further information, apply to

D. J. O'HARRA,

Reno, Nevada.

PICKERING ENGINE GOVERNOR.

Vallejo Foundry, October 17th, 1876.

MESSRS. NEYLAN & YOUNG, San Francisco,
Agents "Pickering Governors."

Gents:—The 10 two-inch Improved Speed Adjusting Governors I bought of you this year for my Patent Straw Burning Threshing Engines give splendid satisfaction. They far surpass for regularity of speed any Governor that I have ever seen, and I have seen all of the best kinds. I have seen the main belt fly off the pulley several times this season while threshing, and the engineer did not discover it, so perfectly was the speed maintained, until he was told of it; this I consider something wonderful; I consider the Governor absolutely perfect, so far as speed is concerned. I bought, and put on to one of my engines a Shive Governor, to see which was the best, and after one season's trial I have no hesitation in saying they are as far sup rior to the Shive, or any other Governor that I have seen or used, as the Shive Governor is to the old Butterfly Valve Governor. I wish you would send me the lowest price that you can furnish 25 Governors for next season's engines.

Yours, respectfully, I. L. HEALD.

LOOK

The Great Western Scroll Saw Co.'s New and Improved $5 00 Foot and Steam Power Scroll and Bracket Saw is the best one yet iovented. With it men and boys are making from $3 to $10 per day. We will send you a Machine, six Saws, 15 Patterns and two feet of prepared wood on receipt of $5. Address,

F.—*Gents:* I am much obliged to you for courtesy shown me, and am well pleased with the manner in which you have done my business, and assure you, will cheerfully recommend you to my acquaintances needing such services. Hope to have a case again before long, of my own. I have been an inventor all my life, but let others reap the benefit, or had work stolen from me. Please have the extra copies of my patent, etc., mailed to me direct, and oblige Yours truly, J. H. WOONRUM.

SACRAMENTO, May 29th, 1875.

MESSRS. DEWEY & Co.—*Gentlemen:*

Yours of the 27th inst. is received. The patent came duly to hand yesterday, by express. Please accept thanks for your promptness in obtaining the same.

Very respectfully, DUNCAN BEAUMONT.

Mining and Scientific Press,

Is the leading mining journal in America, and enjoys a large circulation among the more intelligent operators and workers in the gold fields of the world.

As a scientific and mechanical representative of the Pacific Coast, it is decidedly popular and a standard journal with the most thrifty industrial people of the Pacific States and Territories. Its authority is of the highest order, and its usefulness in its special sphere unrivalled.

Every public library, mining engineer, metallurgist, mining operator and intelligent mechanic and manufacturer will find profit by its reading.

Subscription, $4 a year, in advance. Sample copies post paid, 10 cents. As an

ADVERTISING

Medium for the Pacific Coast, it is superior to any other journal for all kinds of mining and hydraulic machinery and other mechanical work, building materials new manufactures and inventions. Our rates are very reasonable compared with those of other first-class journals. DEWEY & CO., Publishers.

Scientific and Practical Books on Mining, Metallurgy, Etc.

Published or issued, wholesale and retail, by DEWEY & CO., MINING AND SCIENTIFIC PRESS Office, S. F.

BY GUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST.

Roasting of Gold and Silver Ores, and the Extraction of their Respective Metals without Quicksilver. 1870.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus.

It is a work of great merit, by an author whose putation is unsurpassed in his specialty.

Price $2.50 coin, or $3 currency, postage free.

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequaled by any other published, embracing the subjects treated. Its authority is highly steemed and regarded by its readers; containing, as it oes, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot he found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE REDUCED TO $5.

APPRECIATION ABROAD.—We copy the following from the *Mining and Monetary Gazette*, of London, Eng.: "We deemed it advisable, as affording valuable information to our readers, to publish in recent issues of *The Gazette*, the full text of the "United States Mining Laws and Instructions, by the Commissioner of General Land Office," taken from our talented contemporary, THE MINING AND SCIENTIFIC PRESS, of San Francisco. The documents have now been issued in a handsomely-bound volume by Messrs. Dewey & Co., the publishers of our transatlantic contemporary, and it will be found very useful to those already interested in American mines, and to others who may be tempted to embark in that enterprise in the States."

THE MINING AND SCIENTIFIC PRESS is the leading journal of America. New processes and mechanical inventions are illustrated and discussed in its weekly issues. It is a 16-page sheet, handsomely printed, for $4 per year. Dewey & Co., publishers, San Francisco. —[Mt. Lincoln News, Alma, Colorado.

"SPEAKS WELL," ETC.—We would return thanks for an exchange and back numbers of the MINING AND SCIENTIFIC PRESS, published by Dewey & Co., of San Francisco, Cal. It is a well edited, interesting, and valuable journal, and speaks well for our Pacific neighbors.—*U. S. Milling and Manufacturing Journal.*

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO., Patent Solicitors.

SAN FRANCISCO, SATURDAY, NOVEMBER 18, 1876.

VOLUME XXXIII. Number 21.

Items of Interest from the Mines.

We give below items of interest from prominent mines, most of which are collated from letters of the respective superintendents on file at the offices in this city. Considerable of this news is later than that procured from the interior journals:

From the Melones Consolidated company, which has formerly yielded such rich telluride ore, the report of the 12th says: Stopes above lower tunnel are yielding good ore; one has gold in sight all the time. When south drift on 30-foot level is run in say 20 feet, shall, unless instructed to the contrary, sink down 25 feet. Shaft at this point now showing gold in the ledge.

The shaft of the Mint mine is now down 1,301 feet.

The upraise from cross-cut No. 2 on the 1050-foot level of the Baltimore is improving and continues in good ore.

The pump on the Hale and Norcross lowered the water 24 feet last week.

Letter of the 12th from the superintendent of Crown Point, says: The incline is down 137 feet below 1800-foot level, leaving 52 feet on the slope to run to reach 1900-foot level. The Burleigh drills are working admirably; with them we are making three feet per day in the incline, a great saving of time and money over hard labor. We have stopped extracting ore and are making necessary drifts of men in consequence. The Rhode Island mill will shut down as soon as the ore on hand is worked up. The combination pump is now taking our water, and so far as at present tested, is working well.

The various ore breasts on the Consolidated Virginia are looking well. The large blower on the 1500-foot level at the double winze is erected and connected with the large air pipe.

In the Justice mine the 400-foot level northeast drift winze and ore stopes as a whole is looking much better than at any time since the development was made; 500, 600 and 700-foot levels, ore stopes produce their regular uniform grade ore; main north drift 600-foot level looks remarkably well and is advancing in new unexplored ground. North and south drifts on 700-foot level are developing an extensive as well as a valuable body of ore.

The average of ores worked the past week from the Manhattan has been $180 per ton.

In the Best & Belcher the large blower at the double winze on the 1500-foot level is erected and connected with the large 15-inch air pipe which has been extended to the 1700-foot level. It works splendidly.

Operations at the Challar last week were as follows: No. tons extracted, 723½; No. tons forwarded to mills, 894½; average assay value of ore mined, $31.50 per ton.

The work on the 600-foot level south is being pushed ahead as fast as possible, and at present with most gratifying results. The face of drift is showing over two feet of very fine ore, assays from which go from $43 to 1,260. There is no doubt but a short time will develop a splendid body of ore at this point in the mine.

Advices from Virginia City dated the 14th, say that a party of gentlemen, consisting of Lorenzo Sawyer, United States Circuit Judge; Hillyer, United States District Judge; R. S. Messick, attorney for the Comstock mining companies; T. H. Williams, attorney for the Sutro tunnel company, and Adolph Sutro, had a narrow escape from death, on Sunday noon, while inspecting shaft No. 2 of the Sutro tunnel. They had no sooner left the shaft building than the fly-wheel of the hoisting engine, weighing four tons, burst, making a report like that of artillery, and by a centrifugal force sending fragments weighing from 100 to 1,000 pounds in every direction, and through the roof, some of them landing on the hill to the westward, 500 feet distant. The damage is rapidly being repaired, and work in the tunnel header was only delayed one day.

Ophir produced in October $250,000; Belcher, $190,000; Chollar, $49,100; California, $1,178,209; Con. Virginia, $1,150,600; Justice, $174,000; Leopard, $70,000; Manhattan, $119,700; Northern Belle, $171,600; Ontario, $64,900; Tybo Con., $70,000; Modoc Con., $40,000.

Improvement in Hinge Joints.

Menzo Spring, of this city, has recently patented through the Mining and Scientific Press Patent Agency, a new and useful improvement in hinge joints, which we herewith illustrate:

This invention, while susceptible of a wide range of application, is especially adapted to the needs of that class of hinge-joints which are employed in artificial legs at the knee-joint or articulation, where the combined qualities of lightness and strength to resist the usual strain on such parts are great desiderata, and a distribution of bearing and wearing surfaces essential to obviate and overcome the constant wear by friction, means also being employed, whereby, in case such difficulty be not entirely overcome, a repair may be readily effected without injury to the artificial leg or joint.

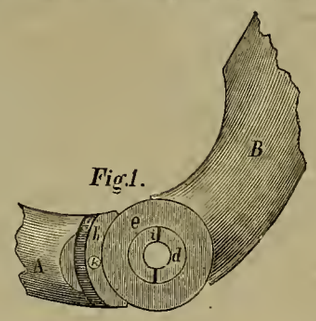

Fig. 1.

Fig. 2.

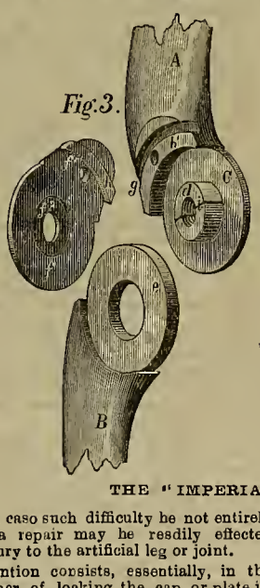

Fig. 3.

Fig. 4.

THE "IMPERIAL" HINGE JOINT.

The invention consists, essentially, in the novel manner of locking the cap or plate in position, as hereinafter more fully described.

Referring to the accompanying drawings, Fig. 1 is a side view of the joint, with the plate or washer, *f*, removed. Fig. 2 is a section, and Fig. 3 is a perspective view of the different parts of the joint separated. Fig. 4 is a top or plan view of the cap-plate and full joint. In Fig. 1, *A B* represents the two bars of the improved hinge-joint. The bar *A* is provided at one end with a disk-shaped seat, *C*, from which rises a hollow and centrally-located hub, *d*. A ring-plate, *e*, is formed upon one end of the bar *B*, and fitted over this hub in order to form a joint or junction of the two bars.

In order to relieve this junction of parts from such lateral strain as would, in case an ordinary washer or protecting-plate and screw were employed, materially impairing the joint, the inventor forms or casts the washer or cap-plate, *f*, with a suitably-shaped extension-piece, f^1, and connects this said piece with the bar *A* by means of a lock or dowel-fastening.

The present construction of this lock or dowel-fastening consists of a curved rib, *h*, cast transversely across the under side of the extension of the cap. This rib *h* is formed to fit with a correspondingly-shaped groove, *g*, in the bar *A*, so that when the cap is placed over the hub and side of the joint it adds materially to the strength of the joint, preventing lateral bend at the hub, and rendering it as effectual for resisting all ordinary strain, as if of solid construction. A recess, f^2, formed upon the under side of the cap *f*, fits over the hub *d*, as shown in Fig. 2, in order to protect the screw from strain. The cap is also further secured in place by means of a screw or screws, *k*, which may pass into the rib *h'*, between the groove *g* and the ring-seat. Any dowel-fastening, however, may be employed in this connection, so that it may be remote from the hub, and securely interlock the washer-plate with the arm.

The screw, which passes through the washer and the hub, will be entirely freed from antero-posterior strain, and removed from contact with the working surfaces of the device, and protected from lateral strain.

As joints of this class are liable to become worn by reason of the constant use to which they are subjected, Mr. Spring forms a split, *i*, in the hub *d*, through which one end of a thin flat wire (equal in thickness to the portion worn away) may be inserted, and said wire then bent around the hub half way, and the end of the wire inserted in the opposite split, thus effectually rendering the joint as tight as in the first instance.

Those desiring further information on this subject may address Menzo Spring, 166 Tehama street, San Francisco.

The furnaces at Ward district are both running, and the mill is progressing nicely.

Mining Suits.

There is trouble in the Lady Bryan company. George W. Reynolds brings suit in the Nineteenth District Court against the Lady Bryan mining company *et als*, to secure the issue of an order of injunction restraining the defendants from proceeding with the sale for delinquent assessments, levied September 15th, or selling any stock so advertised to be sold until the further order of the court, that a receiver may be appointed to take charge of said company. It is alleged that 13 assessments have been levied, aggregating $675,000, and there has been expended not to exceed $350,000, and that the balance has been squandered by the board of trustees of the company; that one of the trustees has not fully paid his proportion of the last three assessments, but has had the same fraudulently marked paid by the secretary; that the books of the company show, under the head "bills payable," $30,000 due by the said company, in notes of said company, but do not show to whom the same are payable nor for what indebtedness said notes were given, and that plaintiff is informed and believes that the said notes were fraudulently issued by said board, without consideration. The sum of $25,000 is alleged to have been expended in collusive purchases. It is also alleged that while plaintiff was inspecting the books of the company, they were mutilated and amended. He finally alleges that if said corporation continues to be managed in the same manner and by the same persons, its property will be wasted and extinguished and the stock of the said company will become worthless and the corporation insolvent, and that a receiver is absolutely necessary to protect the rights of the stockholders.

Upon this complaint, Judge Wheeler has granted an order to show cause and an injunction restraining said delinquent sale.

James H. McCord *et al.* bring suit in the Nineteenth District Court against the Oakland quicksilver mining company. The plaintiffs allege that they are, and for a long time have been, owners in common with defendants, of land in Sonoma county known as the "Lost Ledge;" that defendants deny their right, and forcibly hold possession, and that they have taken upwards of $100,000 worth of cinnabar from the premises. Plaintiffs ask damages in $100,000 and the recognition of their rights.

In the Twelfth District Court L. L. Robinson has commenced suit against the Pittsburg coal mining company, Contra Costa county, to recover $5,000 damages done to his lands and improvements; that the defendant be enjoined from depositing more waste matter on or in Markley creek; that defendant be prohibited from discharging water from its mines into the creek, or from washing refuse material of the mine into said creek.

In the United States Circuit Court, A. P. More, of More Brothers, Santa Barbara, brings suit against Thomas A. Scott, Barker Gummere, Thomas Bard, H. M. Newhall and the Philadelphia and California petroleum company. It is alleged that in 1864 Thomas A. Scott became possessed of the property of the petroleum company, by buying in the mortgages on the property, while he at the same time was the principal director of the company. He caused them to be foreclosed to pay the mortgage debts, which nominally amounted to $81,759, but in reality to about $42,000, a fact alleged to have been well known to Scott. Under a decree of foreclosure he caused all the landed property to be sold for about $90,000. It is alleged that the property was then at least worth $350,000, and is now valued at $500,000. The plaintiff being a stockholder of the company, asks for an accounting between Scott and the company and ascertain what is really due him from the company on account of the mortgages, that the property be sold under the direction of the court, the other *bona fide* debts paid and the surplus money divided among the stockholders. One hundred and seventy thousand acres of land in Los Angeles and Santa Barbara counties are embraced in the suit.

A Brick Machine Wanted.—Francis A. Drake writes us from Prescott, Arizona, to gain information of a cheap and simple brick machine to run by horse-power. If any of our subscribers know of an effective machine in the market, will write to us or our correspondent, they will confer a favor. Such things should be advertised.

Improvements in Treating Ores.

The depression which has for some time prevailed in the metsl trades has certainly been prodnotive of one advantage—it has caused thoee who are engaged in the extraction of metals from their ores to exercise their ingenuity to find waye of doing it more economically or efficiently; and msny of the inventions recently patented give at least some proof that their efforts have not been fruitless. For example, Mr. George Dalton, of Leeds, has designed an improvement in Blake's stone-breaker, with a view to render the application of that machine still more extensive. According to the improved arrangement, the face of the movable jaw ia provided with teeth or corrugations of any suitable shape and pitch, and extending straight from the top to auy required distance below which the teeth or corrugations, which may he either of the same or smaller pitch as the upper ones, are diverted laterelly as has previously been proposed; hut according to the present invention, in lieu of msking the front face of the teeth a cortinuous contour from the top of the jaw to the bottom thereof, the lower or diverted teeth recede—that is to say, the teeth are so arranged that the face of the upper teeth projects to some extent beyond the fece of the lower, or diverted teeth. The stationary jaw is provided with upper teeth and lower diverted teeth in a similar manner, but the teeth are arranged by preferenoe so that the face of the teeth ie straight or forms a continuous contour from the top to the bottom; or the stationary jaw may he made of a counterpart form to the movable jaw or, otherwise, the object being to cause the stone under operation after it has been first broken by the upper teeth on reaching the top of the lower or diverted teeth to roll or turn over by reason of the sudden cbange or recession in the plane of the face of teeth from the upper and lower sets of the teeth of the movahle jaw projecting the one beyond the other, wherehy the stones are reduced to a more perfect cnboidal form in lieu of a semi-elongated form, as is frequently the case when operated upon in the apparatns as previonsly constructed.

Another improvement due to the same gentlemsn, and of still more importance to miners, relates to machinery for crushing or reducing stones and other hard and hrittle snbstances to a fine state of division, and it consists in the employment of two discs, the one rotating and the other stationary, hetween which the snhstances under treatment are to be operated on. The discs are provided with teeth or projeotions, arranged by preference in radial sets, either all of the same dimensions or otherwise, over the whole or any reqnired portion of the face of the discs, and which form the acting or reducing surfaces. The rotating disc is mounted in a suitable frame or cssing on a shaft or axis, by preference arranged horizontally, and provided with driving pulleys and gear, eo as to enable the diso to be driven alternately in opposite directions, in order to equalize the wear of the teeth. The stationary disc is fitted in the frame in such a manner as to admit of its position relatively to the rotating disc being adjusted to snit the degree of division to which the substances are to be reduced. One or hotb of the discs is or are made slightly dished or ooncave for the reception of the substances to be operated upon, and which are fed thereinto from a hopper through an apertnre in the center of the stationary disc. The teeth of the diso are made of hard or chilled cast-iron, by preparing a metal plate or mold to the ehape of the conterpart of the diso with its teetb to be produced, and first pouring in whito iron in a molten condition to a sufficient height to form the teeth, and then filling the mold with hematite or other suitable iron in one continuous operation, wherehy great durahility of the wearing surfacee of the disc ie obtained.

A modification of Carr'e disintegrator, applied to the pulverizing of ores, hae heen designed by Mr. J. Francois, of the Vieille Montagne company. The apparatne he proposes consiste of a hed-plate on which ie fixed a oasing provided with doors for giving acceae to the interior; a top crose frame supported on the tope of fonr columne bracing the whole firmly together. The columns are firmly bolted to a suitahle foundation, the bolte also serving to fix the hed-plate; there is an aperture at the middle of the top frame to receive the hnsh in which the upper jonrnal ot the shaft revolves, the said bueh being made in three parts and centered in the aperture by means of wedges made adjnetable by bolts; there is an intermediate cross frame also fixed to the colnmns, and provided at its center with a sinffing hox through which the vertical ehaft of the mill passes. To the frame is attached a cover in which there are two apertures, one for ehovelling in raw material and the other for receiving the grose fragmenta from the sizing trommel; horizontal discs are fixed one above the other on the ehaft at proper intervale apart; and there are conical hoppers or shoots for returning the mattere after heing projected hy one diac to the center of the diso next helow; toothed or ribbed plates or linings against which the matters are projected by the centrifugal force are provided, the said plates being removable when worn; the bottom of the casing reats on the hed-plate, and ie provided with a stuffing box at ite center, throngh which the shaft passee, and also with an opening or spout through which the pulverized mattera are discharged. The hottom of the casing has also an inner lining, whioh is removable when worn. All the joints are hermetically packed in sheepskin. The shaft is driven at the rate of ahout 500 revolntions per minnte. The essential feature of novelty in the mill is that the snbstances are projected hy the action of the centrifngal force not once only bnt repeatedly against the sides of the apparatns, the substance heing returned each time by the action of gravity in order to be again acted on, and so on. The mill consists of a series of superposed horizontal revolving discs by which the substances to he pulverized are projected against the sides of the apparatns. The said snbstences are thus acted on hy all the discs snccessively, being each time conducted hack by a fixed incline to the center of the diso next below, the operations heing repeated any nnmber of times by increasing the number of discs according to the degree of fineness reqnired.

The next invention to which reference may be made is that of Mr. E. L. Mayer, of Glasgow. It is well known that Spaniah and other pyrites of cupreous minerala contain small qnantities of cobalt and nickel, and if the bnrnt ores resulting from these minerals are subjected to the treatment called the "wet process" of extracting copper, that is, if they are roasted with common salt or other chlorides, or with sulphates, and afterwards lixiviated with water and dilute acids, and the copper precipitated from the resulting solutione hy means of metallic iron or its equivalent—the liquors—which are technically called iron solntions or waste liquors, contain small qnantities of cohalt and nickel, together with chlorides or sulphates of iron, lead, sodium, and other metals. These wsste liquors have hitherto haen mostly thrown away, and the cobalt and nickel contained therein have thns been lost. It ia a remedy for this that Mr. Mayer seeks, and his invention consists in the recovery of the cohalt and nickel and lead from these liquors, or other liqnors containing cobalt, nickel, lead, iron, copper, or any of these, hy precipitating the cohalt and nickel in the metallic state by means of zinc.

The waste liquors are heated by steam, or other heating medinm, to a temperatnre of from 50 to 100 degs. Centigrade, according to the composition of the liquor, the greater the quantity of chloride of sodium and iron in the liqnor the lower the temperature and the longer and slower the treatment throngh the ducts, and are then rnn slowly in a thin stream into shallow tanks containing scrap zinc; or preferebly through shoots or dncts made of zinc of from 50 to 200 feet in length, which enables the cohalt, nickel and lead to be precipitated upon the zinc, and when desired to maintain an eqnable temperature of the liquors the shoots or ducts may he heated. The precipitate is then taken from the scrap zinc by friction, agitation, and washing, or otherwise, as soon as the latter ie found to have ceased to act effectively upon the cobalt and nickel in the solution or weste liquor, or when zinc shoots or dncte are used, the deposit is hrushed or scraped off the surface of these at intervals of two honrs or so; or when the precipitate has attained a maximum thickness of ahout the 32d part of an inch, the shoots being made sufficiently thick to admit of this coustant corrosion and ahrasion by the metals deposited on it. This deposit is a marketahle product of considerahle value, as it contains the metallic cobalt and nickel with lead, zinc, iron, copper, and other metals, which may be separated therefrom, and the cohalt and nickel recovered hy means well known for the separating of these metals.

Considerable advantage resnlting from having facilities for thoroughly roasting and drying pulverized ores with rapidity, the invention of Mr. L. Cawell, of Hampton, New Brunswick, is worthy of attention. A hollow cylinder, consisting of a lining of fire-brick or other refractory material, contained within a shell of plate iron, is employed, or the lining may he otherwise hound so as to render the structure snhstantial and permanent. The cylinder has a cover and reste on an annnlar plate supported on columns, a central ehaft passes through the cylinder and has its upper bearing in the cover. Within the cylinder, and extending entirely across the same, are a number of circnlar stationary plates arranged at equal distances apart, these plates alternating with discs which do not extend to tbe interior of the cylinder. The diecs have central clutch-like hnbs adapted to the shaft, and the hnh of one disc is connected to the hubs of the discs above and helow by sleevee, which embrace the shaft and pass through openings in the stationary plates. The lowest disc of the series is arranged to revolve as closely as possible to the annular plate on whioh the cylinder etands, and the hnh of thia diso is clutched to a fixed collar on the ehaft, or has clutch-like projectione adapted to recessee in the hnh of a hevil wheel on the shaft, which ia driven from a horizontal shaft through the intervention of another hevil wheel. The clutch-like hnhe of the eeveral discs and the connecting sleeves form a continuous tube driven from the heviled wheel at the lower end of the eerice, and the aeries of discs ia driven from the said wheel through tbe medinm of this tube, and the central shaft is subjected to no torsional strain, ite eole purpoae being to maintain the discs in their proper lateral positions concentric with the cylinder. He prefers to make the upper surface of each diso slightly convex or inclined downwards from its center to the outer edge. On the uppermost diec rakea bear, each having arme ninged to luge on the under aide of the cover; these rakes have a tendency to move the pulverized ore to the edge of the diec, whence it falls into the flanged plate helow. This plate he prefers to make slightly concave or inclined from the edge downwards towsrds the central opening. Rakes similar to those ahove are hinged to the under side of the disc, and bearing on the plate tend to move the pulverized ore inwards towards the central opening, whence it falle into the second, and tbe ore by the movement of the discs and action of the rakes is made to pursue this zig-zag course until it reaches the lowest diec, from which it is raked into an annular ohannel, and so to the outlet opening. The pulverized ore is introduced into the cylinder through an opening in a hopper at the top of the cyliuder, the hopper heing provided with a rotating sorew which agitates the ore. Heated products of combustion from an adjacent furnace or furnaces are introduced into the cylinder, and passiug npwards in a zig-zag course meet and are brought into intimate contsct with the pulverized ore as it descends through the same course, the products of combustion finally esceping through an outlet to a proper dust chamber or chimney.—*London Mining Journal.*

The Polar Sea.

I have always believed iu the existence of an open polar sea, says Dr. Hayes in the New York *Herald*. I think I stood upon its shores in 1861. I believe thst sea is navigable, and I am utterly at a loss to understand why the *Alert* and *Discovery* did not sail upon its waters, unless we assume that the spirit which animated Baffin, Ross, Parry and the long list of Arctio heroes has died out with the advance of steam, the telegraph and home comforts. Now, please remember that this great English expedition really started where I left off. The North pole was only approched by some 80 miles nearer than I approached it. It is stated that the ice was 80 feet thick. In plain English, I don't believe it, and I don't understand how it happened that a grand expedition, fitted out with snch a great flourish of trumpets, at such enormous coet, should have got frightened after one winter, and hurried home with the old cry that the North pole can't be reached. They did not stay there long enough to prove it or tell anything abont it. To he sure, the matter of getting to the North pole is of little consequence in a business point of view. It may be of no consequence whatever, hut here is an expedition fitted out expressly to do it; has unlimited time; has every possible advantage; has the unqualified support of the British government, and yet, frightened hy one winter's experience, hurries home to report another failnre. The *Polaris* did hetter, for even after the death of poor Captain Hall, it stuck until it was crushed hy the ice. Had Captain Buddington heen imbued with the same emotions as actuated Captain Hall, I believe he could have steamed to the North pole, and I ventnre to say that, whether the *Alert* conld or could not have gone there, one year's experience was not enough to prove it.

I am a firm believer in an open polar sea. It is not a sea available for the purpose of commerce, hnt it is certainly a sea or ocean, as you may please to call it. Whatever interest attaches to it is of a purely scientifio character. To pursue science requires patience, and to go with a great government expedition, especially to make scientifio discoveries, with the distinct understanding that there is no other motive, seems to me to require something more than a simple "It can't he done." So far as getting to the North pole is concerned, I am sure it can he done, and, in failing to do it after only one year's trial, I think the Engliah expedition has shown a lamentable lack of English pluck. They say that they had a dreadful time of it; some people were frozen, and three or four of them died. That was their own fault. Traveling in the Arctic regions is not more terrihle or more dangerous than traveling anywhere elee. It is a matter of care and judgment. Accidents may happen, but it ia the duty of a commander to see that they don't happen. I believe I have made ae long a sledge journey aa any one on record. I experienced a temperature during that journey of 70 degrees helow zero, and yet there was never in all the 60 daya occnpied hy the journey so much aa a frost-hite to any of the party, and yet thia was in the exact region where the English expedition has been finding ae they say, 80 feet of ice. The *Polaris* wae in the same qnarter and got nearly as far north.

The *Polaris* met with no such ice, bnt met with the same evident demoralization. In my opinion, there is no eerions tronhle about getting to the North pole, but I don't believe it can be done in one year, and maybe not in two, and I must say, and that most emphatically, that the resnlts of thie laet of the Arctic expeditione are in no way commensnrate with ite pretensione any more than they are with its opportunities. Its like will never he seen again, and the chance for a grand achievement haa heen thrown away. In short, the whole thing is a failure without the explanatory clause. "We stnck till the last moment, and did what we could." They had food and all manner of stores for two yeara more, and ehould, in my judgment, havo elaid there unti those stores were eaten up.

In the Arctice it is generally down to 29 degrees, hut even there it does not freeze unlese the air ie entirely calm, for water in motion does not freeze. I have seen waves rolling at 50 degreee below zero, without a particle of ice in eight. The next day, when the air fell to calm, the whole sea waa covered with a cryatal mantle. The Arctic ocean is over 2,000 miles in diameter, and if anybody will once get over the land-clinging ice belt and into the middle of the Arctio eea, he might sail there to his heart's content, and I, for one, cannot see why this English expedition should so soon have abandoned the field. There are certain avenues to this great, mysterious, unknown water. There is the oft-tried Behring strait, there is Baffin hay, there is Spitzbergen sea and the Greenland sea. In this last quarter the Germans have found a new land. This land lies midway hetween Spitzbergen and Nova Zembla, which land I predicted many years ago in an address before the American geographical society. It completes the almost continuous line of land that invests the great polar basin.

In conclusion, allow me to say this great English expedition from which so much waa expected looks very like a farce. The *Pandora* was sent out to carry letters, which she left at Lyttleton island, near where I wintered in 1860-61, and, with the beat intentiona in the world, discovered the great expedition, not where it was expected to he, hnt in mid-ocean on its way home. And now, after all, the great object has not been attained. The scientifio world and the curious of all civilized nations are grievously disappointed. Bnt they are convinced that, since the British government has expended its hest efforts and spent its means to the extent of $750,000, we ehonld have some positive knowledge as to what nature is busy with about the North pole.

Georgia's Gold Mines.

Few people have any idea of the amount of gold that is dng out of the north Georgia hills and shipped to Atlanta every month. Some days ago we published a news-note in which we stated that James R. Wylie & Co., of this city, received about $3,000 a month in gold dust from that region. We learn that Messrs. Moore, Marsh & Co. receive donble as much, and that others receive fnlly that much. In fact, it pours in a yellow stream from the rich mountsins into our favored city. There are single mills at Dahlonega that get out $5,000 worth of gold per month. We do not helieve that less than $30,000 worth of gold per month reaches Atlanta from north Georgia every month; possibly $50,000.

Around Dehlonega there is a perfect nest of mills. The Hand gold mining company are running at present a 20-stamp mill; the Benning mine a 10-stamp mill; the Lawrence mine a 5-stamp mill; the Findley mine a 29-stamp mill; the Huff mine a 5 stamp mill. There we have 64 stamps in mills working witbin less than 2 miles of Dahlonega. Mr. Lombard has an 8-stamp mill, and the Ogle mill with a 5-stamp mill are within 2 or 3 miles of the other. Beeides these there are several mines in White county heing worked successfnlly. There are others in Hall county doing qnite as well. Apart from the mills there is a perfect swarm of vein workers or operators, who work deposits or veins instead of the ore. They simply wash sand and dirt iu hnge shsking-troughs, and gather the gold specks with quicksilver, which gathers every particle of the metal into an amalgam. These operationa need no mills, hut hring a very large amount of dust into market. Among others of the rich mines are notably the Ballafield, the Glade, the old Findley, the Veasey and the Jonea.

There are scores of these vein or deposit mines. The little hoys in and ahont Dahlonega spend their leisnre hours in sifting the loose soil in a panful of water, and make 30 to 70 cents a day. We were shown on yesterday a solid nugget of gold as large as the first joint of your little finger, that waa picked up by the street workers in Dahlonega, as they were grading the public road. Atlanta is the market for all these companies. They ahip a quantity of their dust here and buy their gooda here. There is hardly a day bnt that strangers pass through the city en route to the gold fields, and north Georgia will, hefore long, literally swarm with miners. We saw on yeterday several specimens of eilver ore takeu from a field near Gainceville, which sssay $76 to a ton. There were huge blocks of it picked up at random and eent to the asaayist, who upon returning the assay, made an offer of $13,300 for 30 aoree, which wae accepted. The aeaayist, Mr. Loman, of Boston, ie now preparing to forward machinery to crush the ore and win the eilver heart ont of it.—*Atlanta Constitution.*

THE BLACK HILLS TELEGRAPH.—Mr. Wm. H. Hibhard, the energetio projector and hnilder of the telegraph line now completed and in fnll operation hetween Cnster City and Fort Laramie, arrived in Deadwood yeterday. The pnrpose of his visit is to arrange for the extension of hia line to thia place, and we hope to-day that such arrangements may he effected as will seenre us telegraphic commnnication at an early date. Mr. Hibhard informs us that at an interview with General Sheridan, at which Captain Gardner wae aleo present, the General expressed himself aa anxions that the telegraph line should be completed to Deadwood, promising at the same time that if the line he completed he (the General) wonld canee a road to be hnilt immediately hetween Tongne river and Deadwood, and make the latter place the supply hase for the Tongue River post. The importance of such a tributary to our city is great, as the snppliea for over 1,200 troops will go from thie market, to say nothing of the advantage which must result from settlemeut along over 150 miles of a good thoroughfare.—*Black Hills Pioneer.*

WAXED shoe-pegs (saturated with shoemaker's wax) are claimed to make shoes that are durable, impervious to water, easy to the feet, and not liable to rip in the shank.

MECHANICAL PROGRESS.

Making Stone with Steam Hammears.

The Ciucinuati *Journal of Commerce* describes the manufacture of an artificial etone under the steam hammer, as follows: After long and weary years of close and uuinterrupted application a result hus been attained in the mauufacture of a most excellent and enduring quality of etoue which bids fair to completely revolutioniz9 the existiug state of things. By the application of the etroke of the steam hammer upou properly mixed proportious of hydraulic and commou limes, hydraulic cements, pulverized iron elsg, saud, broken stone, marble or granite, clays and minerals, inclosed in properly coustructed molds and dies, a stoue has been produced which is pronounced by the most skilled artisans and mechanical engineers superior to anything hitherto made; enduring as the Pyramids of Egypt themselves and unsurpassed in beauty and appearance by any stoue ever quarried. Eveu marble has been made by this process equal in general effect to the purest Italian and defying the best experts to tell it from the native marble itself. And this marble is made in all the different colors and variegations, with any desired design or configuration upou its surface. Any design which can be cast or cut upou iron and steel plates, no matter how elaborate or delicate, can instantaneously be reproduced in marble or stone by the use of the marvelous means employed in the manufacture thereof. Not only can the work be done thoroughly and rapidly, but blocks of auy desired size can be made, from the smallest and tiniest tiling stone to the largest and most massive blocks used in civil engineering. The time employed in making these blocks is no less marvelous than the invention itself. So quickly are they turned out that within a week to a month's time, according to the character and extent of the work, the blocks will all be ready for use in the hands of the builder. By the same method bricks of any desired quality, make, size and color, can be forthcoming, and of a finish far superior to the most perfect pressed brick now in use, and with a rapidity of production hitherto unapproached. One great peculiarity about the Phœuix stone is this, that while the grain of the stone presente the appearance of ordinary stoue, and is almost identical with it, so dense does the stoue become under the repeated and heavy blows of the steam hammer, that it loses all porosity, or porosity is reduced to the minimum, rendering it absolutely impervious to water or moisture. The absorption of water by brick is very great, as we all know, and to a greater or lesser degree this is true of all stoues, but the most repeated and prolouged tests by water fail to make any impression upon the surface of the Phœuix. This, it will be observed, is of the utmost importance, especially where stone is required under water, and whereit is subjected to the actiou of the elements, frost, etc., as well. A steam hammer with a ram of 2,500 pounds is capable of manufacturing at the rate of 100,000 brick and 10,000 feet of flagging daily.

SHEFFIELD COMING TO AMERICA.—We have formerly noted that the fact that some Sheffield steel manufacturers, finding their American business dwindling away and enormously cut down, owing to the heavy duties imposed at the United States ports, had resolved to emigrate to this country in part if not in the whole of their interest. Messrs. Sandersou Bros. & Co., of Sheffield, have issued a circular announcing a transfer of their business to the State of New York. They say: "Inasmuch as the founders of our house were the pioneers of the American trade, and were conspicuous among the earliest manufacturers of cast steel after the death of the iuventor in 1776, it seems appropriate that we should also be the first to accept the logic of events, and transfer the manufacture of English steel to America; we have, therefore, the pleasure to announce the orgauizatiou of Sanderson Bros. steel company, an American company that will continue the business of our present firm in America. The new company has taken our stocks of steel in the United States, has acquired the right to use our name, trade marke and good will, and will produce precisely the eame qualities of steel as we have hitherto done, using the eame brands of Swedish iron until American iron shall be found to equal it. The new corporation has bought what have hitherto been known as Sweet's manufacturing company's works and premises, which are situated at Syracuse, State of New York, and have already commenced operations with prospects which are of the most promising character. The capital of the corporation is $450,000, equivalent to rather over £100,000 of our currency, in portions of 4,500 shares of $100 each."

A RUSSIAN MANUFACTURER.—Demidoff is said to be the richest man in Russia, and he ie certainly more extensively engaged in industrial occupations thau any other subject of the Czar. He owns the town of Nigetalisk, in the Ural, and his 13 establiehmente cover altogether an area of about 38,000 acres. It is more particularly with iron that Mr. Demidoff deals, but he finde aleo upon his property manganeee, copper, lead, gold, diamonds, etc. At his iron works, Mr. Demidoff now producee iron in bare, platee, raile and steel to the aggregate extent of 27,000 tons per unnum. The number of workmen employed by Mr. Demidoff is about 11,000.

PREVENTION OF SMOKE.—A new iuvention, having for its object the prevention of smoke which ordinarily arises from the firing of steam furnaces, has been patented by Messrs. Thomas Ellin & Co., of the Sylvester works, Sheffield. It is upon an entirely new principle. In the front of the boiler is built a furnace, having in the interior an arch of fire-brick. The firing is done on an entirely new principle. At the front of the furnace, in three tiers, are placed slantiug bare, the end of each tier resting on a grate. In front of each of these grates is placed a shelf of iron, and it is upon these shelves that the coal is thrown. It is then thrust through a niche into the fire, where it is ignited, and as it is consumed the ashes and slag fall down the tiers of bare until they are deposited in a pan at the bottom of the furnace. The result is that the furnace is always clear of dirt and a bright fire is insured. As the coal is put in beneath the bars, the lighter gases are ignited in the fire, and the heavier ones are consumed by the heat which is radiated from the upper portion of the furnace. No matter how much coal is "put on," the whole of the smoke is consumed as fast as it is made, and were this invention adopted in all cases in the town where steam boilers are employed, not only would there be a saving in the cost of fuel, but the town would have a chance of losing its present cognomen of "the city of soot."

AMERICAN PROGRESS.—The London *Times*, of August 14th, gives prominence to a letter written by an English judge at the Centennial, who says he saw enough here to convince him that American manufacturers had been making remarkable strides during the past 20 years. Mr. Douglas Galton was a British judge in the group of railway appliances, and immediately upon his return home he penned this letter. He had previously visited this country years ago, and during the interval we all know that American manufacturing progress has been remarkable. He speaks of the great advance in our industries as shown by the growth in the amount of coal mined, and says that our higher wages, compared with England, are counter balanced by the use of machinery to an extent much exceeding that generally in use in England. Observing the substitution of steel for iron rails on our railways, he candidly remarks that the new raile are almost all made in the United States, and that it is not probable that England will be called upon much longer to supply us with rails. He goes further, and, speaking of general manufactures, says England not only can no longer expect to get a market for her manufactures in the United States, but she must be prepared to find our manufacturers competing with her in every market to which they have access.

SOFT STEEL.—The *Chemical News* gives an account of some experiments with the chrome iron alloys, in which a strange phenomenon was observed. It is well known that chromium is very hard, and scratches even hardened steel; meanwhile an alloy was obtained which was malleable, and in a fresh state could be easily bent. It was also remarked that sometimes in opening the crucibles nothing but slag was found, but in breaking the crucibles the alloy was found to be in the bottom of them—which may be attributed to the corrosive properties of the liquid alloy, as this often penetrates even through the bottoms of plumbago crucibles. The above mentioned alloy was analyzed, and the following average composition was found: Metallic iron, 96.40 per cent.; metallic chromium, 2.30 per cent.; carbon traces, lime, silica, 1.30; total, 100. By melting a mixture of cast iron, tin and lead in the following proportions a very liquid alloy is obtained, viz, 79 per cent. cast iron, 19.50 tin and 1.50 lead. This alloy is of handeome appearance and fills perfectly well the casting mol is, being thus adapted for use in the casting of small articles.

BLOWERS.—Improved blowers have, within a few years, been adopted in many smith-shops, and the leather bellows—which was once so characteristic a feature of the wagon and horseshoers' shops—is rapidly becoming a thing of the past. The modern blowers are operated by hand, foot, or very frequently by steam power, and the principal advantages which they possess over the old bellows are: first, great economy of room; second, durability; third, the production of a force-blast that can be varied according to the requirements of the work in hand; fourth, saving in fuel, owing to more perfect combustion; and, fifth, great saving in time, as the operator has a more perfect control over the fire, which can be rekindled and the heate taken in a much shorter time than is poseible with the bellows.

ACTIVITY IN CAR BUILDING.—The close of the Centennial will eo diminish travel, that for a considerable time very few new paesenger cars will be needed. With the freight equipment of the roads, however, the case is different. In order to meet the requirements of traffic, renewals muet be made in the near future on a much more extensive scale than at any time within the past three years. A large portion of the present stock is old, and has become eo battered and worn that it will shortly be unfit for service. This must be replaced by new; and it ie fair to conclude that business in the car shope will be brisk for the ensuing year.

GRUMBLING BUOYS.—Buoys have been placed in New York harbor which give out a moaning sound when rocked by the waves. They are intended to warn vessels away from shoal places in foggy weather. Under favorable conditions they can be heard three miles.

SCIENTIFIC PROGRESS.

Fruit Pollen.

Among the interesting questions by no means as yet definitely settled, says the N. Y. *Independent*, is that which refers to the immediate effect of pollen on fruits. Up to a few years ago it was thought that there was no immediate effect, and that the influence was only seen in the plante produced from the seed. But in the case of the Indian corn it is clearly proved that there is an influence direct on the seed itself. It is also thought that there is an influence on pumpkins, squashes, and other cucurbitaceous plants; but this is little more than an impression derived from cultivators, and, so far as we know, there have been no experiments directly made to test the point. There have been many curious facts placed on record that seem to be explicable on no other theory; but it is a good rule not to accept a guess in cases where direct experiment can be made. In the Indian corn the change immediately effected seems confined to the seed. The carpellary structure remains the same. If the cucurbitace, or other class of plants of a somewhat similar character, had their fruits immediately affected, it would be regarded as more remarkable than that the naked seed of corn should change. Mr. C. W. Garfield, of the Michigan agricultural college, deserves the credit of attempting direct experiments with the apple, and he believes there was a direct effect on the fruit. He made ten crosses, of ten specimens in each cross. There appears to have been ninety-seven fruit resulting. Only three kinds showed any change from the peculiarities of the female parent. In one it was the pollen of the Wagener variety on a Tallman Sweet. Unfortunately, the Tallman Sweet is known to be variable, independent of cross fertilization, so that this needs to be gone over again. If a number of trials between the two always had the same result, it would be conclusive. Another was a Tallman Sweet on a Red Astraoban. The distinct character of these apples renders the result interesting. The apples were mild, color (deep red in the female, yellow in the male) modified, and the form flat. There is no doubt of a great probability here; but it would be still well to repeat the experiment with the same two kinds another year. The other case in which change was noted was where the Wagener was the female, and the Tallman Sweet the male parent. The change was in respect to flavor and color. These are among the most interesting facts we have met with in relation to this subject. Flavor (that is, in respect to "sour or sweet"), form, and color will vary so, even in the same variety and when there is no thought of cross-fertilizing agency, that it would be safe to ask for a few more experimente before regarding the matter settled. There are other points not subject to inherent variation, that it would be as well to watch the effect of hybridization on.

The Meeting of the National Academy of Sciences.

The fall session of the National academy of sciences opened in Philadelphia on October 17th, under the presidency of Professor Joseph Henry. Professors Joel Allen, of Cambridge, George F. Barker and W. H. Gable, of Philadelphia, and E. S. Morse of Salem, and General John Newton, were elected members. Professor J. E. Hilgard read an essay on the variations in the standard bars to which all measures are now referred in France, England and in this country. He had compared the iron bars sent to the United States as duplicates of the English bronze bar, and found a variation of 0.00034 inch, which is not an admissible error. Professor Hilgard believes that the bronze and not the iron has changed, and that the alteration is due to one of the metals in the alloy being in a state of tension when the standard was made. In making the platinum standard meter in Paris recently, the metal was remelted and worked over nearly 200 times. The duplicate standards, made of cast steel, for this country, are correct to the .0001 of an inch, and differ from each other by less than .00001 of an inch.

Dr. J. L. Leconte read a paper on the hydrocephalus, an insect which resembles a fat mole cricket, and of which there is a specimen in the Brazilian Centennial exhibit. He considered that a careful study of existing insect life will do more to demonstrate the course of development than all that can be accomplished by means of fossils, owing to the fact that insects have kept such forms as they have now, with comparatively slight change, during many ages. The hydrocephalus is especially of service as a missing link between such relatione.

THE POSITION OF SCIENCE IN MODERN LIFE.—In the opening address, the president of the French association for the advancement of science said: Natural science is no longer content with the contemplative attitude which sufficed for Newton and Laplace. Science is now mixed up with all the personal acts of our existence; she interferes in all measures of public interest; industry owes to her its immense prosperity; agriculture is regenerated under her fostering care; commerce is forced to take her discoveries into account; the art of war has been transformed by her; politics is bound to admit her into its councils for the government of states. How could it be otherwise? Have not mechanics, physics, chemistry, the natural sciences, become intelligent and necessary agents for the creation of wealth by labor? If comfort is more universal, the life of man more prolonged, wealth better distributed, houses more commodious, furniture and clothing cheaper, the soldier better armed, the finances of the state more prosperous, is it not to the sciences that all this progress is due? Whether we wish it or not, we must needs accept science as a companion to possess her or to be possessed by her. If you are ignorant, you are her slave; if you are skilled, she obeys you. The future belongs to science; unhappy are they who shut their eyes to this truth.

Purification of Metals by Filtration.

Prof. Lampadius, of Freiberg, concluded that at a certain low temperature of fusion the metallic impurities present in the more easily fusible of metals would separate, partially as such, and partially as definite crystalline compounds, and float in the fused mass, from which they could be removed by filtraton. Experiments by him in this direction were so far successful that the expected definite compounds were found upon the filter, but the metallic filtrate was still very impure. The filter was made of quartz sand, slag, etc., which was not wet by the molten metal. Carter, however, according to a communication by him, in trying to adapt this principle to the purification of Bohemian tin, on a commercial scale, sought for material for a filter, which would be wet by the metal to be purified without being dissolved in it. Iron, with its comparatively high temperature of fusion, and its adhesion for tin, as manifested in the tinning of iron, was employed for the filter. Five hundred strips of tinned iron, as thin as paper, about six-tenths of an inch long, and one-fourth as broad, were packed tightly in a square iron frame by the aid of wedges, and the frame was then luted into a suitable opening in the bottom of a graphite crucible. The tin, melted in a second crucible, was allowed to cool until the separation of fine crystals on the surface was noticed, and the thickening metallic mass was then poured into the filtering crucible, when the still fluid pure metal passed through, and a pasty magna was left in which iron, arsenic and copper, concentrated to a great degree, were found combined with tin, while the filtered tin proved to be almost chemically pure. Fifty hundred weight were purified in the crucible described. Other forms and other materials for filters are suggested, and other possible application of the method, as in the separation of silver from lead containing the former metal.

Electro-Magnetic Experiment.

EDITORS PRESS:—I fancy that I have found something new in electro-magnetic force, for I do not know what else to call it. I was polishing a glass door for a small cabinet. It lay on a table where were scraps of paper, leather and nut shells. I was rubbing the glass with a piece of sheep skin, tanned white. Soon I noticed that all the particles began to hop about, as though endowed with life, and would adhere to the glass. I then put under larger pieces of paper, cut in various forms, and they would whirl and hop, etc. I noticed that the grain side of the leather was positive. As I was rubbing the glass with that side, everything was in motion, and so rubbing the glass with the other side, the particles and paper would drop down and lie quietly. The glass lies to lie in a frame, puttied in. My glass is 17 by 24 inches; the larger the glass the stronger the magnetic force. I would like to have you make the experiment, as it is a nice parlor amusement, and give us an idea of what you think about it, through the columne of your paper, and thus oblige a subscriber. —OLIVER LEPPER, Dutch Flat, Cal.

Our correspondent's discovery is nothing new; it is only one of a hundred exhibitions which can be made of electricity as excited by friction. The kind of electricity developed in a body has long been known to depend not only upon the nature of the body, but the nature of the body with which it is rubbed. The kind of excitement is also affected by the direction of the rubbing, as is shown by rubbing silk ribbons cross and lengthwise. The color of the body has also been found to affect the kind of excitement. The experiment our correspondent describes is, as he says, a nice parlor amusement, but there is nothing about it which has not been described before.

THE WINDINGS OF RIVERS.—Prof. James Thompson, at the meeting of the British association, exhibited a model to illustrate the action of rivers in modifying the forme of their windings. He said that most treatises on hydraulice speak of this action as if water consisted of particles impinging against the outer side of the bend, and so wearing it away. This is objectionable, as water does not impinge but presses against the outer bank. The action is more properly as follows: The stream lines of water flow less rapidly from the center to the outer, and more rapidly from the center to the inner side. In consequence of this and fluid friction, there is a flow of water at the surface from the inner to the outer side, and below from the outer to the inner. This causes the earth at the outer side to be transferred along the bottom to the inner bank. He illustrated these remarks by the behavior of threads attached to pins stuck in at different parts of the bend of the model river. The bottom threads inclined towards the inner side, while the upper threads inclined slightly towards the outer. The actual state of matters could also be seen from the mud raised by the flow of the stream in the model.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

AMADOR.

Clean-Up.—Amador *Ledger*, Nov. 11: A clean-up of about 15 tons of rock from the Griesback mine, crushed at Mace's mill, above Volcano, realized about $1,200. The rock was considered only of second grade quality. The mines in the northeastern portion of the county continue in a flourishing condition.

The Olive Mine.—This is a promising claim at Drytown, owned by C. Nickerson and seven other gentlemen. Several men are engaged in developing it. A ledge of rich rock has been uncovered, and the indications are favorable for a permanent and valuable mine.

The Volunteer Mine.—Amador *Dispatch*, Nov. 11: We understand that a company from San Francisco have taken charge of the Volunteer mine, near this place, and that the work of thoroughly developing it will soon be commenced. The lumber and machinery have already been ordered for the putting up of substantial hoisting works. Mr. Stephen Kendall, who is well known as a practical miner, will, we believe, have the superintendency of the works, and he informs us that it will not be long until we can know whether the mine is a valuable one or not. The prospects so far have been good. We hope the company will realize their highest expectations.

BUTTE.

Lava Beds.—Oroville *Mercury*, Nov. 11: During the past summer quite a large number of Chinamen have been at work mining in the lava beds below town, with a considerable degree of success. Some companies have taken out a great deal of gold and made very good pay, while others have barely made expenses, and still others have completely failed to make enough even to pay for provisions. Probably not more, on an average, than $20,000 per month has been taken out, though some months a much larger sum has rewarded their labors. A few days before the late rain we visited about every part of the lava beds. Acres upon acres of earth are upturned. Long lanes that have been mined out show the direction of the pay streaks of dirt. In every direction were to be seen columns of smoke rising from steam engines used by the different companies to keep the water out of their claims. On visiting the mines a few days after the rain we saw a number of the engines idle and the mines full of water. The Chinamen dread to mine where there is the least danger. The saving of a bank, whether he is injured or not, puts a stop to his work. Fire and water he will not contend with. During the coming winter but little will be done, and most of the Chinamen will scatter away to the mountain works and ravines to mine until spring, when they will return to engage in the work anew.

CALAVERAS.

The Emerson Hydraulic.—Calaveras *Chronicle*, Nov. 11: Piping has not been resumed in the Happy Valley hydraulic since the great clean-up lately made, it being the intention of the proprietor to facilitate the working of the mine before commencing washing again. The bedrock tunnel, through which the flume is laid, is to be extended 100 feet further, bringing it close up to the gravel bank, and the flume is to be considerably lengthened before any more piping will be done. The contemplated work will probably consume about three weeks' time; then look out for a succession of clean-ups that will make even the denizens of the richest mining section in the world stare. We tell you, now.

Progress at the Calenco Consolidated.—The transverse drain tunnel of the Glencoe Consolidated reached the west vein last week. Five feet of vein matter and a streak of solid ore one foot thick have been cut through, which all contains gold. The tunnel will cut the west fissure 50 feet farther. A test lot of ore from the central portion of the west vein, 10 tons and 200 pounds, paid a fraction over $22 per ton.

EL DORADO.

The St. Lawrence Bonanza.—*Mountain Democrat*, Nov. 11: Reports from the St Lawrence mine are of the most flattering character. One ounce of gold was taken out last Saturday which would yield at least $1,000. Superintendent Rosewarn is in high spirits and promises a $40,000 crushing before the end of the year.

INYO.

The Mines.—Inyo *Independent*, Nov. 11: The Eclipse mill has been running steadily and successfully for a number of weeks, or ever since steam was introduced in the pans. Both the Kearsarge and Rex Montis mills are yet steadily at work, and turning out bullion at a most encouraging rate. The probabilities are, however, that both of the last named will soon have to suspend operations on account of the weather interfering in getting ore down from the great altitude of the mines, particularly of the Rex Montis. A friend of ours, in whose judgment we place great reliance, and who speaks from a disinterested standpoint, says the last named mine is truly the most promising one in all this region so far as his personal knowledge (which is not limited) extends. Regarding the others here referred to we have nothing new or definite with respect to their developments, but believe them to be entirely satisfactory. All of them are shipping bullion, as will be noted in another item.

The Rex Montis.—This mine is likely hereafter to be the subject of frequent reference among mining men throughout the country, and therefore a word in reference to its locality and history will bear repetition. It is situated on the north side of Kearsarge peak, 12 miles by the road west of this place, but in an air line apparently not half that distance away. Its altitude is something near 10,000 feet, or nearly 6,000 above that of this place. It was discovered and located in 1865, by the irrepressible Jimmy Sharp, Jim Wall, Scott Broder and G. W. Brady, with which party John R. Hughes, not of Cerro Gordo, held an equal interest. Two years since it was leased to Jack Curtis and others, and while under this lease attracted the attention of Mr. J. H. Holt, the present manager and a stockholder in the Rex Montis incorporation. Mr. Holt bonded it over the lease and last year took out enough ore to satisfy himself that it was a mine well worth attention. During this time Scott Broder deeded his interest to Mr. Holt. A short time since he completed the purchase, buying out the remaining four of the original owners, the purchase money to the amount of $4,000 each being paid over this past week. The company was duly incorporated last spring. Since then, Mr. Holt has pushed work continuously, and has proved it to be really a most valuable mine. The first lot of ores from the Rex Montis was about six weeks ago reduced in the Kearsarge mill, yielding handsomely; since then that work has been carried on in the old Silver Sprout mill, which the company purchased conditionally and refitted so as to do excellent work.

Bullion Shipments.—Bullion shipments through Wells, Fargo & Co.'s office at Harris & Rhine's, to the amount of $10,525 were made in the past few days, in lots from different mines as follows: Lida Valley, $600; Kearsarge, $2,300; Eclipse, $2,000; Rex Montis, $5,600; one parcel, $25; total, $10,525.

NEVADA.

Allison Ranch.—Cor. Nevada *Transcript*, Nov. 11: The mining prospects in this district are improving, and the times promise to be as lively as in the palmy days from '56 to '66. The Franklin is still turning out plenty of quartz of good quality. They are running two drifts, and the ledge in both is looking well. The work of sinking the shaft is still progressing, and a ledge two feet wide makes the owners feel confident it will soon be the most valuable quartz mine in Nevada county. The crushing mill is erected with ten stamps, and ten more are soon to be put up. Martin Ford, the Superintendent, is rushing things, so there will be nothing wanting when winter sets in. The Homeward Bound company have met with encouragement in the shape of a good ledge. The crew working here is small, on account of there being no room for more. A number of men have been discharged at the Omaha mine during the last week. This has proved itself to be rich, with the prospect of a continuance. The old Larimer crushing mill, now leased by Joe Southron, is constantly working. Joe gives good satisfaction to customers, and gets plenty of rock to run steady.

The Washington Bayou is a failure. The Colbert mining company have been prospecting the mine for nearly two years, and now will abandon it. The Alaska company have put up a mill and machinery where the John Bright stood. The John Bright was worked by several parties, but would not pay any more than expenses. The company now owning it will spare neither money nor trouble to open the mine, and work it to the best advantage. The Pennsylvania mine has failed to meet the expectations of the owners. The rock reduced by the Fryer process was a failure.

Every person here is seized with a mania to own a quartz ledge, consequently every piece of ground is claimed, and nearly every ledge is being prospected. It is believed there are claims here which, if developed, would rival any mine in the county. From Grass Valley to Forest Springs, on both sides of Wolf creek, miners are at work. Some have met with encouragement while others are working with the expectation of obtaining good results. The richest quartz mines in Nevada county are situated on the above mentioned creek, and persons think that if they find a ledge near Wolf creek they are on the road to fortune. We have had failures and successes as well as every mining district, but now they are forgotten, as there is plenty of work for men and good times ahead.

Champion.—*Foothill Tidings*, Nov. 11: This is the name of a mine likely to come into prominent notice ere long if reports from there be true. It is an extension of the Providence mine and the Ural, over on Deer creek, and the developments recently made are a ledge from four to six feet thick, showing gold and giving promise of a rich and permanent pay shute. The company, consisting of Messrs. J. F. Schuitess, H. Vogelmen, C. C. Townsend, D. Binkelman, Geo. C. King, and perhaps others of this place, are about to incorporate and proceed to open up the mine in good shape.

PLACER.

A Bonanza.—Dutch Flat *Forum*, Nov. 11: J. A. Stone, Superintendent of the Gold Run hydraulic mining company, limited, visited this place last week and reports the striking a bonanza in that mine. He exhibited to us $22 of coarse gold, the result of one pan of gravel taken from a powder drift they were then running, and that it was not any more than an average of richness of considerable ground they had prospected recently. Having with him also several large nuggets taken from a prospect shaft sunk 60 feet from this powder drift, the gravel in which yielded $12 to the pan. They are busy at present putting in flumes, raising inclines and running powder drifts, and will be ready to commence washing in three weeks if water can be had. Mr. Stone is confident that during the next year their company will pay the largest dividends ever received from any gravel mine in this part of the country.

Mining Items.—The fine weather of the past week has enabled the several mines to be rapidly put in shape. Elmore Hill commenced washing Monday. Central continues washing. The Southern Cross, which, in our last issue, we stated was plugged in the incline, started up washing again Wednesday, and is now retarded only by the immense boulders rolling into the ground sluicee. Baker claim is now rigged, and it will be ready to turn on water in a few days. The Miners' ditch company's claims, at Gold Run, are now nearly ready for water. The South Yuba canal company has about 1,500 inches to sell, but the various claims that purchase water of it are not yet ready to use it.

Bar River Mines.—The Centennial mine is being worked steadily with good results. Our informant, one of the owners, states that the last car of dirt taken out of this mine was washed separate and yielded $5, thus showing the ground to be very rich. On the Dom Pedro a contract has been let to run a tunnel through the bedrock into the hill, and the work is progressing.

Shady Run Mines.—The Wild Yankee claim has ceased drifting for the season and is now making preparations for hydraulicing, which will take about one week to complete. J. Brink sold his one-third interest in this mine, on the 8th inst., to Charles Wedgewood, one of the old shareholders. The air in the North American mine being improved, there is now a large force of men at work drifting and washing.

Remington Hill Mines.—The Rhode Island claim is owned by Knight Bros., who work their tract of mining ground according to the different seasons of the year. In the spring, when water is plenty, they work their deep hydraulic diggings; in summer, when the supply of water is short, they ground sluice; and in winter, when the snow is deep and the weather cold, they work drift diggings, found in old river beds, for which this part of the country is noted. By working in this manner for a number of years, the Knight Bros. are now classed among the solid miners of this county, being able to respond with a few thousand when necessary. Although very little is known of the Wide West mine as yet, the prospects have been so encouraging that the owners are now running an extensive tunnel, through which to work drift diggings the coming winter.

St. Patrick Mining Company.—Placer *Argus*, Nov. 11: This company is pushing the rebuilding of its mill with great energy. The contractor began work three weeks ago, and now has the building up and enclosed. Two weeks more will have it ready for operation, and we may confidently expect a profitable run during the month of November. The mill is commodious and well constructed, and contains all the latest improvements in mining machinery. It is 86 feet long and 38 feet wide, and put up in a most substantial manner. There are three batteries of five stamps each, the stamps weighing 700 pounds. There are six concentrators and four pans. The contract price for the mill is $15,750, but extras will swell the cost to about $17,000. The power will be supplied by a Knight water wheel, run by something over 100 inches of water under a pressure of about 160 feet. The mine itself is looking well. The shaft is down 576 feet, and is still sinking. The intention is to sink to the 620-ft level, when drifting will begin. An additional force of men will be employed next week, and in a short time we may expect operations to be fully resumed.

PLUMAS.

Spanish Ranch.—Plumas *National*, Nov. 4: On Monday last we made a flying trip to Spanish Ranch, and found the little burg quiet as usual, but showing strong indications of prosperity. Messrs. Thompson & Kellogg have one of the best business stands in the county, being, as it is, the center of a large and prosperous mining district. Their capacious warehouse is filled to the roof with all kinds of goods suited to their trade, and "Uncle Dick" informed us that their freight was all in with the exception of two loads. The store is also full, and the gentlemanly clerk, Mr. N. K. Wright, seemed busy as a bee in attending to the wants of customers. Mr. Kellogg was hard at it in the blacksmith shop, and the miners up that way seem to think his work the best in the world. The Ranch is conducted on strictly temperate principles now-a-days, no liquor being sold there. We hope the owners will continue in the prosperity which they at present enjoy.

Foorman's Creek Claims Sold.—Henley & Lanthier, of Foorman's creek, sold out their mining claims to a Boston company last week for the sum of $7,000 in gold coin. Mr. J. H. Thomas, of La Porte, acted as agent for the company. From the fact that these claims paid richly last spring, we should judge that the Boston company had made "a good buy."

SONOMA.

Local Mining News.—*Russian River Flag*: A. Phelps returned last Saturday from the Mt. Jackson mine, where he has been for some time engaged in putting up machinery for the Mt. Jackson company. As has been stated in a previous issue, this company has three ten-ton Eames furnaces completed and in working order; finding, however, that more crushing capacity was required, Mr. Phelps was engaged to attend to the matter. One week ago last Saturday he completed a new machine and put it to work, and when he left about 30 flasks of mercury had been stored up. The new crusher will prepare for the furnaces 30 tons every 24 hours; that is, one day will crush ore enough to supply all the furnaces for the 24 hours which they run. The Great Eastern mine, adjoining the Jackson, keeps a 10-ton Eames fired up night and day. Both mines possess leads of hard and soft cinnabar; the former is of a much higher grade, but is so situated that water has thus far prevented its tapping. The Jackson company, however, are now contemplating the running of a tunnel, which will drain the lead and afford easy egress of ore. When this is done, the already paying mine will become a very rich one. There is a good prospect that the Eames furnace will greatly revive quicksilver mining in this section. Its working at the Jackson and Eastern mines has demonstrated that it is far superior to any furnace yet known for working refractory ores. As an indication of the extremely low grade ore that it will work, Mr. Esmes has offered to put up furnaces for companies owning leads of two per cent. rock and accepting ahores in part payment. He claims that it will also extract the "native" without difficulty, which it seems to us will yet render some of the already located "native" leads fabulously valuable. Superintendent Bacon, of the Bacon mine, Pine Flat district, visited Mr. Esmes at the Jackson mine about five weeks ago, and it is understood negotiations are pending for the erection of Eames furnaces at his mine. The tools and other personal property belonging to the Excelsior quicksilver mining company were sold by the sheriff at the mine on Monday, to satisfy a judgment in favor of Joseph Jones for $150. There has been no work done at the Excelsior for some weeks.

Nevada.

WASHOE DISTRICT.

North Con. Virginia.—Gold Hill *News*, Nov. 15: A large air compressor has been added to the machinery and is now ready for use. The hoisting machinery has just been given a good overhauling and put in the best of condition for winter use. The blacksmith and carpenter shops have both been greatly enlarged and prepared for more extended operations.

Rock Island.—The old pumps and rods are being taken out and their places supplied with large 14-inch pumps. This has been made necessary by the strong flow of water recently struck on the 850-ft level. It has not been decided yet as to whether the engine will have to be replaced with a larger and more powerful one or not. The prospects of the 850 ft level, when the flow of water was struck, was better than anything ever before found in the mine.

Yellow Jacket.—The north drift at the 1940-ft level will make connection with the drift south from the Imperial within a week, after which cross-cutting the ledge from that level will be commenced. On the 2040-ft level the south drift is being pushed forward for a connection with the south winze from the 1940-ft level. The shaft is 60 feet deep and timbered throughout.

Ophir.—There is no material change in any of the ore breasts in any portion of the mine during the week. Everything is looking well at all points, and all the mill will be running again in a very short time. The north drift on the 1700-ft level is steadily advancing, the face in very favorable ground.

Crown Point.—The extraction of ore has been entirely suspended for the present. The grade of ore was too low to pay the expense of extraction and cost of reduction. As a matter of course the Rhode Island mill will have also to stop. Sinking the main incline shaft, below the 1800-ft level, is making better progress than it has for some time past.

Silver Hill.—The troubles caused by the loosening of the fly-wheel of the pumping engine, last week, have been overcome, and the water at the bottom of the main incline has been extracted and the sinking resumed. The main east drift on the 650-ft level is being again driven ahead at the rate of six feet per day. The north drift on the 444-ft level is in a distance of 785 feet, the face in good running ground.

Superior.—The drift or tunnel from the ravine to connect with and drain the shaft is now in 128 feet, and has to go about 150 feet further to reach the shaft. It will intersect the shaft about 30 feet below the bottom of it, when a connection can easily be made by an upraise.

Belcher.—Daily yield 250 tons of ore. The ore breasts show no change, and the character of the ore is still low-grade, though paying well for milling and extraction. Sinking the main shaft is going ahead rapidly. Sinking main incline shaft at the old works is also making good headway.

Kossuth.—Two new cross-cuts have been run on the 350-ft level during the past few weeks that have developed some fine ore. The west drift on the 600-ft level is now in 63 feet, and must without doubt soon strike the ore vein.

Hale & Norcross.—The water has been lowered 27 feet during the past week. The pumps are doing splendid work, and it now begins to look as if it would not take more than 30 days more to reach the bottom and enable the resumption of work on the lowest levels.

Cosmopolitan.—The drifts both north and south from the bottom of the winze below the tunnel are being pushed ahead, following the vein. The south drift continues in excellent ore, but the north drift is not showing quite so well at present.

Monumental.—Preparations have been completed for starting up work on this mine again in a very few days. The shaft is situated about 700 feet southeast of the Woodville, and is down 180 feet.

Mexican.—The face of the west drift on the 1465-ft level is in clay-quartz, carrying some favorable spots of ore. The upraise from the same level is still showing well and is making good progress. The west drift on the 1300-ft level is making rapid headway, without material change to report.

Con. Virginia.—Daily yield, 450 tons of ore. The ore breasts at all points in the mine are yielding the usual amount of rich ore, and look as promising for the future as ever. The Brunswick mill, which was shut down for repairs, was again started up on Monday last, and along with all the rest is crushing ore to its full capacity. The large blower at the 1500-ft level, placed there to furnish air for the drifts and crosscuts on the 1700-ft level, is a complete success, and must greatly aid the development of that portion of the mine. The damage done by the water-burst on the 1400-ft level is nearly all repaired. The mine has not been in better condition for many months past than it is at present. The connecting drifts with the ore body on the 1500-ft level to the southward are all being put in good working condition again. The new side track of the railroad is finished to the C. & C. shaft, and the splendid large ore house below the shaft is completed. As soon as the west drift on the 1650-ft level of the O. & O. shaft reaches the vein, the extraction and shipment of ore can be commenced.

California.—Daily yield, 450 tons of ore. The ore breasts in every portion of the mine were never looking better or yielding richer ores. The ore breasts on the 1500-ft level are still extending to the eastward, tha ore being of the same uniformly rich character. The south drift on the 1600-ft level has now penetrated a distance of 200 feet south from cross-cut No. 5, the entire distance in good ore. In the face of this drift the ore has shown great improvement in the past few days, being at this time of a very rich quality. The main west drift at the 1650-ft level of the C. & C. shaft is being pushed ahead at the rapid rate of 10 feet per day. It is now in a distance of 270 feet, and will have over 250 feet yet to run to cut the ore vein. The station at the 1650-ft level is being enlarged and put in condition for big runs of ore when the ledge is reached. The new pump tank in the shaft below this level is fast approaching completion. The flow of water at the bottom is unchanged, and keeps the pump running at the rate of six strokes per minute.

Justice.—Daily yield, 230 tons of ore. The ore stopes on the 400, 500, 600 and 700-ft levels are yielding well and look more promising now than they have at any time in the past. A drift north is being run on the 600-ft level, which is opening up splendid ore. Both the north and south drifts on the ore vein on the 700-ft level are also developing fine bodies of good ore. The winze sinking below the 700-ft level is making good progress, the bottom still being in rich ore. The northeast drift on the 1000-ft level is steadily advancing, with very encouraging prospects. Several stringers of good ore have been cut by this drift during the week, some of which were from eight to 12 inches in thickness and quite rich.

Utah.—Sinking the main shaft is going ahead finely, the bottom in good blasting ground. The flow of water is now well caught up at the tank stations in the shaft, so that it gives little or no bother whatever in sinking. A station has been opened at the 950-ft level and a drift started to cut the ledge at that point. This drift will open the ore vein at a depth of 450 feet below where the last level was prospected, and will therefore have that extent of entirely unprospected virgin ground to prove.

Bullion.—The east cross-cut from the north drift on the 1400-ft level is developing some fine quartz, with every indication of soon reaching the main ore vein. The south drift on the 1500-ft level to connect with the main incline for air purposes is fast approaching completion.

Imperial Con.—Sinking the north winze below the 2,100-ft level is going rapidly forward, the bottom showing some fine quartz and ore.

Gould & Curry.—The great heat created by the flow of water from the Con. Virginia entirely stopped the work at the 1700-ft level during the first two days of the week. The water, however, ceasing its flow, work is again resumed at all points. The water is entirely drained and the drifts are being put in good working condition as rapidly as possible.

Sierra Nevada.—The north and south prospecting drifts, at the first, second and third station levels, are all steadily advancing at a fair rate of speed. On both the second and third levels the drifts going north are showing much more encouraging prospects than for some time past.

New York.—Three sets of men are employed at three different points in the shaft, raising up on the third compartment. This third compartment is designed for a pump shaft. The pumping engine is already erected and is one of the finest in the State.

Baltimore and American Flat.—The winze on the ore vein in the east cross-cut on the 1050-ft level is down 50 feet, the ore in the bottom beginning to widen and being of a much richer quality than where it was first struck on the 1050-ft level. The upraise above the level is also showing some good ore.

Julia.—The face of the main south drift on the 1600-ft level has shown a great change in the past three or four days. The entire face of the drift is in soft clay mixed with quartz, with every indication of paying ore. The face shows some signs of water, but every precaution has been taken to receive it should a body be tapped.

Caledonia.—A strong flow of water was encountered in the bottom of the shaft four or five days ago. The flow was so strong that sinking the shaft had to be suspended for the time being. The pumps are kept running at their full capacities, but the water yet continues too strong to admit of a resumption of the sinking.

Succor.—The old pumps and columns are being taken out of the shaft, preparatory to putting in the new. The erection of the pumping engine is making steady headway.

Trojan.—Very good ore developments are being made in the northwest drift at the 300-ft level, both by the east and west cross-cuts. Whenever ready, a large amount of good ore can be extracted with the utmost facility. The upraise is 85 feet above the track floor, and a drift is being run to connect with the shaft for air circulation purposes.

Herald.—The excellent ore at the bottom of the main incline still continues, with the most favorable prospects of large and extensive development. The main incline is now down 190 feet. Superintendent W. H. Broadhead has gone below to contract for hoisting machinery.

South Comstock.—The drift east from the 300 ft station is being pushed ahead as fast as possible, but the rock in the face of the drift is exceedingly hard and tough.

Lady Washington.—The east drift cross-cutting for the ledge at the 850-ft level is in 105 feet to-day, with the face in ledge porphyry. No water at present; drift dry and hot.

Prospect.—Drift west from the shaft, at the 400-ft level, is in 110 feet. Material in face, hard porphyry, with occasional good streaks of quartz coming in.

Dayton.—Two new cross-cuts have been started from the north drift on the 700-ft level. The prospects of the ledge on both the 500 and 600-ft levels are showing a steady improvement.

Ward.—The shaft is down 720 feet, the bottom in good blasting ground, and sinking progressing at the rate of 25 feet per week. The water no longer gives the least trouble.

Chollar-Potosi.—Sinking the main incline below the 1600-ft level is progressing at the rate of two and a half feet per day. Sinking the combination shaft is also making excellent progress.

Cabinet.—Work was resumed in this valuable mine on the first of the present month. The old shaft is being enlarged to three compartments.

Union Con.—The west cross-cut from the main north drift on the 1300-ft level is still showing some quartz and low grade ore.

Buckeye.—The north drift on the 550-ft level is being pushed ahead with all possible vigor to reach the rich chimney of ore known to extend downward from the 300-ft level, at a point about 600 feet north of the shaft.

West Belcher.—The extraction of ore from the various openings of the 300-ft level will be commenced shortly, full arrangements having been made to that effect.

Aurelia and Argentina.—The new shaft is down 98 feet to-day, and work progressing well. The material at the bottom is porphyry and quartz, with occasional small bunches of low-grade ore. The rock is hard, but blasts well.

Sutro Tunnel.—Total length of tunnel, 14,970 feet. Material hard, tough-working porphyry, with occasional streaks of quartz, carrying considerable pyrites of iron which give good gold assays.

Pontiac.—The developments in this mine are still confined to the cross-drift through the croppings of the ledge. This drift is showing some good ore.

North Carson.—Bottom of shaft in very hard rock at present, with seams or feeders of rich ore.

Phil. Sheridan.—Sinking the shaft is being urged ahead at a very rapid rate of speed. The bottom is

Continued on Page 341.

The Engineer.

The New York and Brooklyn Bridge.

The first permanent wire of the Brooklyn bridge, over tha East river, connecting New York and Brooklyn, wss thrown across on the 22d of September. The travelers are wire ropes of three-fourths of an inch, whila the csrrier is a cable of one and three-fonrths in diameter and weighs 21,000 pounds. Seven years ago —that is, in October, 1869—work was begnu on the foundations, piers, anchorages and approsches of this great work; and that being finished, the snperstructure of bridge proper is commenced. As the connection of the 1,000,000 city of New York with the 450,000 city of Brooklyu is a matter of some importance to the former and of very grest importance to the lattar, let us, says the *American Manufacturer*, take a glance at what the proposed bridge is to be, what it is to cost and how it came to be built. A granite tower rises on esch bank of ths rivar, and behind each—farther up town on both sides—is an anchoraga, from which an approach lsvels the track down to the city grades. The following figures are feet measnrements of the bridge: Lengch of river spsn, 1,595; Length of New York land span, 1,870; Length of Brooklyn land span, 935; Length of New York approach, 1,562; Length of Brooklyn approach, 971. Total lengih, 6,933.

The towers npon the two hanks measure, in feet also, as follows: Below high water, 78; from high water to roadway, 135; above roadway, 149. Total hight of towers, 462.

The width of the roadway with its five tracks is msde up as follows: Two carriage roads, 18 each, 36; two car traoks, 13 esch, 26; promenade for foot pssscngers, 15; divisions, 8. Total width of rosdway, 85.

The main snpporters of this immense work sre four wire cables of steel, something over 3,600 feet in length and some 15 inchee in dismeter. These are to be streiched from anchorage to snchorage. They will be wrought in position. Esch is to consist of some 6,000 separate wires, two of which will be laid at a time. Tha two cables are to be made into an andless chain, which will be driven by au engine on ths Brooklyn side. The wires of the grand cables mnst he clasped together, and for this purpose a temporary bridge mnst be built all the way across. This will he the next work now. Two other 1.75 inch cables will be thrown aoross on the upper side, and thus the other two grand cables will go on at nearly the same time with the first two—all four at the ssme time, that is to say. The wire to be used in these grand cables ie what is known in the trade as No. 7 galvsnized steel wire, about 1.6 inches in diameter. Each grand cabla is to consist of 19 strands, and when these are clamped iuto a round form the whole will be wound spirslly with No. 10 wire, so closely pressed as to be water-tight, the whole being saturated with psint during the process of constrnction. It is expected that two months will be sufficient time to oomplete the temporary cables, and then will begin the work on the grand cables. The time of this preparatory work depends very much npon the westher, as littla csn be done during high wiuds and nothing during fogs. Tha expense of the work thus far has been $6,758,611.12.

Shortest Line Acaoss the Isthmus.—Resr-Admiral Cochrane has written to tha London *Standard* snggesting that it would be to the interest of England if steps were tsken for snrveying a ronte for a cansl which is traced by proceeding np the Bayano river, which debouches into the Psoifio abont 20 miles to the eastward of Panama, to a farm or village oslled Jesus Maria; from thence in a more or less direct line, to proceed to the hsrbor of San Blas, on the Atlantic. The map, "Selfridge's," and Admiralty chart, demoustrates at a glsnce the advantages of adopting this route on acconnt of its shortness, if it is fonnd on survey to he otherwise suitsble. The conrse he recommends for survey is the shortest across the Isthmus of Panama, viz., about 29 miles. He states that he ascended the Bayano river in May last, with two steam pinnaces, to Jesus Maria, in three snd one-half houre of steaming, and oarried a depth, excepting over some sand hars, of several fathoms. There he caused to be obtained observations for latitude and longitude, which showed that he had sttained within 19 miles, in a direct line, of the port of San Blas, on the Atlantic, and the tidal rise of the Pacific extended several miles beyond the point attained by him.

The Tallest Lighthouse in the World.—The firm of Cail & Co. have begun the constrnction of the great lighthonse which is to stand on the brow of the Trocadero, in Paris, during the great exhibition of 1878. The lighthonse in the 1867 exhibition was only 53 metars (about 180 feet) high, wharess the present one will reach 127 meters, or 413 feat, in hight. Tha lighthouse hae been ordered for Plymouth, and its white and red lights will be seen 7 leagnes on the main. It will contain 10 roome for attendante, 2 provision bunkere, an infirmary and a bedroom with 10 bads for the shipwrecked. Abont 50 metere (162 feet) abova the level of the sea a movable annular plate ie provided, carrying a big cannon for shooting the salvage line within a range of 8,000 to 10,000 maters. Naar the base of this gigantio pharoe there ie a completa and improved lifehoat arrangemant, which allows of a lifaboat baing lowered by oua man.

Roofs of Enormous Width.—The desire to construct the largest single roof in the world wss achieved in the roof of the Midland railway station at St. Pancras, which now possesses that distinction, having eclipsed the roof of the Imperial riding school of Moscow by a few feet, the span of the former being 240 feet, and that of the latter 235 feet. Bnt, apart from ambitious motives, the principal reason for adopting these large single spans is, that it obviates the necessity for columns or other intermediate supports which hamper the station arrangements and interfere with alterations, should they become necessary. The most recent examples of large spsn roofs are to be found at Glasgow and Manchester, both of which are in conrse of construction. The Glasgow roof is to cover the large new station at St. Enoch sqnare for the Glasgow Union railway, and which is to be used by the Glasgow and Southwestern and Midland railwaye. This roof, which is well advanced towards completion, is of the same general character as that of the Midlsnd railwsy, already referred to. It is, however, smaller, the Glasgow roof having a spsn of 198 feet and a lengih of 518 feet, as against a span of 240 feet snd a length of 689 feet in the Midland roof. The new roof will be 90 feet high from platform level, and will be supported by 15 msin ribs, 12 of which are alresdy erected in plsce, and the ironwork for the remsining three is being sent forward. The total weight of the ironwork in this roof is about 1,400 tons. The roof at Manchester is for the new joint ststion of the Midland, the Great Northern, and the Manchester, Sheffield & Lincolnehire railways, and the works have recently heen commenced. The design is also of tha ssme character as that of the St. Pancras roof, the spsn being 210 feet and the length 550 feet. The cast and wrought iron will weigh upwsrds of 2,300 tons, of which nesrly the whole will be in the roof itself. It is expected that the Glasgow roof will be completed next summer, and the Manchester roof dnring the following year.—*London Times.*

The Lonoest Bridge in the World —A piece of engineering enterprise of great magnitude and importsuce is just now, says *Iron*, making rapid progress, namely, the new viaduct across the estuary of the Tay. The first stone of the Tay bridge was laid on the Fifeshire side of the Tay in the month of July, 1871. The estimated cost of the nndertaking wss from £200,000 to £220,000. The object of the nndertaking was that of connecting the important msnufacturing town of Dundea with the North British railway company's branch between Edinhurgh and Tayport. The length of the bridge is 10,321 feet, and in shape it is not nnlike the letter S. It is the longest bridge over a running stream in the world. On tbis account its constrnction was looked npon as one of the most importsnt engineering works of recent times. Nor was it in respect of length alone that it claimed to be nniqne, and threstened to tax all the constructive resources of its builders. It was beset with even grester trials on account of the Tay being a tidal river, liable to enormous floods and exposed to blasts of wind from east to west, which seemed likely not only to hinder the progress of the work bnt to destroy such progress as had actually been made. For a long time very little progress was made in the work of construction on account of the experimentsl chsrscter of the operations and the frequent accidents that befel. Dnring the last 18 months, however, very substsntial progress has been made.

Stone-Cutting Machinery.—At the English society of engineers, a paper on stone-cutting machinery, by Mr. Henry Conradi, was read. The author first noticed the ordinary stone-sawing machines as worked by hand. He then described the improved machinery for cutting and dressing stone as in nse at the New Law Courts by Messrs. Bull & Sons, the contractors. It consists of a timber stand, carrying a cast-iron ssw-frame suspended by the corners to the npper psrt of the frame. The ssw-frame is raised or lowered by means of winches and chains. The anthor also described some saw-frames for stone, with both horizontal snd vertical revolving disc-cntters by which the stone is cut. The author then proceeded, by the aid of disgrams, to describe a stone-sawing machine designed by himself, and which has been made and nsed in Frsnce. In this machine the author reversed the principle adopted in ordinsry stone-sawing frames, making the fixed stand a movable one, carrying the saw-frame with it in its forward and backward motion, the frame receiving its vertical motion from a suspension arrangement. This sawing-frame is usually driven by means of a semi-portable engine of speoial construotion, which was decribed by the anthor.

French Railways.—In Frsnce all railrosds are built nnder the supervision of the government. The State axarciaes tha most minnte supervision. At the expiration of ths period of concession, the government succeeds to all the rights of tha company over aach road. If the company do not keep the road in good repair, the State reservee tha right to eeize several yeare before the coucession terminates. Tha State determinee tha styla of oars that shall be employed, fixee the rate at which passengere shall be charged per kilometer, and the tolls of freight, whather at low speed or high, and does not permit a lowering of theee ratas except after au extended notice of such propoaed reduced rates has been published. It prescribee now the mails shall be osrried, and at what cosi, etc.

Another Submarine Tunnel.—Stimnlated donbtless by the project of joining England to the continent by a snhway nnder the Straits of Dover, which has arrived at its first prsctical siage, a Madrid pamphlateer proposss to tnnnel the Straits of Gibraltar and nnits Europe with Africa, while turning the flank of the fortress of Gibraltsr, on the English occupation of which the Spsnisrds hsve long looked with an evil eye. He snggeste thst the passage should commence hetween Tarifa and Algesiras on the Spanish, aud come out between Ceuta and Tangiers on tha African side. The submarine part of this tnnnel would be little more than a third of the length of thst between Eoglaud and France. On the other hand, as the maximnm depth of the sea at tha point in qnestion is 500 fathoms, and as it is proposed to lesve 300 feet of the rock betweeu the arch of tnnnel and the sea bottom, the tunnels of approach would have to be nearly six miles long on each side. The cost is estimsted at abont £4,000,000 sterling. It is very questionable, however few the engineering difficnlties, whether such a work could ever become a commercial success; bnt in conneotion with the snbmarine wsy under the channel, it would, ss its projector points ont, allow of an overlsnd railway route to India without change of carriage.

American Bridges for Brazil.—The favorite Americsn systems of bridge building have been adopted by the Brazilian government for nse in all future internsl improvements. The problems involved in the development of Brszil, says the *Iron Age*, are so similar to those which have been solved here, that her rnlers can doubtless imitate with profit snd advantage msny of our public works, purchase many of our supplies, and extend the process of buying cars and locomotives to the constrnction of Amerioan bridges and the nse of American coal.

Watering the Desert.—It appears from reoent explorations and surveys that the work of turning the Atlantio ocean into the Grest Desert of Africa is not so formidable an undertaking as was st first supposed. It is only neoessary to cut a channel through a bar about 300 yards wide. The level of the desert immediately behind this obstruction is some 330 feet below the sea level, which will give a pretty fair depth of water over which to stesm into the fertile hesrt of Africa.

A distinguished Frenoh engineer and secretary of the French geograpical sociaty, arrived at Washington recently to secure aid for a complete survey of the Centrsl Americsn isthmus. He was sstonished to learn that at vsrious times duriug the last 25 years this whole region has been surveyed, and 40 different routes over it proposed.

The Sun's Temperature.

The actual heat of the sun's snrface is one of the nnsettled questions of science, and estimstes have varied between 10,000,000 deg. and 2,700 deg. Fah. Professor S. P. Lsngley read a psper at the late meeting of the National academy of sciences, detailing how he compsred the sunlight with that from the molten steel poured ont of the Bessemer converter, and thus approximately estimated the solar temperature. A helioostst arrangemeut was employed to transmit a sunbeam into the foundry of the Edgar Thomson steel works, and a Ritchie photometer was nsed to measure the respective intensities of the lights. The first conclnsion reached was that the sun's light, which turns the light from the molten steel into a black spot, mnst be at least 50 times the greater. Than the spectroscope was employed and the two rays oompared. The stael rays were agsin blotted out. Hence the suu rays must have been at least 64 times brighter. Next, Professor Langley made comparisone of the snn's rays with those from the flames above the converter when the latter were at their brightest. This was a less difficult proceeding and furnished more specifio results. The photometric compsrison conld be made directly. It is admitted, however, that the flame light may not be quite as bright as that of the molten steel. The arrangement was somewhat like thst of a camera obscura. It gave the image of the sun so accurately that sun spots could be easily examined; it also gave an exsct representation of the furnace flame. Each was alternately superposed on the other. The conclusion is that the sunlight is at least 2,168 times brighter thsn the furnsce flame. As the heat is presumably of the same relative order, the result is adverse to the law of Dulong and Petit. The actnsl heat of the sun is probably among the higher values thst have been suggested.

Rich Ore.

Some very rich ora is now being takeu out of the ohimney recently cut in the Paxtou vein, Bowman incline, of the Manhattan mines. Thie ie tha narrowast vein (at thie point) now being worked by tha company, but the high grade ore which it carriae compeneatee in a graat measure for the narrowness of tha vein, and as it has been a good eized vein where worked in other portione, there ie avery reason to supposa it will increase in size. It is now about eight inchee in thickness, of the richest character of ruby silver ore, and aesaye up into tha thoueands. The ore vein on this ohimney is now baing worked throngh what ie known as the Paxton east drift, from the Bowman incline, and ae tha drift ia extended shows increaeed signs of regularity and permanancy. It has not yet been prospected above the drift, but as soon as the drift is extended to a sufficient distance into the chimney a shnte will he raised to prospect it above the Great Eastern works, a distance of about 50 feet, which will also giva ventilation to this psrt of the mine. Soms specimens have heen taken from this chimnay which assay $4,000 per ton in silver; bnt of course this is by no mesns au aversge, thongh lots of pieces of this kind can be picked from any portion of the chimney, and it could bs easily sorted to make a first claes that would work $3,000 per ton. It pays better, however, to send to the mill without sorting, as ora ranging from $300 to $500 can be worked to better advantsge than that of a very high grade.

The richness of the Lander hill ruby and antimonisl ores is so well known thst the production of ores ranging from $3,000 to $5,000 per ton has ceased to he a subject for wonder or astonishment to the people of this section. Comparatively lsrge bodies of this rich ore have heen enconntered before, near the snrface, but were generslly marred by breaks or slips, hut the workings have now penetrated beyond these influences and these bodies of exceedingly rich ore are found in regular chimneys, continning both lsterally and dowuward, without slip, hreak or interruption of any kind.—*Reese River Reveille.*

Idaho Mining Operation.

The Owyhee *Avalanche* says: From varions sources we are pleased to learn that mining operations in the Basin this sesson have been attended with more promising success than dnring aither of the psst five years. The people are in a hopeful mood and claim owners generally are well satisfied with the resnlt of their work during tha psst snmmer and the present fall. Thie section of the Territory will probably never witness such a prosperous period as that which fell to their lot some 12 years ago, but it may be safely predicted that the day is not far off that will, according to the present ontlook, ensure to them a degree of permanent prosperity in their mining operations, snch as will guarantee a comfortable support of more than donble their preseut population. The quartz claims open out most promisingly, and many parties interested in them have done a handsome businese dnring the past six months, while tha placer claims have yielded generally very satisfsctory returns. Information that we havs obtained from qnite reliable sonrces places the valne of the bullion snd dust shipments from the Basin this year st figures somewhat in excess of $1,000,000. From Idaho City alone tha shipments will exceed the snm of $700,000, and it is calculated that the amount realized from claims in Placerville, Pioneerville, Grsnite Creek, Qusrtzburg and other sections of the basin, will reach abont 50 per cent. of that figure. This is a good showing, and we shonld not be surprised, in view of the prospects of work at Banner, with operations on a larger sosle in the qusrtz mines generally in this district, that the product of the coming year for the Basin will fall not far short of $2,000,000. The merchants and business men generally here feel quite hopeful over the sitnation. Their oredit is good abroad; their losses for the past few years have been mainly made up and future prosperity may be counted upon with tolerable certainty. The Basin to-day occupies a more promising position than most of the other miuing districts of the Territory. The dark clouds have all passed away and the faith of the people in future success is well fonnded.

The Dsnskin Bros. do a heavy business on claims in the vicinity of Granite creek aud are among the most extensive snd most active mining operators in the Territory. They keep nearly 70 men employed, principally on placer diggings. A few weeks sgo they purchased a magnificent mining property on Canyon creek, comprising rich gravel diggings and qusrtz, for which they paid $20,000. They havs a heavy interest in most of the placer claims about Grsnite creek which they have owned and worked for the past four years, and many of which they sre now working on shares. They give employment to a large nnmber of Chinamen, and since our lsst visit here we find that the Celestials have built np qnite a little village almost in the hesrt of Granite Creek, and nnmber probably more than 100 of the population of thst burg. The Danskins (two brothers being engsged in the bnsiness here) do a heavy business at their store aud carry a larger stock of goods than auy other housa in tha Basin. They hava done a fine business the past season and will continue operations on quite a large scale the coming winter. They are solid, reliable men, intimately identified with tha businese interests of the Bssin, and from the perseverance and energy they have displayed in conducting their business they have shown themselves fully antitled to the success they are meeting with.

Tarnish on Electro-plate Goods may ba ramoved by immersing the article from ona to fifteen minntee, or nntil tha tarnish ie removed, but no longar, in the following solution: Rsin water two gallons, cyanuret potash half ponnd; dissolve and pnt into a stone jng or jar, and cloeely cork. After immersing, the articla mnst be tskan out and thoronghly rineed in two or three waters; then dried with a soft linen oloth, or, if frosted or ohased work, with fina clean sawdust. Tarnishad jewelry may be speedily rsstored by thie process; but make sura work of removing tha alkali, otherwisa it will corroda tha goods.

The Connelly Mine.

Within the past few weeks a number of important changes have taken place in and about the Connelly mine, on Prospect mountain, and those who have not been in that vicinity of late would be surprised to note the many improvements now completed and under way. The Connelly is one of a series of mines owned by the British mill and mining company and every indication points to its soon becoming a valuable property. Mr. John Potter, Superintendent of the company's affairs here has been indefatigable in straightening out the mixed condition of affairs which confronted him on his arrival, and the energetic, business-like manner in which he has accomplished the task shows him to be the right man in the right place and one of whom the home company can well be proud.

Some time since the company purchased the hoisting works of the Page and Pannca mine of Pioche, which at a later date were shipped here. The machinery, as good as new, has been placed in proper position over the shaft of the Connelly, and well housed in, and on Saturday last steam was gotten up and the shrill echo of the whistle sounded for the first time. The machinery was found to be in admirable working order; but a few slight changes are needed, when it will be in perfect order, and during the present week operations will be commenced in good earnest. The shaft is now down a depth of over one hundred feet and Superintendent Potter has his entire winter's work planned. The shaft is to be continued to a depth of 250 or 300 feet when drifts will be run both ways and the usual cross-cutting carried on. Fifteen men working in two shifts are now employed at the mine and will be during the winter, after which the number will be increased. Several veins of ore have been tapped during the prospecting work, carrying a fine quality of ore, enough being in sight to insure a successful run of the company's mill at Pinto next spring, which Mr. Potter intends starting up at that time. The air shaft at the mine, which a former superintendent had filled up, is being cleaned out, which, when finished, will greatly benefit the miners and accelerate operations. Aleck McKenzie, a miner of great experience and one of the original locators of the Connelly, is the foreman of the mine, and to whom great credit is due for the present favorable condition of the property. We hope Mr. Potter's most sanguine hopes may be realized and the British mill and mining company occupy a position among our prominent and successful companies, which it would have done long ago but for the incapacity of those who, at an earlier date, had charge of the affairs of the company.—*Eureka Sentinel.*

Virginia and Gold Hill Water Company.

The Gold Hill *News* says: Captain Overton, of the Virginia and Gold Hill water company, reports 35 men working on the long tunnel to tap Marlette lake. The tunnel will be 4,000 feet when finished. It is now over two-thirds done. Considerable water is running out, probably 120 miners' inches. The progress has been hindered of late by the encountering of a vein of sand and broken rock. This vein was seven feet in thickness only, yet it took about two weeks of hard work to get through it. The broken rock prevents spiling from being driven in to stop the flow of sand, which made it necessary to bulkhead the tunnel to keep it out. Five or six similar veins have been cut before and caused similar delays.

The four-foot dam, which was formerly thrown across the outlet of the lake, has been raised 10 feet higher, thereby doubling the surface of the lake, as it previously existed, and making it five times as large as at low water. This has increased the amount of water immensely, so that now there is enough in the lake to supply this city and vicinity for a year, and the great accumulation of the rains of the fall and snows of winter will swell the amount still more. Connection will be completed with this lake as early as May next and before any scarcity can be possibly felt from the dry season.

The estimated cost of the tunnel above mentioned was $65,000. The work will cost over $150,000. When we stop to consider the importance of the supply of water which the company are furnishing the city and vicinity, and that but for it this whole section, if inhabited at all, could sustain but a very few people and fewer mining and milling interests, the real blessings which are daily distributed in the shape of the purest, best water in the world, become more apparent, and we appreciate more highly the great work which the company have accomplished and are still accomplishing for our good as well as their own profit.

A Supplementary Exhibition.—A dispatch from Washington says: An organization is being perfected by which facilities will be afforded exhibitors, both foreign and American, to continue the exhibition of their goods in the main exhibition building after the close of the Centennial exhibition, that building having been purchased from the Centennial Board of Finance for the purpose of creating a permanent exhibition. The exhibite will comprise the following classes: Mining, manufactures, education and science, art, machinery, agriculture and horticulture. The space will not be charged for; but the unpacking and rearrangement of exhibits, and the transportation, etc., of new exhibits must be done at the expenee of the exhibitors.

Useful Information.

What We Find in Coal.

Professor Wm. F. Roberts says: The coal itself, even where it is most abundant, constitutes but an insignificant portion of the whole thickness of the carboniferous strata of the ancient coal formation. Most of the coal seams rest upon an under clay, containing stigmaria, the fossil rootlets of the plant called sigillaria. Professor Goppert examined the coal fields of Germany and stated that he detected in beds of pure coal the remains of plants of every family, then known to occur, fossil in the coal. Many seams, he remarks, are rich in sigillaria, lepidodendra, and stigmaria, the latter in such abundance as to appear to form the bulk of the coal. In some places almost all the plants were calamites, in others ferns. In a cut for a railway in Lancashire, England, in the distance of 100 feet, six fossil trees were discovered, standing in vertical position to the dip of the strata, which was 15 degrees south. The roots were imbedded in an argillaceous shale underlying a seam of coal about eight inches thick. Beneath the coal seam and around the base of the trees more than a bushel of fossil cones, supposed to be the fruit of the lepidodendron, were gathered. In the carboniferous strata of Coalbrook Dale, and in other coal fields, these fossil cones are met with, some of which are five inches long. One of the trees found in the cut measured 15¼ feet at the base and seven and one-half feet at 11 feet, its discovered hight. In the Newcastle, Bristol, and other coal fields, these vertical stems are called by the miners coal pipes. These cylindrical casts of fossil trees now forming solid sandstone, after the coal is mined from underneath sometimes slide suddenly down and cause fatal accidents. The cliffs, known as South Joggins, on the coast of Nova Scotia, afford admirable sections of the coal bearing strata, containing fossils of the forests of the carboniferous period. Large trunks of trees are seen standing at right angles to the dip of the sandstone strata, showing that they were, before this strata was deposited, standing in an upright position; now they incline at an angle of 150 degrees from the vertical line The vertical hight of these cliffs is from 150 to 200 feet. At low tide a fine horizontal section of the strata is exposed to view on the beach. Lyell and Dawson, in 1852, made a detailed examination of one portion of the strata, 1,400 feet thick, where the coal seams are most frequent, and found evidence of root bearing soils at 68 different levels, clearly showing 68 fossil forests, ranged one above the other, in this coal field in the above mentioned thickness of stratu.

Comparative Cost of Illumination.

A number of experiments, says the *Iron Age*, have been made lately in London, to test the comparative cost of illumination with the various materials used for that purpose. Below is the result, the first colnmn containing a description of the materials tested; the second, the price of the material in London, reckoning 24 cents to the shilling; the third column shows the duration of the light furnished for one cent, the light being reduced to equal one sperm candle. With the exception of the last named material, common gas, the prices do not vary sufficiently from those which prevail here to effect the value of the comparison. London gas is reputedly of inferior illuminating power, so that the economy of its use can scarcely be so much greater than ours, as its cheapness would seem to indicate.

		h.	m.
Standard sperm candles, per lb	$0.48	1	7
Best wax candle, lb	.48	1	6
Sperm oil in moderator, per gal	2.28	1	12
Belmont sperm candle, per lb	.30	1	27
Stella, or Burmese wax, per lb	.30	1	37
Petroline candle, per lb	.36	2	15
Composite candle, No. 1, per lb	.22	2	5
" " No. 3, "	.16	2	45
Common dip candles, per lb	.12	2	52
Almond oil, in moderator, per gal	2.22	3	..
Colza, per gal	1.20	4	37
Paraffin oil, in lamp, per gal	.72	9	35
Common gas, per 1,000 it	.90	26	..

The price of gas being about three times as great in most American cities as in London, no such marked advantage as appears in the table can accrue from its use on the score of cost. Still, it must rank among the most economical of artificial illuminations—at least three or four times as economical as common candles for a given amount of light.

Amber.—Reboux states that at the eocene epoch the bed of the Baltic sea was occupied by an immense forest, which spread over nearly the whole northern continent. Dredging carried on at a depth of 6.4 feet below the sea bottom has brought to light thereby two species of conifers, a poplar, a chestnut, and various other trees. From the conifers, the author thinks, ran the resin which, through being buried in the earth, has become changed into amber. The largest quantity of the gum appears to have been derived from the *Pinus succinus*. More than 200 specimens of objects have been found imbedded in the gum, including insects, reptiles, plants, leaves, grains, shells, fruit, etc. The density of natural amber varies from 1.09 to 1.11. Its analysis, according to Schrotter, is: Carbon, 78.82; hydrogen, 10.23; oxygen, 10.90.

Notes on Furniture Cleaning.

Furniture Cream.—1. Yellow wax, 4 ozs.; yellow soap, 2 ozs.; water, 50 ozs.; boil, with constant stirring, and add boiled oil and oil of turpentine, each 5 ozs. 2. Soft water, 1 gallon; soap, 4 ozs.; white wax, in shavings, 1 lb. Boil together and add 2 ozs. of pearlash. To be diluted with water, laid on with a paint brush, and polished off with a hard brush or cloth. 3. Wax, 3 ozs.; pearlash, 2 ozs.; water, 6 ozs. Heat together and add 4 ozs. of boiled oil and 5 ozs. of spirits of turpentine.

White Furniture Cream.—Raw linseed oil, 6 ozs.; white wine vinegar, 3 ozs.; methylated spirit, 3 ozs.; butter of antimony, ½ oz.; mix the linseed oil with the vinegar by degrees, and shake well so as to prevent separation; add the spirit and antimony and mix thoroughly.

Cleaning and Polishing Mahogany.—Take 1 pint of the furniture oil, mix it with ½ pint of spirits of turpentine and ½ pint of vinegar; wet a woolen rag with the liquid and rub the wood the way of the grain, then polish with a piece of flannel and soft cloth.

To Renovate Wicker Tables.—Paint them over with Brunswick black; it is used for work and fancy baskets, is not expensive, and can be procured at the grocer's.

Removing Varnish from Wood.—A strong application of ordinary spirits of camphor will remove almost any kind of polish or varnish. Give the spirit time to evaporate before repolishing, or it will injure the new polish. Another.—The plan I adopt to remove varnish from wood is to make a strong solution of soda, soap and water, and keep the place constantly wet while I go on scraping. This softens the varnish, and I afterwards rub down with paper previous to revarnishing.

To Restore Soiled Steel Engravings.—Lay the engraving on a plate of glass a few inches larger than the picture, then pour distilled water over the same to the hight of a line and let it soak for a few hours; then pour off the water and renew the process several times, after which allow the water to drip off well and pour Eau de Javeille upon the picture and allow the same to work upon it for not more than one-quarter of an hour. After this rinse the picture off again with distilled water, and repeat the treatment with Eau de Javeille according to desire. Now rinse the picture with a thin solution of hyposulphite of soda and then an abundance of fresh water, after which set the glass and picture upright on a sheet of blotting paper and allow the water to drip off until the picture is dry. Of course great care must be taken if the process of bleaching is to be a complete success.

Immigration.—During the year ending June 30th, 1876, there arrived in the United States an army of 169,986 immigrants from almost every country in Europe, though chiefly from England, Ireland and Germany. The number for previous years was as follows: 1872, 404,806; 1873, 459,803; 1874, 313 339; 1875, 227,498. The dropping off to 169,986 for the last year is not encouraging in comparison, and yet even that number is about 20,000 more than the whole population of the State of Delaware, and means an important addition to our productive power.

To remove ink marks from paper without affecting the smoothness and gloss of the surface, it will be found sufficient in most cases to moisten the inked surface first with a solution of cyanide of potassium and then of oxalic acid. A camel's hair brush may be used to apply the two liquids, being dipped alternately in each until the marks have disappeared.

Quick Time.—The Allan Royal mail steamer *Polynesian*, which lately arrived at Liverpool from Quebec with the Canadian mails in 7 days and 16 hours, brought passengers who had come, via Quebec, from San Francisco, and landed them in Liverpool on the 16th day from their leaving San Francisco; this is probably the smartest run on record.

Good Health.

Value of "Good Health."

Editors Press:—Will you not give us the price of *Hall's Journal of Health*, and whether we can obtain it in San Francisco? We would like to have your opinion on Prof. O. S. Fowler, as an author and physician; will you give it to us?

We read with great interest your "Good Health" column every time, and we cannot be too thankful for having at least one paper which will teach us how to enjoy life, for we cannot enjoy it unless we obey the laws of nature. Yes, such is the greatest enjoyment of life; and every disobedience is punished sooner or later, whether it is done by ignorance, idleness, or wilfulness, as "Philmore" truly says. We farmers as a class know very little about the laws of health, and but for our pure air and good exercise, God only knows what would become of us. The sufferings are only too great and long. We know all about the food that is required in quality and quantity to make our horses strong and active, to make our cows give plenty and rich milk, to make our hogs fat, to make our chickens lay plenty of eggs, but what is required for our own dear selves we are entirely ignorant of. We know nothing about the function of the stomach; if it gets out of order we resort to Quack's medicine, and if we have to call in an honest physician at last, he tells us, "your stomach has got more sense than your head." We do not know what to make of it. We hear sermons by the learned Rev. Strutton, or able Betts, or plucky Dillion, delivered from the text, "the ways of the transgressor are strange," but they are of very little good, because the wise will hardly need them and the rest do not understand. I tell you, Mr. Editor, your "Good Health" column is worth the subscription price to every farmer, and we can do no better than to pray for more space. N.

Santa Clara, Nov. 8th.

Hall's Journal of Health costs $2 per year, and can be best obtained by sending directly to the publishers, at No. 137 Eighth street, New York City.

The value of Prof. Fowler's phrenological work depends upon the belief of the one who makes the estimate. It is a matter of opinion which we cannot decide. His other writings contain much that is true and a great deal that is debatable. We believe him honest and a worker of much good in his way.—Eds Press.]

Food and Health.

At a recent meeting of the American Public Health Association, Prof. Austin Smith, of New York, gave a discourse on "Food in its Relations to Personal and Public Health." He treated the subject in a popular, rather than a strictly scientific way, and endeavored to correct certain popular errors. In the first place, he stated that there is no uniformity in the requirements of alimentation, that there is no average to be applied to individuals; and that while observation and experience will afford a measure of quantity and the selection of kinds of food for considerable bodies of men, there is no means of determining individual cases, excepting by the natural instincts of hunger, appetite and taste, and by personal experience. He spoke chiefly of the instincts, considering personal experience of importance principally as a regulator of the instincts. Hunger was pronounced abnormal, and appetite the normal condition which determines at what time and how much we shall eat. Appetite might lead us to eat too much; and then experience came in as a regulator. Appetite was not an infallible guide, but the best, nevertheless; and in this connection Dr. Flint criticised in a quietly caustic way the old notion of rising from the table before the appetite is appeased, and of eating only at regular intervals, no matter how strong the appetite may be. The instinct of taste, gustation, the speaker said, was abused even worse than appetite—shamefully abused. Appetite told us when and how much to eat; taste what to eat. Here the doctor alluded to the prevalence of poor cooking, and made a complimentary observation on William E. Baker's proposed donation toward founding a college of cookery. His remarks on the subject of dyspepsia were rather singular. He said it was a great mistake to suppose that the chief end of man was to observe the process of digestion, and the sole inference to be drawn from this part of his discourse was that dyspepsia is frequently due to the imagination. He also ridiculed, in a polite way, the notions of people that certain articles of food, wholesome to others, are injurious to or do not agree with them.

Gymnastic Exercise.

Persons who are ambitious of becoming muscular will do well to study the result of an official inquiry which, according to the *Medical Examiner*, has lately been instituted at a military gymnastic school in France. The inquiry, which extended over a period of six months, showed: 1. That the muscular force is increased on the average 15 to 17 per cent. and occasionally from 25 to 30 per cent. the force having a tendency to become equal on both sides of the body. 2. That the capacity of the chest is increased one-sixth at the lowest. 3. That the weight of the individual is increased from six to seven per cent., and occasionally from 10 to 15 per cent, while the bulk of the body is diminished, thus showing that the profit is confined to the muscular system. The increase of muscular force was generally confined to the first three months of the course. During the last moiety a serious diminution usually occurred; and here the dynamometer gave positive indication of the necessity of moderating or suspending the exercise. The truth is, gymnastic exercises, like all other things, require to be taken in moderation, and if indulged in to excess do infinitely more harm than good. In the meantime, there is one simple method of taking exercise which, notwithstanding its advantages, is for some unaccountable reason wholly neglected by vast numbers of persons who are constantly complaining of the ill effects on their constitution of what they term "sedentary pursuits"—namely, walking.

Asthma Relieved by Belladonna Leaves.—Dr. C. E. Reeves, in the Melbourne *Med. Record*, speaks very highly of the speedy relief obtained by smoking belladonna leavee in spasmodic asthma. He finds about two and one-half grains smoked in a pipe is suffioient to give immediate relief.

MINING AND SCIENTIFIC PRESS.

W. B. EWEB.....SENIOR EDITOR.

DEWEY & CO., Publishers.

A. T. DEWEY, GEO. H. STRONG
W. B. EWEB, JNO. L. BOONE

Office, No. 224 Sansome St., S. E. Corner of California St., San Francisco.

Subscription and Advertieing Rates:

ADVERTISING RATES.—1 week.	1 month.	3 mos.	12 mos.
Per line..... .25	.80	$2.00	$5.00
Half inch (1 square)...$1.00	3.00	7.50	24.00
One inch..... 1.50	4.00	12.00	40.00

Four weeks are rated a month.

Large advertisements at favorable rates. Special or reading notices, legal advertisements, notices appearing in extraordinary type or in particular parts of the paper inserted at special rates.

SUBSCRIPTIONS payable in advance—For one year, $4; six months, $2.25; three months, $1.25. Remittances by Registered letters or P. O. orders at our risk

SAMPLE COPIES.—Occasionally we send copies of this paper to persons who we believe would be benefited by subscribing for it, or willing to assist us in extending its circulation. We call the attention of such to our prospectus and tarms of subscription.

THE ORIGINAL ARTICLES in this paper are mostly set in solid type, giving in our columns one-third more reading than is contained in ordinary leaded matter.

ADDRESS all letters to the firm, and not to individual members, or others, who may at any time be absent from our office.

Our latest forms go to press on Thursday evening.

San Francisco:
Saturday Morning, Nov. 18, 1876.

TABLE OF CONTENTS.

GENERAL EDITORIALS.—Items of Interest from the Mines; Improvement in Hinge Joints, 329. The "Eyes" of a Mine; Exhausted Nature; The Election; Rivers and Deep Canyons, 336. The Close of the Centennial; Transportation Inquiry; Workshop Surroundings, 337. Patents and Inventions, 341.

ILLUSTRATIONS.—The "Imperial" Hinge Joint, 329. View from Belmont Mansion, Fairmount Park, 337.

MECHANICAL PROGRESS.—Making Stone with Steam Hammers; Sheffield Coming to America; A Russian Manufacturer; Prevention of Smoke; American Progress; Soft Steel; Blowers; Activity in Car Building; Crumbling Brays, 331.

SCIENTIFIC PROGRESS.—Fruit Pollen; The Meeting of the National Academy of Sciences; The Position of Science in Modern Life; Purification of Metals by Filtration; Electro-Magnetic Experiment; The Windings of Rivers, 331.

MINING STOCK MARKET.—Sales at the San Francisco, Pacific and California Stock Boards; Notices of Assessments; Meetings and Dividends; Review of the Stock Market for the Week, 332.

MINING SUMMARY from various counties in California, Nevada, Oregon, Idaho, Montana and Utah, 333-341.

THE ENGINEER.—The New York and Brooklyn Bridge; Shortest Line Across the Isthmus; The Tallest Lighthouse in the World; Roofs of Enormous Width; The Longest Bridge in the World; Stone-Cutting Machinery; French Railways; Another Submarine Tunnel; American Bridges for Brazil; Watering the Desert, 334.

USEFUL INFORMATION.—What we Find in Coal; Comparative Cost of Illumination; Amber; Notes on Furniture Cleaning; To Restore Soiled Steel Engravings; Immigration; Quick Time, 335.

GOOD HEALTH.—Value of "Good Health;" Food and Health; Gymnastic Exercise; Asthma Relieved by Belladonna Leaves, 335.

GENERAL NEWS.—General News Items and Miscellaneous Paragraphs, on 340 and other pages.

MISCELLANEOUS ARTICLES.—Mining Suits, 329. Improvements in Treating Ores; The Polar Sea; Georgia's Gold Mines; The Black Hills Telegraph, 330. The Sun's Temperature; Rich Ore; Idaho Mining Operation, 334. The Connelly Mine; Virginia and Gold Hill Water Company; A Supplementary Exhibition, 335. The Cost of Mining and Smelting, 336. Gems and Precious Stones, 340.

NEW ADVERTISEMENTS.

Asthma and Catarrh Remedy, D. Langell, Apple Creek, Ohio; Cerro Bonito Quicksilver Mining Co.—Assessment; Mariposa Land and Mining Company of California; Assessment.

FREE BADGE OVER THE SACRAMENTO.—The citizens of Red Bluff, on Tuesday last, celebrated the completion of the bridge across the Sacramento river at that point. It was built by the Tehama company at a cost of $35,000, the California bridge company being the contractors. The exercises were extensive and impressive, consisting of a procession, driving the last spike, reading of the order of the Board of Supervisors, accepting the bridge contract, and an oration by Hon. E. J. Lewis. The citizens presented Supervisor French, and the Superintendent of Construction Higgins, each with an elegant and costly gold watch. Superintendent Brady was the recipient of a set of diamond shirt studs, and Superintendent Powell of an ivory carpenter's rule and a pair of amethyst sleeve buttons. The bridge is now open to the public.

GEMS AND PRECIOUS STONES.—The series of articles on this subject, by Henry G. Hanks, which have been running for some time in the PRESS, is concluded in this issue. The very valuable and well-arranged table on page 340 concludes the subject. Mr. Hauka has spent considerable time and labor in writing the articles, which we are sure have been appreciated.

NEWFOUNDLAND advices report several shipwrecks with loss of crews. A brig drifted into Crow harbor in Fortune bay, with four of the crew dead and lashed to the rigging.

The "Eyes" of a Mine.

It is a common practice among English miners to pass rich deposits in a mine and leave them undisturbed to fall back upon whenever the general average of the yield threatens to fall below a dividend paying point. These known rich spots are called the "eyes" of a mine, and are seldom removed when first discovered, unless, indeed, the mine is worked on a stock jobbing basis. The custom in this country is very different. Our miners generally pick out the "eyes" of a mine as soon as they get within reach of them, and then leave the mine to darkness and abandonment. The records of California and Nevada show a good many mines with their "eyes" picked out, which, with proper management, might have been made remunerative.

It requires considerable determination to pass a rich spot in a mine and go on delving into the earth after other ore, and few are able to resist the temptation. Moreover, it is not always necessary to do so. If a mine is yielding well and richer ore is struck, as a general thing that richer ore comes out first. There are circumstances, however, when this is not always judicious. For instance, if the underground works are in such a shape that but few men can work, the most of the labor should be directed to opening up the mine for more room, before the richer ore is removed. When a mine is owned by a few persons, all taking an active part in its development, they can, if the mine is paying, afford to pass a rich spot temporarily; but when a large corporation owns it, disputes would naturally ensue should rich ore be passed and prospecting work be continued. Again, in most cases ready money is needed to carry on operations, and the first good ore found is expected to meet the expenses, so the sooner it is found the better.

It sometimes happens, however, that in the anxiety to get at a rich spot great damage is done to the future working of the mine. An instance in the writer's recollection will illustrate this. After a little 40-foot shaft had been sunk in a certain mine in this State, a drift was run in on the ledge, the ore improving as the drift advanced. The superintendent thought then that instead of working there he had better sink another shaft further along, so as to strike the rich spot. This he did, and a few feet down disclosed very good rock. Then, instead of going to work properly he began to run a wide surface cut between the two shafts so as to get the rich ore out with little expense. This work was kept up for considerable time, the mine paying very well. The cut kept getting deeper and deeper, and pretty soon they found they were working at great disadvantage. After awhile there was a big cave, and a lot of surface water came in and work was suspended for the winter. In the spring they were compelled to go to a great expense to get the mine in any sort of condition to work, and then had to go to work on their shaft again. The operations previously carried on were found to be a great hindrance. This was a case of mistaken judgment for which the superintendent was properly blamed; but he contended that he wanted to get the richest ore out first and as quickly as he could, leaving the future to take care of itself.

Exhausted Nature.

[Written for the PRESS by JOHN L. BOONE.]

One would judge, from a superficial glance at the progress made during the last century, that it would not take many more centuries of invention and discovery, especially if they are as prolific as the last, to exhaust the laboratory of nature of its hidden facts and leave nothing further to be sought or desired; but we must remember that a fact discovered develops a number of other facts, each of which is as fruitful as its parent, so that we establish a geometrical progression which is in reality endless. Following this rule, therefore, we shall only be more enlightened as to the depth of our darkness a dozen centuries hence than we are now. We have so far only skimmed the surface, only discovered rudimentary facts; we have exposed the croppings, but it remains for us to follow up the veins in their various dips, spurs and angles, during which progress we are sure to find many scientific bonanzas. The one matter of electricity, although it has already been utilized to the great benefit of mankind, and to-day forms one of the necessary elements of commercial relations—and a very convenient element of civilization—is only understood in its general nature. There is no question but that electricity possesses elements, capabilities and powers yet to be discovered that will cast all of its present uses and advantages far in the shade. The steam engine is a mighty power, docile as an infant when properly managed and capable of exerting immense power when properly applied, but we require a still more powerful engine; facts convince us that somewhere in nature there is a more powerful force, and one capable of being controlled and utilized as easily as the steam force. It may be that we have already unearthed the agent which will develop into this future Samson,

Whether this be so or not, one thing we may depend on, and that is that whatever the initial power or force may be, it must go through all the stages of gradual development before it can actually exist in a useful form. The history of all our important mechanical inventions establishes this fact. No man can so far advance beyond the capabilities of others, either as the result of education, research or discovery, as to be able to produce, at a single stroke, an entirely novel, complete and perfect machine, based upon newly discovered principles.

Take, for instance, the sewing machine, as a familiar example. We can trace it back through the hands of hundreds of inventors and skillful workmen, each of whom added his mite of improvement before it became a perfect machine. So with the telegraph, so with the steam engine, so with all important inventions. The investigators of such matters aid one another to the final result. We must have the germ before we can produce the consequence. No one man of his own powers discovers even the germ; like the monkeys who cross the stream by one of their number suspending himself by his tail from an overhanging limb, while others suspend themselves from him until a line of sufficient length is formed to enable them to swing across and bridge the stream; it is the last monkey of the string that first reaches the opposite bank. So it is that one discovery enables another person to reach a little further, and by a similar effort develop another fact or discovery. And, strange as it may appear, it is seldom that nature has endowed a single person with the faculty of reaching beyond his own discovery in any one line of invention; either the effort required to make the discovery exhausts the enthusiasm of the individual, or the mind is disqualified for further research; possibly ambition is satisfied, and, like the fox in the race with the turtle, lies down to sleep, while another searcher after hidden truths passes on to the next discovery. If the Keeley motor had proven itself to be all that was claimed for it, it would have stood alone as an exception to the rule we have just stated. Keeley would then have assumed a position in the field of invention which has as yet not been awarded to any other individual. We would simply regard him as superhuman. But his failure is only another evidence of the universality of the rule we have stated.

Nature will not be exhausted until humanity and the inventive spirit are exhausted. Supply capable brains and nature will supply capable fuel for them to consume. Every patent for an invention issued by our government is a trail that leads to others. No matter whether it is profitable or not; no matter whether it ever assumes any other form than the mere publication of the description contained in the specification, nevertheless it is useful. It is either a finger-board pointing out the way to others, or a skull and cross bones warning others from continuing in the same course.

The Election.

The week brings no solution of the presidential issue. The country has watched from morning to morning for indications of the final result, but it is still within the realm of controversy. The issue is closer than has been known in the history of the country, and the length of time required to canvass the result enables us to realize the length of waiting which our ancestors endured before the days of railroads and telegraphs. The final result now depends upon the official canvass in three of the Southern States, and it may be another week at least before the choice of the people can be announced. The events are exciting and the charges of fraud are exchanged from side to side in different parts of the country. As yet good order prevails everywhere, and thus we trust it may prevail until the result is declared by a fair count.

Another note of the week is the reclending of the Eastern horizon, where Turks and Russians lie waiting the conclusion of the armistice which has been agreed upon. The rumors are quite redolent of war, when the stated peace is over.

BULLION SHIPMENTS.—Since our last issue shipments of bullion from prominent mines have been as follows: Northern Belle, November 7th, $12,006.26; Comanche, 7th, $7,620.92; California, 9th, $105,638.74—total to date, $156,782.74; Con. Virginia, 9th, $185,723 83—total for October, $1,335,989.71; Tybo, November 3d, $13,439.87—total to date, $75,195.70; Manhattan, 10th, $11,770; Grand Prize, 8th, one bar bullion; Justice, 8th, $55,000; Northern Belle, 9th. $12,017.25; Ophir, 9th, $11,036.96—total for October, $277,117.11; Leopard, total for October, $69,763.00; Grand Prize, November 9th, one bar bullion, and 10th, one bar; Modoc, 10th, 500 bars; total for November, $33,500; 13th, first shipment in November, $7,934; Manhattan, 10th, $11,774 04, total for week, $24,139.43; California, 13th, $87,388.56; total to date, $244,171.30; Con. Virginia, 13th, $92,768.16; Manhattan, 14th, $12,389; Tybo, 8th, $9,046 97, first shipment for November account; Grand Prize, 13th, two bars of bullion. Northern Belle, Nov. 12th, $18,000.98; California, Nov. 14th, $108,160.80; total to date, $352,322.10; Con. Virginia, Nov. 14th, $23,319.20; total to date, $119,087.36; Modoc Con., Nov. 12th, 300 bars; total for month to date, $37,800; Grand Prize, Nov. 14th, $2,378.72.

ON Tuesday, at eight o'clock, 1,700 kegs of Santa Cruz powder were exploded by electricity in the Enterprise mine at Smartsville. It was witnessed by a large number of people, and was a grand success.

Rivers and Deep Canyons.

The wearing away of the earth by the action of streams is familiar to all; but the vastness of this influence in modifying the surface of the earth is rarely appreciated, except by the professed geologist. In passing across the continent, from the Atlantic to the Pacific, the regularly increased evidence of this action is noticeable at almost every stage of progress. It is not, however, until the traveler has passed the crest of the Rocky mountains, that he beholds the most extraordinary phenomena of this description. Very deep canyons are comparatively rare east of those mountains, while they become the almost invariable rule to the west of them. Two of the most remarkable instances of this character are, perhaps, the Black Rock canyon, on the route from the Great Bend of the Humboldt to Goose lake and Oregon, and the still more famous canyon of the Colorado. This latter is rightly considered the most remarkable depression, or rather excavation, of the kind in the world. It has never been properly understood or appreciated, until the appearance of Powell's report on the subject, published lately by the Government. The land of this region is an elevated plateau, and for many miles the Colorado flows through it, in a narrow channel, 6,000 feet below the plateau!

Throughout the entire western flank of the Sierra Nevada, the principal rivers, in the upper portion of their course, have generally cut their way down from 2,000 to 4,000 feet in depth, with banks upon either side rising at an angle of from 35 deg. to 45 deg. with the plane of the river. It has been supposed by many that these channels were formed before the rocks had become so much indurated as to prevent any very serious obstacle to their being worn away. But such could not have been the case, as we find that before the present river courses had an existence, there was another system of rivers, running at almost right angles with the present water courses. In excavating into the beds of these ancient rivers, as the miners are now doing in thousands of places, we find most unmistakable evidences that even they flowed over the country after the country had become fully as much indurated as it now is. The upper branches of the American river have, in some places, worn their way 3,000 feet below the beds of these ancient streams. In almost every part of our mountains this characteristic is manifest, even to the most casual observer, although it is difficult to imagine the forces and time required to have accomplished such results.

The Cost of Mining and Smelting.

For the benefit and guidance of those interested in mines producing smelting ore, we give some complete and authentic figures on the subject, furnished to the Inyo *Independent* by Mr. W. Belshaw, of the Union Consolidated mining company, Cerro Gordo, Inyo county, Cal. These figures are taken from practical work and results, and are therefore of more than ordinary interest. The statement covers a period extending from February 1st to October 1st, 1876:

Total cost of mining and reduction, including interest on capital.....		$198,625 84
viz:		
Mining expenses.....	$154,966 61	
Furnace "	137,822 36	
Interest "	5,736 87	
Cost of mining 9,950 tons ore.....		$54,968 61
viz:		
Labor.....	$37,695 55	
Water.....	1,871 79	
Hauling ore.....	5,143 83	
Powder and fuse.....	585 10	
Candles.....	340 00	
Wood.....	1,508 50	
Blacksmithing.....	937 46	
Timbers and lagging.....	1,505 22	
Freights and sundries.....	2,379 36	
Superintendence.....	2,500 00	
Carbonates and oxides (soft ores).....		tons, 8,220
Estimated cost per ton for mining.....		$4 43
Sulphuret or galena ores.....		tons, 812
Estimated cost per ton for mining.....		$10 00
Silver bearing quartz ores bought and mined, tons, 1,118		
Estimated cost per ton.....		$11 00
Average assay of 8,220 tons.....		20 per cent. lead.
Average assay of 612 tons.....		70 per cent. lead

WAGES AT MINE:

Foremen and engineers, per day.....	$5 00
Ordinary labor, per day.....	4 00

Mining Superintendent, J. L. Porter.

Cost of reduction of 9,950 tons of ore.....		$137,822 36
viz:		
Coal, 1,950⅔ ton at $38 per ton...	$74,405 28	
Labor.....	31,339 87	
Wood.....	4,037 12	
Water.....	3,367 21	
Blacksmithing.....	458 29	
Freights.....	2,456 64	
Superintendence.....	4,999 86	
Paid men accidentally injured.....	474 35	
House expenses.....	3,235 56	
San Francisco office expenses.....	714 75	
Stable expenses.....	761 38	
Cerro Gordo office, legal, taxes, surveying and sundry expenses.	1,650 00	
Tools, oils and repairs.....	4,892 25	
Cost per ton of ores, reduction.....		$13 85
Cost per ton of ores, mining.....		5 53
Cost per ton of ores, interest.....		58
Total per ton for mining and reduction.....		$19 96

WAGES AT FURNACE:

Engineers and chargers, per day.....	$5 00
Ordinary labor, per day.....	4 00

Superintendent of furnace, Hugh Morrison; Assistant Superintendent, Wm. E. Goodrum.

Total running time of furnaces, 331 days; tons of lead produced, 1,325—or 64 per cent. of lead assay; 90 per cent. of silver values saved. Yours respectfully,

M. W. BELSHAW, Sup't Union Con. M. Co.

The Close of the Centennial.

The great exposition is formally closed, although there is yet opportunity for those who desire to behold it in its dissolving grandeur. The exercises at the closing were as marked as those at the beginning, and the affair was well assigned to history. The telegraph brought the following outline of the ceremonies of the closing day, November 10th: Great numbers of people were in attendance at the Centennial grounds, to witness the formal closing of the exposition. Shortly before 2 o'clock President Grant, escorted by Governor Hawley, ascended to the platform, followed by the Centennial Commissioners, the Board of Finance, Foreign Commissioners and invited guests. After the excitement of the multitude, occasioned by the presence of General Grant, had subsided, the orchestra, under the direction of Theodore Thomas, performed Wagner's Inauguration March, composed for the opening exercises on the 10th of May last. At its conclusion, Rev. Jos. A. Reiss offered up a prayer. The chorus, accompanied by the orchestra, then sang a choral, entitled, "Fugue," by S. Bach, after which an address was delivered by Hon. D. J. Morrell, United States Centennial Commissioner from Pennsylvania and chairman of the ex-Commission. The orchestra then rendered selections, after which Hon. John Welsh, President of the Centennial Board of Finance, delivered an address. After Beethoven's Fifth Symphony had been rendered, Director-General Goshorn addressed the audience at length. Handel's Hallelujah Chorus was next given by the orchestra and chorus, and Hon. Jas. R. Hawley, President of the United States Centennial Commission, delivered an address reviewing the history of the exposition. The audience joined in singing "America;" after which President Grant declared the international exposition of 1876 closed. The Doxology was sung by the chorus and audience, accompanied by the orchestra, and the formal ceremonies were concluded.

With the close of the Centennial exposition, Fairmount park becomes again the particular pleasure ground of Philadelphia, enriched by the scenes in which the world took part. Our illustration on this page reflects this idea and is a fitting scene with which to close our Centennial reports. There have been arrangements made by which the city of Philadelphia will retain some of the exhibition buildings to grace her pleasure-ground. The main building has been purchased by a stock company, and will be preserved for a permanent exhibition. The Art Gallery was constructed with a view to its remaining, and some other structures will doubtless battle with time until it conquers and removes them.

VIEW FROM BELMONT MANSION, FAIRMOUNT PARK.

The exposition has been a success far greater than was anticipated. The total number of visitors was more than eight millions and the money receipts will exceed the expenditures by one and a half million dollars, it is estimated. This money will either go to recompense the government for its endowment, as there is a clause in the appropriation bill to this effect, or will be divided among the holders of Centennial stock.

Now that the great event is over, it is fitting to dismiss it with a few notes of the good it has accomplished. Every one who has visited the Centennial, says the *Iron Age*, has gone away with larger and more liberal ideas, and a knowledge which will bear fruit for years to come. Vast multitudes whose lives were bounded by narrow limits, and who knew and thought of little beyond the commonplace happenings of their daily experience, have been drawn from home and brought into contact with the activities of a world of which they had but vague ideas at most. Without fully realizing it, they have imbibed a vast amount of useful knowledge which will not be forgotten. However general may have been their survey of the exhibition, they have learned something which can be applied at once in their daily occupations. Beside this, they have had stimulated that pride of American citizenship and love of country which will inspire them to a more hearty loyalty and a more active desire to promote to the fullest extent the welfare of our common country.

As an educator for the producing classes of the country, the Centennial has been of incalculable benefit. The millions of farmers, manufacturers and mechanics who have wandered through the aisles of the various buildings, picking up ideas and examining the products of other nations and other sections of the country, have not gone away empty handed. What they have learned will appear in ways perhaps, never to be directly traced to the education they have gained at the Centennial, but which must be placed in the scale as a fair offset to the expended millions.

In the extension and development of our export trade, we shall probably feel the benefits of the Centennial to an extent not now appreciated. The testimony which foreign visitors have borne to the variety and excellence of our machinery, our manufactures and our resources, will attract general attention to us and make the extension of our export trade an easy matter. We do not know how great the attendance from abroad has been, but it has been largely composed of representative men who have access to the public ear at all times. With but few and unimportant exceptions, they have borne generous testimony to the excellence of American productions, and the correspondents of foreign journals have, almost without exception, done us full and impartial justice. The fact that we are entitled to recognition as occupying a front rank among producing nations has been forced upon the attention of all the civilized nations of the globe, and nothing more is needed to prepare the way for such an extension of our export trade in manufactures as we may find safe and profitable.

However considered, the Centennial will result in benefits so great, so far reaching and so permanent, that the few millions which it has cost cannot be considered as of any importance in comparison with it. As an exhibition, it has fairly exceeded the largest promises of its projectors. It is something which, as a nation, we have a right to be proud of; something which we can remember with satisfaction, and of which the next generation will cherish mementoes. It is too near to be seen to advantage, or fully appreciated. A year or two hence we will understand it better, and probably have better reasons than now appears to feel satisfied with the results of our Centennial.

A DISPATCH from Calcutta to the *Times*, referring to the heavy cyclone in India, says: It is reported that 20,000 persons perished in the cyclone of Oct. 31st, and some estimates place the loss of lives as high as 40,000. In the town of Burrishol, capital of the Bakergunge district, 3,000 houses were leveled with the earth. Letters from survivors report that a great wave nine feet deep swept over the large island of Dakhin Shahbazpore. The whole of Eastern Bengal appeared to suffer severely from the cyclone. Calcutta narrowly escaped. Reports of the famine from Bombay are worse. A water famine is feared in some districts.

SUTRO TUNNEL.—There are 204 miners' inches of water flowing from the Sutro tunnel. This at the mouth has a temperature of 58 degrees, but at the header it is 87 degrees. The tunnel is now in 14,915 feet, the header being in porphyry. The temperature of air at the mouth of the tunnel is 79 degrees and at the header it is 88 degrees.

Transportation Inquiry.

It will be remembered that the Legislature last winter created a board of transportation commissioners, to investigate the subject of railway management in this State. The measure was in some sense a result of the agitation of the subject of freights and fares, which was caused by the introduction of the "Archer bill." There seemed to be a need that a fuller knowledge should be had of the matters concerning the building and present operation of our railroads, before the subject could be intelligently legislated about. The board of commissioners, through their secretary, Walter M. Phillips, have issued a circular calling upon the people to bring before them statements and suggestions which will aid in the prosecution of their work. From a copy which we have received we extract the following: "Among the principal objects proposed by the Legislature in creating the board of transportation commissioners is the compilation of facts and statistics connected with the building and operation of railroads in this State, and also the investigation of their management, especially as it affects the interests of their patrons and the public generally. It is believed that an impartial investigation of this subject will result in substantial advantage to all concerned, and to this end this board desires to receive information and suggestions and statements from all who are interested. As your position has probably led you to give more than usual attention to the subject, there may be matters to which, in your opinion, the attention of the board should be called, in which event it is requested that you will communicate them to this board in writing."

We commend this matter to our readers as worthy their thought and attention. There are hardships connected with the management of the railways of this State which those who suffer them can best describe and protest against. It is generally believed that these corporations are demanding more than their share of the productive profits of our producers, and considering the bounty which the roads have received they should not draw so heavily upon their patrons for the service they render. Now an opportunity is given by the Legislature to those who have evidence which gives grounds to these beliefs to present it before the commission and have it figure in their reports. As we understand their circular announcement, they are ready for suggestions as well as affidavits, and will follow out any direction of inquiry which seems to need the pursuit. It will be well both for individuals and communities which deem themselves the objects of discrimination or unjust charge, to act together in advancing the investigation of the commission. The office of the commission is at Sacramento, where all communications may be addressed.

THE developments in Hunter district, 45 miles north of Ward, are excellent, on the Vulcan lode, and it is stated that three furnaces will be built there next spring.

THE Ætna mine, Napa county, which was sold at sheriff's sale, brought $6,000. C. Hartson was the purchaser.

Workshop Surroundings.

A little disposition on the part of owners, in respect to the comfort of those who look to them for employment, will create a tie of interest that will be reciprocal, and each will feel that the other is necessary for his support, and that they cannot well succeed if separated. As a rule, employers pay too little attention to cheerful surroundings for their employees, in any branch of business. There are exceptions of course, and it is well to note that where these exceptions occur, a more prosperous general appearance is manifest.

There are but few workshops that may be said to be attractive in their surroundings. The majority of them are dark, crowded, dreary places, where a stated stint of labor is performed according to a pre-arranged agreement, for which a stipulated price is paid. Beyond this there is but little in the majority of our workshops, and were it not for the daily call of want there would be no incentive to labor. We have seen workshops that were dark and damp, destroying the health and buoyancy of the spirits of the operatives, when a small sum, perhaps, would add not only warmth and light, but fill the place with pleasant surroundings. The surroundings of the place of labor have more influence upon the operative than many are aware of. Give a mechanic clumsy tools to work with, a rough dirty bench to work upon, imperfect light, scarcely elbow room and but little care exercised if he have proper ventilation and warmth, and he will become careless, his work partaking of the surroundings in which he is placed. He will think more of getting his wages at a certain time than of the completion of his work. A few years of this experience will spoil almost any workman, no matter how good he may be.

But give him, on the contrary, good tools to work with and a nice place in which to perform his labor, and he will insensibly take more pains with it than in a bad and ill arranged apartment. In a pleasant room, he will, of his own accord, keep his tools and work in order, and more cheerfully perform the task assigned him. A kind of magnetic influence of the surroundings will infuse itself into the operative, and his work will partake of that nature and go from him stamped with the impress of the influence thus created.

There is no reason why the place of business should not be surrounded with pleasant influences as well as the home. Most of a man's active life is passed in his place of business, and why it is kept so severely unattractive is a mystery to many. The shop is certainly the mine from which he draws his wealth, and might he not spare a small sum to make it attractive to others and himself also?

This carelessness on the part of employers is by no means confined to them in workshops alone. It is apparent in almost every branch of industry. The workmen are too often looked upon as mere machines, who require no other incentive to labor than wages promptly paid. Wages are, of course, the prime incentive to labor, but other things must be taken into consideration when good work is expected. There must be harmony between employer and employed or the employer does not get as much for his money as he otherwise would. Looking at it from a mere financial standpoint, it would be infinitely better for employers to pay more attention to the comfort of employees than is usually the case. It makes the greatest difference possible, whether a whole business runs smoothly or not; and to make it run smoothly in all departments the employees must be satisfied that their employers look to their comfort as well as the result of their labor.

THE big cable was put on the rolls at the Combination shaft, this week. This is the largest cable ever brought to the Comstock, its total length being 2,900 feet, and its weight 12 tons. It measures 7 inches in width and five-eighths of an inch in thickness. It will easily handle 60 tons.

FRANCIS D. MOULTON has withdrawn his suit against Henry Ward Beecher.

Testing and Working Silver Ores.

The above is the title of an illustrated work of 114 pages, for miners and prospectors hy Chas. H. Aaron, which has just heen issued by Dewey & Co. Mr. Aaron has managed to give many nseful hints and suggestions, free from all technicalities, and in auch a style as to be easily comprehended. It is written for tha miner, with no chemical symhols or metallurgical technicalities to confuse those who are not chemists or metallurgists. The following summary of the contents of the work will give an idea of its scope:

Under the heading of the first chapter, "Testing Cres for Silver," we find paragraphs on ore formation, test for silver, with heat and water, acid or hlow pipe. In speaking of testing for a process, the extent and richness of ore is considered, smelting ores, selecting and working sample, appliances for testing, roasting, etc. Under the head of "Working Cres" the author describes Aaron's process, has something to say of snperheated steam, preparation of dichlorida of copper and protochloride of copper, use of copper and iron, quantity of chemicals, carbonate of lime, chloride ores, amalgam, Patchen's process, etc. He also describes the methods of working roasted ores, treatment of base metals, stirring, heat of furnace, want of sulphur, etc. Under the head of "Leaching Processes" are the titles, Smelting, Mexican process, Kroencke's process, Chilean process, etc. Under "Pulverizing Machines" are described the arastra and its construction and operation, stamp batteries, screens, Crocker's trip-hammer battery, Paul's pulverizing barrel, Kendall's battery, Noice's pulverizer, a cheap rock hreaker, etc.

In speaking of amalgamators the anthor describes a cheap amalgamator, grinding the ore, directions for making a harrel, preventing mechanical wear, nse of qnicksilver, copper in hars, Freiherg barrel, cheap harrel, trough, harrel on rollers, Aaron's amalgamator, separator, etc.

He describes an improved retort, roasting fnrnace, furnace tools and furnace huilding. Among tha miscellaneons mention may he found Aaron's leaching apparatus, with two or three different arrangements a sm all mill, sampling tailings and settling tanks, dichloride of copper, etc. Mr. Aaron is a practical miner, of long working experience on this coast.

The hook is a serviceahle one for miners' and prospectors' nse. Price, post free, (in leather,) $2.00. Address Dewey & Co., MINING AND SCIENTIFIC PRESS, 224 Sansome street, San Francisco.

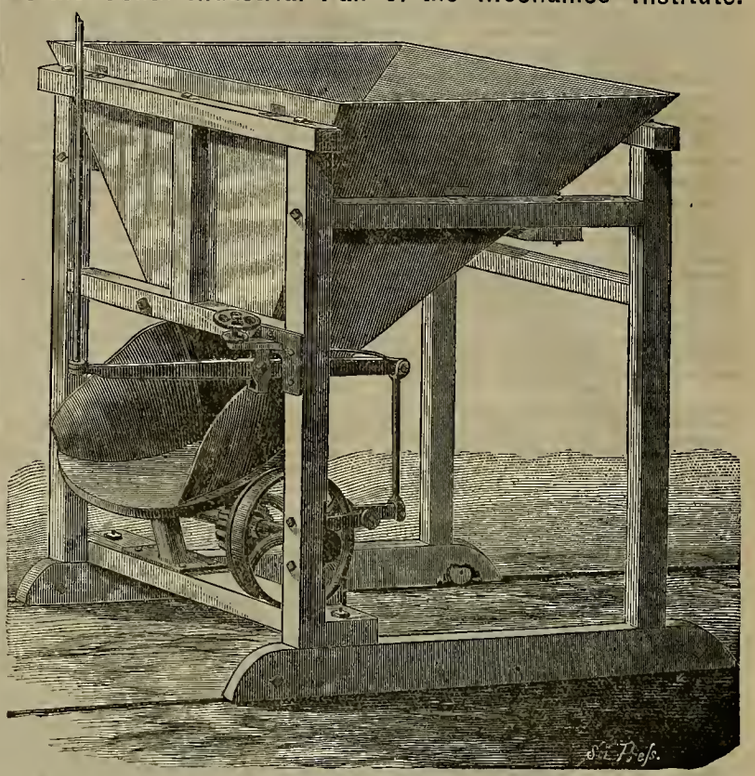
$1,000 Challenge Ore Feeder,

AWARDED FIRST PREMIUM

At the Tenth Industrial Fair of the Mechanics' Institute.



It may be considered as now fully demonstrated, by careful and long-continued experimentation, that tha plan upon which a perfect ore feeder must be constructed is that of the *carrier*, and not that of the shaking table. Uniform and accurate feeding is not possible npon the latter plan. The ore must he evenly carried, upon a steadily advancing plane, or table, to the line of discharge, and there simply *dropped* Spasmodic or jerky contrivances will not answer the pnrpose.

REFERENCES.

A letter received from the Julian Mill, Newcastle, says, of the Carrier Feeder: "It is the most perfect Feeder we have ever seen; don't see how any mill can do without them."——A letter from Mr. C. C. Belding, of Amador County, speaks in the highest terms of them.——Two of the machines were shipped to the Bunker Hill Mill, also Gover Mill, Amador County.——Mr. Stevenson, of Boston Mill, Gold Hill, Nevada, says they are the best Feeder he has ever seen.——Soulsby Mill, Tuolumne County.——California Company, Nevada City.——Omaha Gold Mining Company, Grass Valley.——St. Patrick Mill, Placer County.

$1,000 CHALLENGE.

Backward in Coming Forward.

C. P. STANFORD FAILS TO COME TO TIME ON THE CHALLENGE OF $1,000 TO TEST THE MERITS OF HIS ORE FEEDER AS AGAINST MINE. THE CHALLENGE IS STILL OPEN TO HIM OR ANY ONE ELSE. *GENTLEMEN, PUT UP OR SHUT UP.*

We warrant the machines to give perfect satisfaction, and to be a better and more durable Feeder than any other in the market, and will sell them as cheap as any other of its class.

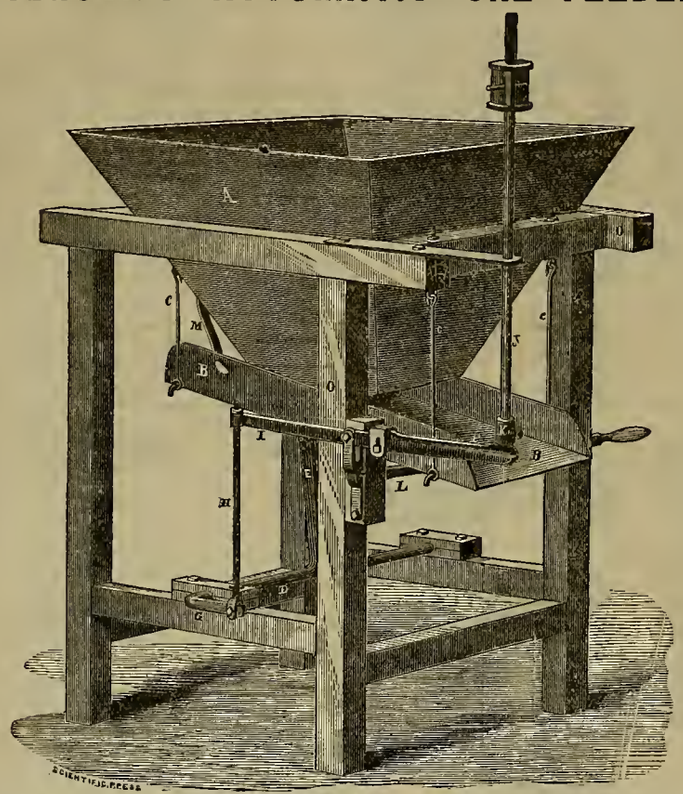
TULLOCH'S AUTOMATIC ORE FEEDER.



The TULLOCH AUTOMATIC ORE FEEDERS have been practically tested during the last year and a half in 40 mills, of from five to 80 stamps each, and have, in every case, given perfect satisfaction. The Tulloch machine is so constructed that the drop of the stamp feeds the ore in just such quantities as the stamps require. Each drop regulates the supply required for the next drop, whether it be more or less, and this is the true principle of an automatic feeder. The tray moves longitudinally, and a stationary scraper forces the material forward at each backward movement of the tray, thus insuring the perfect feeding of all classes of ore, whether it be dry or wet.

We append a few extracts from the many testimonials which we have received from mill men and practical mining men, of the effectiveness and positive action of the Tulloch Feeder. We do not depend solely upon these testimonials, as we are aware that testimonials are easily secured for almost any machine, but the high character of the parties certifying to those herewith given, will establish their value and genuineness:

Mr. Jas. G. Fair has 28 in use; says: I regard them superior to any Feeder with which I am acquainted; I consider no mill perfect without them. Mr. E. R. Burke, Sumner mine, Kern county, has 16: They never get tired; no man living can feed a battery as well; they save us in labor alone $48 a day. Mr. Green, of the Phœnix mill (12), Amador, writes: The first machine we had is working away; is as good as ever; have not spent a dime on it; in use 14 months; you need fear no competition on wet ores. Mr. W. H. Armstrong, of Consolidated Virginia mill: We are running 60 stamps with your Feeders; they give unbounded satisfaction; they have not cost the company one dollar since starting up. Mr. H. C. Bidwell, Supt. Green Mountain and Gold Stripe companies, Plumas county, writes: From the start they have done splendidly; no trouble whatever; requiring but little attention; a boy can manage them; the saving in both labor and castings is fully one half over the old style of feeding by hand. Mr. Preston writes: I have four of your Automatic Self Feeders, and my mill men each and all say they are the best they have ever used. They are an improvement on all I have ever seen, being simple in construction, and good for either wet or dry crushing; refer to over 40 mills using them; they are guaranteed to give perfect satisfaction. Send for circulars.

F. OGDEN, 417 Market Street, S. F.

San Francisco Cordage Company.

Established 1856.

We have just added a large amount of new machinery of the latest and most improved kind, and are again prepared to fill orders for Rope of any special lengths and sizes. Constantly on hand a large stock of Manila Rope, all sizes; Tarred Manila Rope; Hay Rope; Whale Line, etc., etc.

PAUL'S DRY PROCESS.

I am now prepared to test gold and silver milling ores in any quantity from TEN POUNDS to FIFTY TONS, and assert my ability to prove, by machinery NOW UP, and open to public inspection, and by practical testing of its merits, that I can increase the yield of gold mills, working wet batteries and copper plates, from FIFTY to ONE HUNDRED PER CENT., and on silver ores a much larger percentage than by pan amalgamation, and at less expense than any known method of working quartz well; and from some "gold" ores of California can extract more silver extra with the gold, which is now lost, than all the expenses of mining and milling. Having had 25 years' practical experience in milling gold and silver ores, I presume to know whereof I speak, and AM PREPARED TO PROVE ALL I ASSERT. These mills, for simplicity, cheapness practicability and perfection in working, challenge the skill of the age to surpass. Quartz miners who desire to investigate and have their ore tested, are invited to a critical examination of the machinery and process, and can receive permits for examination, particulars and pamphlets explaining process by calling at my office. ALMARIN B. PAUL.

TABLE FOR DETERMINATION.

Compiled for the "Mining and Scientific Press," by Henry G. Hanks.

[CONCLUDED.]

| | PHYSICAL PROPERTIES. | | | | | | | CHEMICAL COMPOSITION. | | | | | | |

(Continued from Page 333.)

still in ledge material of a favorable character.

NIAGARA.—Sinking the main incline is making good progress, the bottom still in very hard blasting rock.

BEST & BELCHER.—The damages by the water have all been repaired and work resumed in both the east cross-cut and the face of the north drift in the Consolidated Virginia ground.

MINT.—Sinking the shaft is making splendid progress. It is now down 1,308 feet, the bottom in good blasting rock.

ALTA.—The water has been drained and the sinking resumed with all possible energy.

SOUTH PARK.—Prospects excellent, the ore streaks showing wider and assaying better as further advancement is made.

ELY DISTRICT.

BULLIONVILLE FURNACE.—Pioche *Record*, Nov. 5: The new furnace recently erected at Bullionville started up yesterday morning. Should its workings prove satisfactory it will be a permanent institution. The indications are very favorable. The Nevada mine, formerly known as the Huhn & Hunt, has now about 400 tons of ore on the dump. About 100 tons have been hauled to the furnace, which is of 20-ton capacity. The parties owning this mine intend to prospect it thoroughly, and from present appearances will ultimately develop a very large body of ore.

Colorado.

BULLION.—Colorado *Mining Review*, Nov. 4: The Judd & Crosby works have shipped for the week ending Nov. 3d, $7,808.

BURLEIGH TUNNEL.—The lessees are now extracting large amounts of ore which mills 27 ounces silver and 60 to 65 per cent. lead. With a strong vein and their facilities for mining, this grade of mineral returns a handsome profit for all concerned.

ELM CITY.—This vein has heretofore been worked entirely on the west side of the Silver Plume tunnel, though considerable work has been done on the eastern side. Last week this was accomplished, and a solid body of ore, 1,000 to 1,800 ounces in value, was discovered, much to the satisfaction of the owners.

MATHEWS & COMPANY'S CONCENTRATING WORKS.—The machinery in this mill is in position, the bins and orshouse crowded with ore, and the managers fully expected to begin concentrating last week. Some difficulty, however, has been found in the action of the sizing-machine, which, it is hoped, will shortly be remedied, and the mill started up immediately.

DIAMOND TUNNEL.—We learn from J. A. Fisher, superintendent, that this tunnel has cut two more veins during the week, making five distinct and separate ore veins intersected within a distance of 44 feet. The progress of the tunnel for the month of October was 45 feet.

BALTIMORE TUNNEL.—John Tomay, Esq., informs us that he has leased the Baltimore tunnel lode, 50 feet from the mouth of the tunnel, to parties who agree to develop the property in a miner-like manner.

STEVENS.—Sixteen men are now employed on the tramway between the tunnel and the wagon road. The snows and stormy weather of the last two weeks have retarded the work considerably, but Mr. Hanson is pushing it forward vigorously, and will soon have it completed.

Idaho.

SALE OF MINING PROPERTY.—Idaho *Statesman*, Nov. 11: Mr. Otto Grant called on us last Saturday on his way East. He has lately sold his half interest in the Young & Grant mining claims on the Payette—formerly the "Warriner claims." J. P. Mann and Albert Church are the purchasers; consideration, $4,000 cash down. These claims were purchased by George Young and Otto Grant a year ago for $6,000 cash. They have taken out $5,000 tha present season, and they are good pay for a reasonable lifetime. Mr. Grant will go and see tha Black hills country, and then visit his old home in Davenport, Iowa, and return to the Black hills or this country in the spring. He has been in this Territory about ten years, and is an enterprising and worthy citizen.

Oregon.

GALICE CREEK MINING ITEMS,—Oregon *Sentinel*, Nov. 8. From a gentleman just from Galice creek we learn the following concerning the mines in that section:

Tha English company are now working the Reed diggings with a hydraulic, and have about completed their new ditch, two miles and a half long, and will probably turn in the water on Thos. claims this week. Both of these claims pay well and the company owning them will doubtless get large returns this winter.

Ankeny & Co., owners of the Courtney gravel claims, have run a bedrock tunnel in their claims over 100 feet. They are also constructing a new ditch, and have just received an eleven-inch hydraulic pipe for working their diggings.

Work on the Sugar Pine quartz ledge, owned by Green Bros., is being pushed forward. They are engaged in running a tunnel 175 feet in length to strike the ledge, and should it develop well they will put in machinery for working the same next season.

Work on the Yank ledge has been suspended for over a month.

The Centennial mining company, a gravel mining company near the Yank lead, on the north side of Rogue river, have recently constructed a ditch for working their claims, which will carry about 1,000 or 1,200 inches of water. They have just ordered 1,000 feet of 15-inch hydraulic pipe and an 11-inch giant nozzle. It is evident that this company means business.

August Emile is now working a rich gravel claim. It is reported that with an imperfect apparatus and small force he receives a clear profit of over $100 a week.

Montana.

CONCENTRATING WORKS AT GLENDALE.—Butte *Miner*, Nov. 7: At Glendala, Dahler & Armstrong's sampling and concentrating works and water jacket furnace are running. The furnace has only run about six weeks during the entire season, but in this time disposed of about 700 tons of ore. A scarcity of miners early in the season prevented mine owners from furnishing a running supply. The furnace, when in blast, turns from three to five tons of crude bullion every 24 hours, and consumes from 700 to 1,000 bushels of charcoal in the same time. The company is now putting up copper reduction works, to be completed in part this fall, and by July next expect to be turning out ingot copper and handle all ores above 12 per cent. Works will also be added that will enable the company to handle any of the silver or copper ores of this or any other country. The company has about 100 tons of crude copper which the new works will enable them to refine at an expense of only $25 per ton. The same quantity heretofore shipped to New York and refined cost $100 per ton, so the works will soon pay for themselves. Two charcoal kilns, substantially built of stone, enable the company to turn out 4,000 bushels of coal every ten days. Fourteen men are employed on the works, teamsters, choppers and others to be added.

MINES AND MINING IN AND AROUND TRAPPER.—The Franklin mine, owned by Gillig, Low & Keppler, is being worked, and will be during the winter. They have sold 50 tons of smelting ore this season that ran from $125 to $150 in silver and 45 per cent. lead, and now have 400 tons of milling ore on the dump. The main shaft is down 65 feet, and the lead is ten feet wide. The Cleopatra, owned by Pease, Taylor & Co., is a six-foot lode, with a shaft down 90 feet. The ore is carbonate of lead, contains 44 per cent. lead and carries one ounce of silver to each per cent. There are about 500 tons of ore on the dump. The Oneida and Bannack Chief, owned by Keppler, Hopkins & Taylor, is a large vein of copper and iron containing rich boulders of ore, 34 sacks of which were shipped and yielded 568 ounces of silver and 18.10 ounces of gold, and 50 per cent. copper. But little work has been done on the lods. The True Fissure, owned by Meade, Larwill, Bassette & Co., has a shaft down 120 feet. Forty tons worked by Larwill & Stapleton, at the Argenta smelter, with satisfactory results, and 40 tons were shipped to 'Frisco. The Elm Orlu, owned by Driscoll, Low & Ford, rich ore carrying a good per cent. of lead and from 160 to 230 ounces silver. The tunnel and main level is 500 feet in length. Its greatest depth is 135 feet, at which point the lode changes from a southern to a northern dip and shows a splendid four-foot vein—all shipping ore. One hundred and sixty tons of ore were shippped to Salt Lake this season. Twelve men are employed, and work will be carried on all winter.

Utah.

STAR DISTRICT.—Cor. Salt Lake *Tribune*, Nov. 11: The mining interests in the foothills of Star district are now looking up. The Vicksburg, owned by Donaldson & Cook, bids fair to become a bonanza. A large body of ore was exposed in this mine last week, which on being assayed went 70 ounces in silver and 78 per cent. lead—tip top smelting ore. Work is being pushed ahead on this mine with as many men as can work to advantage. The Minnesota is also being worked and looks well. This has a large body of low grade ore which gets better every day. This mine is owned by Liddle, Bro. & Cook. There are also quite a number of other claims in the foothills, and near this two big mines which look well. It is the intention of the owners to commence work soon. The smelter of Latey & Williams, at the river, is now ready to take this ores. The copper mines at Beaver Lake district are being worked. Messrs. Leonard & Lyons, I understand, have a fine body of copper ore in one of their mines which will assay 20 per cent. in copper. Major Holts is also working his claims in this district, and has already shipped into Shauntie a small quantity of very high grade ore. The great calcining ovens at 'Frisco are now running and doing good work. Look out for large shipments of bullion soon from the Horn Silver mine.

General News Items.

RUSSIA'S warlike preparations have created a feeling of alarm in Europe, and the prospects of peace are not so bright.

THE joint congressional committee to investigate the Chinese question is still in session in this city.

THE Rev. R. F. Parshall has sued the committee of the First Baptist church of Oakland for $100,000 damages for an alleged slander.

CARDINAL SIMEONI, recently papal nuncio at Madrid, has been appointed to succeed the late Cardinal Antonelli as secretary of state to the Pope.

THE general condition of the republic of Liberia is improving. Their products in coffee, sugar, etc., and their exports are steadily increasing.

GOVERNOR IAWIN has designated Thursday, November 30th, as a day of public thanksgiving, that being also the day fixed upon by the President.

THREE boys were drowned on Saturday last at Harbor View while bathing. One was the son of Mr Kent, janitor at Faulkner, Bell & Co.'s, and the other two were sons of Joseph G. Brackett.

JUDGE WESTBROOK has decided to grant the motion of the defendant, in the case of Monlton vs. Beecher, to change the venue to a northern county, and Delaware will be selected unless good reason for not doing so is given.

ALEXANDER DURBIN, JR., the young man who killed his father in the mountains eight or ten miles above Healdsburg on the 31st of October, after a full hearing was discharged, on the ground that the killing was in necessary self-defense.

OFFICERS of many of the banks in New York are complaining of the great difficulty in obtaining silver from the sub-treasury. A large coin broker on Wall street stated that one-half per cent. would be readily given for American silver, while he would charge one per cent. to purchasers. Of the sub-treasurer it was learned that he had no orders from Washington to issue additional silver.

Pacific Coast Railroad Notes.

All the trestles between Auburn and Dutch Flat, on the line of the Central Pacific, with the exception of the one near Cape Horn, have been filled in, and at places where the line of the road has been changed men are at work ling the rails, preparatory to changing the road bed.

The Amador *Ledger* of the 11th says: A correspondent at Ione telegraphs that the last spike of the Ione railroad was driven on Thursday at noon. It will be cheering news to most of our readers to know that the work is so far completed. We are not prepared to say whether the work of ballasting will have to be finished before passengers or freight pass over it. There seems to be a difference of opinion on that point. We understand, however, that general freight has already passed over the line at least as far as Buckeye. At any rate there is reason to hope that the road will very soon be open for regular passenger and freight traffic.

The first locomotive for the Sonoma Valley prismoidal railway has just been completed at the Pacific iron foundry in this city.

The official earnings of the Union Pacific railway for August are $1,363,175.85; same month last year, $1,015,458.73. For September the earnings were $1,305,985.99; same month last year, $1,155,941.36. Net earnings for August, $926,158.16; an increase of $362,920.52. Net earnings for September, $774,969.59; incrense, $104,207.92.

WOODWARD'S GARDENS embraces an Aquarium, Museum, Art Gallery, Conservatories, Tropical Houses, Menagerie, Seal Ponds and Skating Rink.

PATENTS & INVENTIONS.

A Weekly List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

FOR WEEK ENDING NOVEMBER 7TH, 1876.

COPY HOLDERS.—Harrison H. Hendrix, San Jose, Cal.

GOLD SEPARATORS.—Thomas W. Irvin, Eureka, Cal.

HYDRAULIC PROPULSION VESSELS.—Columbus A. Leaman and John A. Heckart, Pentz Ranch, Cal.

RE-ISSUES.

ICE MACHINES.—David Smith, S. F.

——The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

GOOD PRINTING INK.—We prefer Chas. Enen Johnson's printing inks, having used them on this paper for the past four years. H. S. Crocker & Co., printers, stationers, blank book and paper dealers, are Johnson's S. F. agents.—DEWEY & Co., Publishers.

THE MINING AND SCIENTIFIC PRESS is the leading journal of America. New processes and mechanical inventions are illustrated and discussed in its weekly issues. It is a 16-page sheet, handsomely printed, for $4 per year. Dewey & Co., publishers, San Francisco. —[Mt. Lincoln News, Alma, Colorado.

SEWING MACHINES.—We have a first-class machine we wish to dispose of on favorable terms. Apply at this office.

KNIGHT'S American Mechanical Dictionary is a book for all persons who make, buy, sell, use, or want to know anything about tools for machines, or are curious as to the history and development of mechanic art. It is a descriptive word-book of tools, instruments, machines, obemical and mechanical processes; civil, mechanical, railway, hydraulic and military engineering; a history of inventions; general technological vocabulary; and digest of mechanical appliances in science and the industrial and fine arts, etc. For circulars or price address or apply to A. Roman & Co., wholesale and retail booksellers, 11 Montgomery street, San Francisco.

Appreciative.

DEWEY & Co., San Francisco—

Gentlemen:—My patents for the Eclipse Baling Press and for my Improved Excavator have both come safely to hand. They are entirely satisfactory in all respects, and in my judgment, fully and clearly cover all the points to which I am entitled. I thank you esrnestly and sincerely for the care and dispatch you have used in both cases, but wish to acknowledge my especial obligations for the patient persistence with which you pushed my claims on the excavator, in the face of the various adverse decisions of the examiner. When you advised me to appeal on a certain claim, I had grave doubts of the advisability of the proceeding, but the result justified your judgment, and I was as much surprised as gratified when I received notice from you that the examiner had receded from his position in the matter, and that the money that I had advanced to prosecute the appeal was not needed, but awaited my order. I will add also that I had some misgivings as to the cost of patents obtained through your agency when compared with Eastern solicitors, but am glad to acknowledge that my cases have been as cheaply prosecuted by you as by parties East, to say nothing of the advantage of personal conference as to claims and the saving in point of time. I have two more models nearly ready for you. Yours respectfully,

JACOB PRICE.

HOW TO STOP YOUR PAPER.—If a subscriber wishes to stop his paper, do not direct the postmaster to return your paper. That will not stop it. Do not write upon it and return it yourself. That lays you liable to a fine. There are three ways to stop it: 1st. When you subscribe, state that you wish the paper to stop at the expiration of the time paid for. 2d. If you did not so expressly order, send a postal card, to reach us any time before the expiration. 3d. If you have neglected these two simple methods, and the time to which you have paid is past, send a letter enclosing pay for each paper issued since your subscription expired, at the rate of eight cents a copy or 33½ cents a month. If your paper does not stop promptly thereupon, you may be assured your letter has been miscarried; and, to test the fact, send a "postal" at once, that measures may be instituted for finding it or recovering the money.—*N. Y. Independent.*

Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

Office Cascade Blue Gravel Mining Company.

NOTICE.—A meeting of the stockholders of the Cascade Blue Gravel Mining Company will be held at the office of the company, 311 California street, rooms 3 and 4, second floor, San Francisco, Cal., on Monday, November 20th, 1876, at two o'clock P. M., for the purpose of disposing of the company's stock, and authorizing the sale of the entire property of the company, with any other business that may come before said company. R. F. KNOX, President,

J. M. BUFFINGTON, Secretary.

San Francisco, Oct. 13th, 1876.

Cerro Bonito Quicksilver Mining Company.

Location of principal place of business, San Francisco, Cal. Location of works, Cerro Bonito mining district, Fresno county, Cal.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 13th day of November, 1876, an assessment (No. 1) of four dollars per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the company, 418 California street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 18th day of December 1876, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the eighth (8th) day of January, 1877, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

J. W. CLARK, Secretary.

Office, Room No. 2, 418 California St., San Francisco, Cal

Eagle Quicksilver Mining Co.—Location of works, Santa Barbara county, Cal. Principal place of business, San Francisco, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 30th day of September, 1876, an assessment (No. 9) of two hundred and fifty ($250) dollars per share was levied upon all the shares of said company, payable immediately, in gold coin of the United States, to the Secretary, at his office, rooms 5 & 6, No. 302 Montgomery street, San Francisco, Cal.

Any shares upon which said assessment shall remain unpaid on Wednesday, the 29th day of November, 1876, shall be deemed delinquent, and will be duly advertised on Saturday, the second day of December, 1876, for sale at public auction, and unless payment shall be made before, will be sold on Monday, the fourth day of December, 1876, as provided by the articles of agreement of said company, to pay the delinquent assessment, together with cost of advertising and expense of sale. By order of Board of Trustees. WM. H. WATSON, Secretary.

Mariposa Land and Mining Company of California.

Location of principal place of business, San Francisco, Cal. Location of works, Mariposa county, Cal.

Notice is hereby given, that at a meeting of the Board of Directors, held on the ninth day of November, 1876, an assessment, No. 8, of one dollar per share was levied upon the capital stock of the corporation, payable immediately, in United States currency, to the Secretary, at the office of the Company, room 33, Nevada Block, No. 309 Montgomery street, San Francisco, Cal., or to the Assistant Secretary, at the office, No. 9 Nassau street, New York, N. Y.

Any stock upon which this assessment shall remain unpaid on the 11th day of December, 1876, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the eighth day of January, 1877, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

LEANDER LEAVITT, Secretary.

Office, Room No. 33, Nevada Block, No. 309 Montgomery street, San Francisco, Cal.

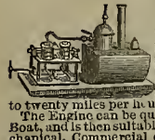
STEAM ENGINES, SAWMILLS, SHAFTING, GEARING AND MINING MACHINERY.

☞ Send for our illustrated catalogue.



Marine Screw Engines

And BOILERS for driving Model Yachts from one to ten feet in length, and Row-Boats or Skiffs 16 feet and upwards in length; either plain castings, partly finished, or complete ready for use, so constructed that a speed of from six to twenty miles per hour can be easily obtained.

The Engine can be quickly detached from the Yacht or Boat, and is then suitable for Agricultural, Domestic, Mechanical, Commercial or Amateur requirements, when small power only is needed.

☞ 100 Scroll Work Designs free on receipt of Stamp.

GEO. PARK, Buffalo, N. Y.

THE O'HARRA

CHLORIDIZING FURNACE.

Guaranteed to Chloridize from 85 to 95 per cent. of any gold or silver ores that are not more profitable for smelting. Will also desulphurize ores and put them in proper shape for working in cupola furnaces.

Cost of Roasting and Chloridizing by this Process:

Two cords of wood at $6	$12.00
Two firemen at $4	8.00
1500 lbs of salt at 1½c.	22.50
Wear of shoes and power	1.50
Cost for 15 tons	$44 00
Cost for one ton	2.93½

In a furnace of three or four times this capacity the cost is decreased by 20 per cent.

The furnace is now working successfully at the Pos Consolidated Co.'s mines, in the Pesvine District. For further information, apply to

D. J. O'HARRA,

Reno, Nevada.

PICKERING ENGINE GOVERNOR.

Vallejo Foundry, October 17th, 1876.

MESSRS. NEYLAN & YOUNG, San Francisco,

Agents "Pickering Governors."

Gents:—The 10 two-inch Improved Speed Adjusting Governors I bought of you this year for my Patent Straw Burning Threshing Engines give splendid satisfaction. They far surpass for regularity of speed any Governor that I have ever seen, and I have seen all of the best kinds; I have seen the main belt fly off the pulley several times this season while threshing, and the engineer did not discover it, so perfectly was the speed maintained, until he was told of it; this I consider something wonderful; I consider the Governor absolutely perfect, so far as speed is concerned. I bought, and put on to one of my engines a Shive Governor, to see which was the best and after one season's trial I have no hesitation in saying they are as far superior to the Shive, or any other Governor that I have seen or used, as the Shive Governor is to the old Butterfly Valve Governor. I wish you would send me the lowest price that you can furnish 25 Governors for next season's engines.

Yours, respectfully, I. L. HEALD.

LOOK

The Great Western Scroll Saw Co.'s New and Improved $5 00 Foot and Steam Power Scroll and Bracket Saw is the best one yet invented. With it men and boys are making from $3 to $10 per day. We will send you a Machine, six Saws, 15 Patterns and two feet of prepared wood on receipt of $5. Address,

GREAT WESTERN SCROLL SAW CO.,

Leavenworth, Kansas.

Diamond Drill Co.

The undersigned, owners of LESCHOT'S PATENT for DIAMOND-POINTED DRILLS, now brought to the highest state of perfection, are prepared to fill orders for the IMPROVED PROSPECTING and TUNNELING DRILLS, with or without power, at short notice, and at reduced prices. Abundant testimony furnished of the great economy and successful working of numerous machines in operation in the quartz and gravel mines on this coast. Circulars forwarded, and full information given upon application.

American & Foreign Patent Agents

OFFICE, 224 SANSOME STREET, S. F.

PATENTS obtained promptly; Caveats filed expeditiously; Patent reissues taken out; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent bnsiness, enable ns to abundantly satisfy our patrons; and our success and bnsiness are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secure, with the assistance of co-operative agents, claims in all foreign conntries which grant Patents, incinding Great Britain, France, Belgium, Prnssia, Austria, Baden, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wnrtemberg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Grenada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, bnt the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our sohedule prices for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We *can and do* get foreign pateuts for inventors in the Pacifio States from two to six months (according to the location of the conntry) SOONER than any other agents.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more correctly judge of the value and patentability of inventions discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valnable patents may be lost by extra time consnmed in trans mittiug specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communicatious and bnsiness transactions will be held strictly confidential by ns. Circnlars free.

Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already pateuted; hence we are frequently able to save our patrons the cost of a fruitless application by pointing them to the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applicants which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legiiimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money bnt their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

Engravings.

We have superior artists in our own office, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

DEWEY & CO.,

United States and Foreign Patent Agents, publishers Mining and Scientifio Press and the Paoific Rural Press, 224 Sansome St., S. F.

Mining and Scientific Press.

THIS PUBLICATION, SO VALUABLE FOR MINERS, MECHANICS AND MANUFACTURERS,

Will enter npon its THIRTY-THIRD Semi-Annual Volume on Saturday, January 6th, 1877. It bas ever been and will still continue to be the aim and object of tbe publishers to make tbe PRESS

A Practical and Interesting Journal.

To tbis end, we aim, through the constant watchfulness of our editors and correspondents, to sieze upon everything new in the way of mining and tbe various processes connected with tbe saving and separating of tbe precious metals, and place tbe same before our readers at the earliest day. It bas been well said that

A Newspaper is a Window

Through which men look out npon all that is going on in tbe world. Our window is a special one, so placed and arranged as to bring within the scope of its vision all that is going on

In the World of Mining, Mechanics and Science.

Without a paper of tbis kind, tbe miner or mecbanic is shut up in a small room or sbop and can know bnt ittle of what is going on in tbe world around him in relation to his particular calling. In tbis age of rapid progress books are necessarily slow and bebind the times. It is only through papers devoted to tbe specialty wbich be has cbosen tbat one can be easily apprised of tbe discovcries and improvements wbicb are constantly being made by bis fellow workers, and without a knowledge of wbicb he soon becomes a lag gard in the race.

The Value to the Community

Of sncb publications in disseminating important information, in checking useless and exploded experiments and in instigating important enterprises, can scarcely be overrated. Tbrough them tbe readings and observations of tbonsands are collected and collated, and brougbt directly to tbe sbop or table of tbe reader without any effort of bis own. For a mere trifle of cost he is regularly furnished witb an encyclopedia of just the information he needs—an unbonnd book forever issuing bnt never finished.

Nowhere in the Wide World

Is such an aid more needed tban by the miner of California. It is needed alike in the mill, in tbe mine and in the placer. We have here

The Largest Mining Field on the Globe,

Embracing a variety of minerals nowhere else found witbin tbe boundaries of a single field. We bave here also, men gatbered from every quarter of the globe, bringing with tbem tbe collective wisdom of tbe world,

Useful, Practical and Directly from the Field

Of labor. The mnstiness of books has been brnsbed away, and their minds are stored not only witb tbe experience of tbe past, but also witb tbe practice of the present. It is to tbis fact that we are indebted for our present

Able List of Correspondents,

Throngb whom we are able to promise to our readers so mucb tbat cannot be collected in the mere routine of office work. By tbe aid of such help our editors will be able, dnring the coming year, to do more than ever in furnishing information which shall be

Fresh, Novel and Interesting,

And which shall comprise all tbat is known of the latest and best means for saving gold and silver, and for economizing labor and cost in that direction.

Our Illustration Department

Will still continue to form an important feature, and no effort will be spared to make it of the greatest possible local and general interest to our readers. The important matter of

Home Manufactures and Inventions

Will also largely occupy tbe attention of the publishers and editors, and will be constantly encouraged, as an important means of furnishing employment to those wbo are seeking our shores, and adding to the wealth of the Pacific coast.

The Large and Increasing Circulation

Of a journal thus devoted exclusively to useful and practical information, speaks more in our behalf than anything we could say of ourselves, and is an encouragement to its further increase, especially in these times of trifling and trashy journalism.

The class of readers wbo are interested in such a publication as this, bave no need to be anything more than merely reminded tbat such journals are necessarily more costly than those of a lighter class, sucb as are read by tbe "million" and thrown aside as soon as read. Considering the character and location of tbe MINING AND SCIENTIFIC PRESS, our rates are as favorable as can possibly be afforded and do justice to tbe great industries in aid of wbicb we are laboring.

A Handy Map

Of California and tbe principal portion of Nevada will be furnished free to all subscribers who pay one year in advance, during tbe year 1876. Tbe map is plain, printed on tinted paper, about 16x20 inches, sbowing townships in California, and the counties, railroads and principal towns in California and Nevada.

We Prepay the Postage

On all papers sent to subscribers in the United States.

SUBSCRIPTION RATES, payable in advance: One year, $4. Sample copies free to tbose who will assist in obtaining subscribers.

DEWEY & CO., Publishers,

No. 224 Sansome street, S. F.—Jan, '76

Scientific and Practical Books on Mining, Metallurgy, Etc.

Published or issued, wbolasale and retail, by DEWEY & CO., MINING AND SCIENTIFIC PRESS Office, S. F.

BY GUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST.

Roasting of Gold and Silver Ores, and the Extraction of tbeir Respective Metals without Quicksilver. 1870.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in tbis country and in Europe, and explains the wby and wherefore.

It contains 142 pages, embracing illnstrations of fnnaces, implements and working apparatus.

It is a work of great merit, by an author whose putation is unsurpassed in bis specialty.

Price $2.50 coin, or $3 currency, postage free.

Concentratiou of Ores (of all kinds), including tbe Cblorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, with 120 Litbograpbic Diagrams. 1867.

This work is unequaled by any otber published, embracing the subjects treated. Its authority is higbly steemed and regarded by its readers; containing, as it oes, mucb essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, wbicb cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valnable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating macbinery, etc., wbich alone are of tbe greatest value. PRICE REDUCED TO $5.

The Explorers', Miners' and Metallurgists' Companion.

Comprising a Practical Exposition of the Various Departments of Exploration, Mining, Engineering, Assaying, and Metallurgy,

Containing 672 Pages and 83 Engravings

BY J. S. PHILLIPS, M. E.,

Of California, a Practical Operator for Thirty-four Years; Explorer, and Resident in tbe Pacifio States and Territories for tbe past Eight Years.

PRICE, bound in cloth, $10.50; in leather, $12. Forwarded by mail for 50c. extra, at tbe MINING AND SCIENTIFIC PRESS Office, by

DEWEY & CO.

"Faith and Confidence"

LIVERMORE, Oct. 1st, 1875.

MESSRS. DEWEY & CO., Patent Solicitors; *Gentlemen*:—Yours of tbe 29th ult. containing my patent to Elevated R. R. duly received, and I bereby return my sincere tbanks to tbe MINING AND SCIENTIFIC PRESS Patent Agency for your promptness and honesty in regard to our business connections. I have received a flood of circulars from Eastern firms, desiring to deal with me, but I have declined any communication with them and prefer, as soon as circumstances will permit, to negotiate with and patronize a bome institution; one in wbicb I bave faith and confidence—DEWEY & Co.

Again thanking you for your promptness in securing my patent, I remain, obediently yours,

WM. H. HARRISON.

HARD ON THE PUBLISHERS.—Some of our subscribers when called upon by our agents insist tbat tbey bave sent us notices tbrough (perbaps) a neigbbor, the postmaster, or a letter, and we bave taken no notice of tbeir orders, for which they feel bard towards us. Now, we never received sucb notices witbout responding to them. *It would be suicidal to our interest to ignore them.* The fact is tbat it too frequently happens tbat people misdirect tbeir letters; too frequently forget to put the right (or any other) kind of stamps on tbeir letters; they too often send a copy of the paper back, wbich may never reach our business office, or if it does reach us, may lack tbe name of tbe town and county in wbicb tbe subscriber lives, in wbicb case we cannot (if we have his name) tell what part of our list to find it, to cross it off or change it, without looking over some 10,000 names. Postmasters and their clerks make omissions and mistakes as well. ☞ Wben you have business with tbis office remember postal cards and letter stamps are cheap, and ask no one to do that which you can well do yonrself. tf

THOUGHTLESSNESS.—Persons sometimes return their paper, marked "stop this paper." Tbeir name being pasted on tbe sheet they tbink tbat is all we need to be able to cross their names off. Now tbat is tboughtlessness. Your P. O. address is needed as mucb as your name. We bave tbonsands of names arranged only according to locality. Our mailing clerk does not know where everybody lives.

"SPEAKS WELL," ETC.—We would return tbanks for an exchange and back numbers of tbe MINING AND SCIENTIFIC PRESS, publisbed by Dewey & Co., of San Francisco, Cal. It is a well edited, interesting, and valnable journal, and speaks well for our Pacific neighbors.—*U. S. Milling and Manufacturing Journal.*

BOUND VOLUMES of the MINING AND SCIENTIFIC PRESS from Jan. 1st, 1864, are for sale at tbis office at $5 per volume, two volumes a year. Unbound at $3 per volume.

SAN FRANCISCO, SATURDAY, NOVEMBER 25, 1876.

VOLUME XXXIII. Number 22.

Asbestos and its Industrial Uses.

Asbestos is a mineral fiber composed of silicate of magnesia, silicate of lime, protoxide of iron and manganese. Mineralogically the name is given to the fibrous varieties of tremolite, actinolite and other varieties of hornblende, excepting such as contain alumina, and also to the correspondiag mineral pyroxene. It exists in vast quantities in the United States, in various parts of Great Britain, Hungary, Italy, Corsica, and the Tyrol. To various kinds of asbestos have been applied the names "mountain leather," "mountain cork," "amianthus," and "chrysotile," and certain other minerals having characteristics resembling those of asbestos are described as asbestoid, asbestiform, and as lamellar-fibrous. Without entering into any description of these species (for we have to deal only with asbestos proper in considering its industrial applications), we may at once note the chief characteristics upon which the value of the mineral depends. And these are, first, its indestructibility by fire and its insolubility (except for a few varieties) in acids; secondly, its peculiar fibrous quality.

The material is obtained from the mines in forms ranging from bundles of soft silky fibers to hard blocks. The blocks may be broken up and separated into fibers, which, like those naturally obtained in that state, are extremely flexible, admit of great extension in the direction of their length without cracking, are greasy to the touch and very strong. The fiber obtained in New York and Vermont varies in length from two to 40 inches, and resembles unbleached flax when found near the surface, but when taken at a greater depth it is pure white. Upon the length, flexibility, and strength of the fiber the value of the asbestos depends. The engraving, Fig. 5, (shown as also Figs. 3 and 4, on page 353) is drawn from an exceptionally fine piece, and exhibits the fibrous structure very perfectly. The fragment is 43¼ inches long, 7½ inches thick, and 21 inches wide, and weighs 114 pounds.

It is a curious circumstance that although the valuable qualities of asbestos have been known since time immemorial, it is only during very recent years that the mineral has been extensively used. Its employment among the ancients was confined to the manufacture of an incombustible cloth in which the bodies of the dead were cremated, and of napkins which were cleansed by throwing them in the fire. We find record of its employment as lampwick and for fireproof gloves and clothes for metal workers and firemen. Not very long ago we learned of its entering into a peculiar quality of wall paper made in Rome, Italy. With these few exceptions—and in no case has any of them risen to the level of even a minor industry—asbestos has occupied the position of a mineralogical curiosity, a product reasonably certain some day to find its place in human economy, but nevertheless one which inventors seemed systematically to overlook.

The *Scientific American*, from which these facts are taken, says it is to Mr. H. W. Johns, of New York city, that the credit of first using asbestos for industrial purposes on a large scale is due. Some years ago that gentleman invented a cement in which one of the ingredients was asbestos. Asbestos, however, despite its abundance, was then exceedingly difficult to obtain. It could be purchased only in small quantity at a high price, and certainly offered no very promising prospects of an adequate supply should a large demand for the cement be realized. Nothing daunted by this scarcity, the inventor advertised his cement widely, and the result of his advertisements was not merely an augmented sale of his invention, but an avalanche of letters from all quarters of the globe, in which the writers mentioned deposits of asbestos in their vicinity and offered supplies. Thus, ere very long, Mr. Johns became possessed of abundant facilities for obtaining any quantity of the mineral, and was free to proceed with the experimenting which led to the other and more important utilizations which we are about to describe.

In a little volume which has been compiled from patent office records, we find over 300 patents for roofing compositions, and probably this number is much below the total of this class of inventions. In all these compounds, there is a general sameness, due perhaps to the presence of gas tar and various conglomerations of gravel, resin, paper, felt, cement, and chemicals in the large majority. From all these, the asbestos roofing differs: not merely through its containing asbestos, but through its composition independent of that material. From Fig. 3, which is a section of the asbestos roofing, its construction will be understood. *F* is a layer of asbestos-coated felt; *A A* are layers of acid and waterproof composition into which asbestos enters. *C* is a canvas, and *M* a manila lining. These materials are compressed to a sheet resembling leather, about one-tenth inch in thickness, and produced in continuous rolls about 40 inches wide, each roll containing 200 square feet. The weight is 50 pounds per 100 square feet, or about one-tenth that of gravel roofing. The manner of applying the rolls to the roof is shown in Fig. 1, the operation consisting in merely tacking the fabric to the boards. This is done with equal facility on either flat or steep roofs. The last process is to go over the laid roofing with a prepared coating of suitable color. This is made of asbestos in a flocculent state, mingled with silica paint body and other ingredients. It is applied with a brush, and forms an elastic waterproof felting. For large and important city edifices, an asbestos concrete may be applied by means of a trowel and in lieu of the above coating. The advantages claimed for the roofing are that it forms a water and air tight smooth surface, which is a good non-conductor of heat, and is practically a resistant of fire; also that it is adapted to all climates, and is unexcelled in durability and cheapness by tin, slate, or shingles, of the qualities ordinarily used.

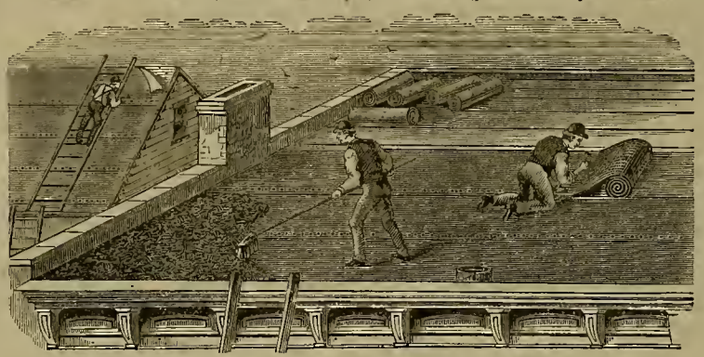

Fig. 1. LAYING DOWN ASBESTOS ROOFING.

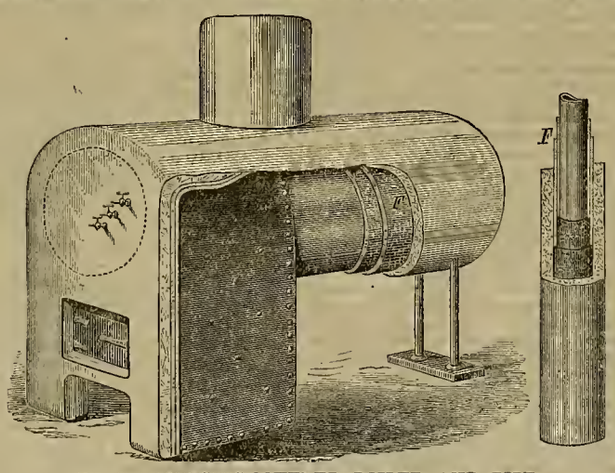

Fig. 2. ASBESTOS-COVERED BOILER AND PIPE.

The second application of asbestos to which attention may be directed is as a covering for steam boilers and pipes. For this purpose it is prepared in various ways. A cement felting, composed of asbestos and a cementing compound, may be used like mortar and applied directly to the pipes, forming an excellent fireproof non-conductor of heat. It is improved, however, as a covering by the addition of an asbestos lining felt, which is a strong sheathing, to one side of which is attached a layer of flocked asbestos. This is applied, say in two turns, directly around the pipe, and the cement laid on outside. Each layer of asbestos thus forms a sort of air chamber, which adds greatly to the insulating capabilities of the cover. At the same time the felt admits of the expansion of the pipe and also serves to protect hair felts, when the same are placed over it, from charring and other injurious effects of heat. An asbestos lined hair felt is likewise manufactured, which is especially suitable for covering marine and locomotive boilers. The mode of applying the insulating material will readily be understood from Fig. 2, which shows both a boiler and a portion of a steam pipe, covered, *F* being the felting. We are informed that the materials are very easily and cheaply applied, that the pipes so covered are smaller and neater than is usually the case, and that there is no danger of the envelope cracking through the expansion of the pipes. These feltings were subjected to severe tests at the New York navy yard in 1874, which they successfully withstood, showing the highest degree of efficiency as non-conductors of heat.

Asbestos steam packing offers in itself utilizations as important in some respects as any other here mentioned. Ordinary packing in engines is obliged to contend with an elevated temperature, moisture and friction, all agents tending towards its destruction. From the testimony of those who have used asbestos prepared as below described, it appears wholly indifferent at all times to temperature and moisture, while its self-lubricating qualities protect it greatly against wear due to friction. The mode in which the packing is made is shown in Fig. 4. The long flexible fibers of the asbestos are securely covered by a thin braid, forming ropes from three-eighths to two inches in diameter, which are put up in coils of 50 pounds each. It is especially suited for use in cases where the effect of high pressure steam is to be met. We are informed that it has been employed without removal on an ocean steamer which sailed over 90,000 miles, and in another case on a locomotive which ran over 50,000 miles, in both instances showing but slight effects of wear, and necessitating no stoppages.

As a paint body, some varieties of asbestos, through its capability of being reduced into almost impalpable powder, has been found excellently adapted. It is exceedingly tenacious, and so renders the pigments not liable to chalk, crack, or scale, while it possesses superior covering qualities. Less coloring matter is required in the manufacture of these paints than in any other, and they are prepared and sold by Mr. Johns ready for immediate application by the brush. The ingredients are simply the best linseed oil and colors, with the asbestos body; and the paints are not offered as strictly fireproof, although it is believed that they will resist fire after drying much better than ordinary paint. They are made in all shades, and are especially well suited for outside work, such as railroad cars and bridges, walls, fences, etc.

Lack of space prevents our describing, in detail similar to the above, the many other productions into which asbestos enters. Of the more important of these we may mention asbestos cements (fire, acid, and water proof) for linings and fillings for iron columns, floors, and for slate and other roofs, for cementing steam and other joints, fire clay retorts, etc. A fireproof coating is also made for wooden structures and shingle roofs and for surfaces not exposed to the weather, which are liable to ignition. This is applied with a brush, and may be subsequently coated with asbestos paint. Asbestos board is made from pure asbestos in flexible sheets of various sizes and thicknesses, forming a valuable covering for locomotive boilers, and for flat packing, gaskets, etc., and as a protection for all surfaces exposed to fire. Asbestos paper is used for lining cloth, fire-screens, etc., and for filtering acids. Asbestos thread may be woven into fabrics, and an asbestos lubricator is manufactured, designed for heavy machinery, wagon axles, etc.

All these varied applications are the result of continued experimenting and investigation on the part of the inventor, a labor which has lasted since 1867, and which is still in progress. That they are of a high degree of value and utility may perhaps best be judged by the rapid increase which has been felt in the demand for asbestos products, and by the excellent results which actual employment has demonstrated them capable of yielding. Any further information will be cheerfully given by Thompson & Upson, exclusive wholesale dealers for the Pacific coast for *H. W. Johns'* patent asbestos material, No. 5 First street, San Francisco.

COPPER.—From James Lewis & Sons' Liverpool, copper report of November 1st, we take the following concerning prices of copper: On Sept. 30th, Chile bars were quoted at £72 10s, but a few days after the market improved considerably and an advance of £3 to £4 was obtained. It has since been tolerably steady at a further advance, with a large business, as about 9,000 tons of bare have changed hands during the month at from £72 10s to £77, according to brand and position. Latest quotations are: bars £76 10s to £77 for good ordinary brands; £78 to £78 10s for special brands, and £15 to £16 for ore and regulus. Chile exports for year to October 16th, are 44,488 tons fine. Stocks of West Coast produce are equal to 14,649 tons fine against 14,107 on the 1st of October.

THE water after it leaves the condenser of the Consolidated Virginia pan-mill engine ranges in temperature from 120 to 130 degrees. With this heat it flows out into the reservoir, where it is spread out to cool, and is then returned to the condenser and used over and over again. It makes a circuit of several hundred feet ere it gets back to its work.

Lead has advanced in Liverpool to £21 10s to £21 15s for good ordinary brands, and £21 to £21 5s per ton for Spanish soft silver.

Antimony is worth in Liverpool £54 to £55 per ton for French Star Regulus.

CORRESPONDENCE.

More of the Quartz Mines of Madison County, Montana.

[From our own Correspondent.]

After leaving Virginia City, the mines near Sheridan, Iron Rod and Silver Star were visited and examined with a great deal of interest.

A Remarkable Fact.

It is a matter worthy of record in these days of heavy assessments, that with the single exception of one or two claims that had had no ore worked, or had not cleaned up, every mine at these points to which attention was called was self-supporting or paying fair wages, and in some instances yielding handsome dividends.

Tha Broadgauge,

Mill Creek mining district, and situated at Brandon City, the property of Mssrs. Zinn & Cisler, was discovered four or five years ago while sluicing in placer diggings. At the greatest depth attained it is by no means well defined, but shows a width from wall to wall of 100 feet, with veins of gold-bearing quartz from two or more feet thick, running parallel, with some chambers of ore widening to 25 feet, paying near the surface from $7 to $30 per ton, and at present depth, about 90 feet, averaging about $8 per ton. There is a 20-stamp mill in connection with the property, rnn by water power, the wheel underground, so that no interruption occurs in winter. The quartz is easily mined and crushed, 30 tons on an average being worked per day, and the whole cost for mining, hauling and milling not exceeding $2.50 per ton, which gives a net profit of something upwards of $5 per ton.

This is one of the paying mines of the county, all expenses for development and for the erection of mill having been paid from the products of the mine. A tunnel is now being driven to strike the ledge at about 400 feet from the surface, which will probably lay bare a better defined lode.

Some work was done 10 years ago on

The Branham,

Owned by Mr. Cisler, the ore paying from $40 to $60 per ton. The Sam Hauser, owned and worked by the same, has a crevice from two to three feet, and a very narrow vein of quartz that runs in places as high as $2,000 psr ton in gold; in the widest part, where it is only eight inches, it works about $100; present depth, 30 feet. Another ledge, one-quarter of a mile from the mill, on which but little work has been done, shows ore which is now being extracted that will probably work $50 per ton. The Last Chsnce, situated near the Broadgauge, and owned by Messrs. Frank & Smith, has been recently opened at several points, exposing an apparently well defined vein from eight to twelve inches. No ore had been worked; bnt what was on the dump was valued by the owners at $20 in gold.

From what has been said above, if it pays only $10, it can he made profitable to work.

The Geo. Pfohl Lode,

At the head of Bivin's gulch, eight miles from Laurin, the property of Messrs. Shoals & Spencer, has been opened by shaft to a depth of 20 feet. The vein is from 12 to 15 inches, the quartz believed to average at least $100 per ton, as $100 per month is pounded out in a hand mortar during the evenings. Worked by mill or arastra it might be made to yield handsomely.

In Wisconsin district, eight miles northeast of Sheridan, there is a very promising and well defined lode on which locations have been made to the extent in the aggregate of 8,000 feet. The first location is known as the

Company Lode,

Consisting of 2,200 feet, belonging to Messrs, Noble, Fitch, Baker, Inglis and others of the vicinity, and on which a considerable amount of work has been done, principally by Mr. Noble, with good resulla as the sequel will show, a segregation having been made some time ago in the property.

The Claim of Mr. D. B. Noble,

Consisting of 366⅔ feet on the original location, is located high up on the mountain side, where the snow, when visited, was at least a foot dsep, although none was to he seen at the time in the valley, five miles below. It is well situated for being tapped and drained to almost any desired depth hy tunneling. A shaft had been sunk 100 feet and a tunnel had reached the lode near the same point about 320 feet in length, reaching a depth of 200 feet from the surface, botb of which disclose a width of lode from wall to wall of about six fest, and good bodies of quartz. Granite forms one wall and a species of trap rock the other. No attempt has thus far been made to work the ore for silver, although rnnning below water level in the proportion of $2 in silver to $1 of gold. The whole of the quartz found in the ledge has been extracted, averaging in gold about $20 per ton. If properly assorted, some of it would have worked $1,000 or more. Something upwards of $25,000 have been taken out at this point, paying all expenses for opsning and for arastra, six-stamp mill and other improvements, bssides a living in the msantime, with a nios margin of about $12,000 left in the way of net profits; all of which may be sst down as another fact worthy of notice, particularly in view of the grsat disadvantages undsr which the whole was accomplished.

The Philtips,

First extension east, 625 feet of which is also owned hy Mr. Noble, is well opened and has yielded about 600 tons, averaging $16 each, making in the aggregate about 9,600. Mr. Fitch on the Company lode has taken out probably as much as $3,000. In the same locality, but on a different ledge, Messrs. McCaffrsy & Fishback have taken out several thousand dollars from

The Cliff Lode,

The quartz running in gold from $10 to $45 per ton, althongh hsaring decided marka of heing rich in silver also. It is opened hy two tunnels along the veiu of 150 feet each; crevice, from one to four teet. When visited, some very rich ore was coming from the mine. On the opposite side of the canyon Capt. Means was reported as having made a recent discovery of exceedingly rich gold quartz, which he had christened the Plymouth Rock, running about $200 per ton.

The Iron Rod Mine.

Situated at a place of the same name, the property of Messrs. Dahler, Largey & Co., of Virginia City, is one of the oldest and best developed of the district. The deepest shaft is 400 feet, and a tunnel has been run striking the ledge and following it 600 feet in the direotion of the main shaft, hut attaining greater depth by about 50 feet, with the view, I presnme, of draining the mine, as it is not at present worked on the lower level in consequenoe of striking a large body of water. Trap is found on the hanging wall and granite on the foot, the usual formatiou of Silver Star district. The pay vein varies from ten inches to four feet, and consists of a rather high grade gold quartz that averages, in their mill, $50 per ton. The general impression is, that it pays them well. The mill is run hy water power, and consists of 12 stamps, with six more to be added. They are now putting up a boiler for the purpose of using steam when found necessary.

The Hudson, at the same place, owned by Messrs. Dahler & Largey, was opened a year ago hy a shaft, disclosing a vein nesr the surface of six feet in width, widening to 37 feet at the depth of 50 feet—surface ore paying $7 per ton, hut, as greater depth was reached, rising to an average of $20, or upwards. Another shaft has since been sunk 500 feet from the former, to the depth of 70 feet, where the vein is six feet thick, and showing richer quartz than any hitherto discovered.

The same gentlemen are also working the Broadway, which contains a large body of low grade ore. What it pays or how much was not learned, but it is altogether probable that they find it profitable, as they are not the class of men, I shonld jndge, to continue long iu a losing speculation.

There are several other mines that have been worked here to a greater or less extent among the number worthy of mention is the

Golden Clipper,

With ore running about $75 per ton, and spoken of as one of the best mines of the district. Yon will probably recollect that in some correspondence from El Dorsdo county, Cal., last summer, a statement was made by a miner of considerable experience that where a break occnrred in a ledge, he invariably drifted to the left, and has always succeeded in finding it. On inquiry at Austin, Nevada, his experience was confirmed for that locality. But here an instance was found where they drifted to the right, which proves that it is owing to local causes, or something of the kind, as there are no exceptions to a general law of nature.

The Aurora Mine,

Silver Star district, and the property of Mr. O. A. Herneman, is opened hy three shafts and two tunnels. The greatest depth at present, 70 feet. One of the tunnels now being run along tbe ledge will attain a depth from surface of 800 to 900 feet. At one point it is from seven to eight feet in width. The whole of the quartz is extracted and worked without assorting, yielding an average of $50 per ton, and some taken from the foot wall paid as high as $100 in gold. Hanging wall a hard black trap and the foot wall is gneiss. In connection with the property is a six stamp mill, hut for want of proper facilities for saving the silver, no attempt has been made (further than laying aside the tailings tor future reduction,) to work it for this metal, though giving assays from $250 to $1,200 per ton. The silver ore oonsists of chloride, black sulphurets, stetefeldtite, carbonate of lead, and probahly some other varieties. A clean-up of 250 ounces had just been made—not the only one likely, as the mine is regarded in the neighborhood as one of the most profitable in the district.

Dr. Everts Mine,

At Silver Star, and owned by Messrs. Mayer & Wilson, shaft 130 feet deep, and a tunnel along the ledge, which varies from one inch to four feet in width, is now about 600 feet in length. All the quartz worked and unassorted averages from $28 to $31 per ton in gold. The rock is reduced in arastras, and is paying them handsome profits.

The Governor Hayes,

Owned by Mr. James Slaven, a four foot lode with at present one foot of quartz. It is a late discovery, with shaft only 20 feet. It prospects about $50 psr ton. Was tssting some in an arastra, but had not cleaned up.

The future of Governor Hayss, (it is now Novsmber 3d,) will be detsrmined long before this article can go to press.

The Wingard,

Belonging to Messrs. Fullhart & Siegchrist; greatest depth from surface, hy tunnel, from 125 to 150 feet; works from $60 to $100 in gold; lying between the trap and gneiss. About $3,000 taken out in the past few months. The mine is paying them well. A. C. K.

Silver Star, Nov., 1876.

Mines in Amador County.

EDITORS PRESS:—As I promised you, I will give you a sketch of mines and mining in Amador county. If you remember aright I wrote for your journal some three years ago a series of letters entitled "Mines and Mining of Plumas and Sierra counties." If I mistake not, there has never been a question raised as to the reliability of those letters from your "special correspondent." As I said then, and reiterate now, "our capitalists do not study their own interests." There is no richer field for speculation than in Amador county. Her fields of golden ore lie unharvested for want of capital. Men of means can be seeu hurrying along California street investing every dollar they can command in the silver mines of Nevada, an adjoining State, when they have fortunes iu gold lying at their own doors. I will cite you to a few instanoes wherein men have prospered by investing in mines nearer home than Nevada. Alvinza Hayward a few years since was what we might term a poor man. If I am rightly informed, he obtained possession of what now is known as the

Phœnix Mine,

In the pleasant little town of Plymouth, situated about three miles north of Drytown. When Mr. Hayward purohased this mine it cost him but a little more than $10,000. What is it worth to-day? With a 100-stsmp mill—which it has—it could not be bought for

Five Million Dollars.

Mr. Hayward had brains enough to secure the "golden calf" instead of the silver one when he found it lying at his door. The first word one hears on the street is this: "Is it on the stock board?" Of course it is not, for it is not incorporated. The Gopher mine was purchased by capitalists in San Francisco. This mine was purchased for the small sum of $10,000. To-day its valne, with its 40-stamp mill now in course of erection, is $800,000.

The Alpine mill, for some unexplained reason to your correspondent, has closed down. The Oneida, I believe, haa also closed down. What the objects of the owners are is best known to themselves, but I know for a certainty it ia not for want of rich ore.

I now come to the Potosi, Marylaud and Dan Worley mines. The Potosi company sunk a shaft to the depth of 265 feet, had an overshot wheel 50 feet in diameter, a three and one-half mile ditch with the water right to Dry creek, and a 15-stamp mill with ore that would average $100 per ton; snd with all these advantages the company closed dowo, and their mill and mine passed into the hands of a Mr. Miller for taxes, yet its real owners are the Hinksons, who allowed the sheriff to sell for taxes in order to get full possession of the mine. Unlike the

Dog in the Manger,

They are willing for some one else to go on and work the mine who has more capital than they have, all of tbem being poor men. From the surface down the ledge will average seven feet in thickness, and some of the ore will crush as high as $1,500 per ton; and still this mine—one of California's golden treasures—lies dormant for want of capital to pour its hidden wealth into the public treasury. MAXIMILIAN.

The Planet Vulcan.

A Month's Observation Required.

EDITORS PRESS:—Notwithstanding the very great uncertainty regarding the period of Vulcan's evolutiou, yet observations appear to have been directed more to special dates than continuously for at least the probable period of its revolutions, even to the extent of 42 days, rather than 20, 21 or 28 days, which have been variously assigned. A little reflection will, I think, show the necessity for this, to be sure of not missing the planet in some favorable part of the orbit, not necessarily in transit. We should have continued observations for 42 or even say 45 days, because 42 days has been the latest period assigned, and would also cover either of the shorter periods in case either were approximately correct. It is, of course, to be regretted that these observations have not been made long since, and in California especially, during our dry seasons. Without such continued observations, the chance of detecting it is very greatly diminished by the lapse of so many years since the supposed observation o March 26th, 1859; hnt still no astronomer should be discouraged if he has the leisure to make suoh observation, or could arrange with others to divide up the time, night and day, in different parts of the world. Supposing each observer only took half an hour at a time, within a range of 15 dsgrsss, say, from the sun. Such observations have very little reference to any reasonable expsctation of seeing a transit, as the earth and plsnet probably would only be relstively favorables, as Professor Hind wrote in 1860, "between Maroh 25th and April 10th, or September 28th and October 12th in that and every year," but he regardsd that there was great probability of its being detected when apparently remotest from the sun. The period thus assigned was under 20 days for the planet's revolution, making 18 periods and five or six days over annually of our years. This of course would give entirely different results eaoh year, and we should also have to add the earth's motion during the same period, so that in fact, with every completed revolution, the planet would really have exceeded it.

Then again, of course if the period was estimated over 20 days, even up to 42 days, it is manifest, without figuring it out with a table, that even a few hours, or a day only, would give entirely different dates for successive Octobers or Novembers, or any month that might be chosen for observation, and hence complete observations would require, say a whole month, and snpposing that was faithfully observed, the weather permitting, and yet nothing detected, the observation should be pursued to the longer period of 42 days. Our weather is, of course, now too changeable to admit of snch continued observation, but there may be southern olimates favorable; or our own again in the next dry season. Bnt success might attend observations whenever weather permitted, rf it so happened that the time was acoidentally favorable. The real point in the matter now is, that the uncertainty of the period has thrown it out of all oalculation in the lapse of so many years.

I trust, therefore, that some concerted action will be taken by astronomers covering the longest probable period, say 42 days of observation, where the season is favorable, that the question of an intra-Mercurial planet may be determined positively, one way or the other. I cannot at all concur with the very limited observation that astronomers of late seem to have oontented themselves with, which really afforded next to no chance of discovering the planst, and still less if the observations were solely directed to the possibility of transit, instead of within the range of the probable orbit; perhaps before sunrise our achromatic telescope of three inches apertnre, with proper rockwork adjustment and ordinary good stand, would be ample for snch purpose, although the planet probably is not larger than about half the size of Mercury. Professor Davidson's recent letter detailing his special observations for a limited time, induced me to throw out this suggestion of continuona observation being the only certainty we can obtain. A. F. G.

Mining Between Liberty and Lowell Hills.

A large belt of mining ground is located between Bear river and Steep hollow, joining the Raymond claim on the south and Swamp Angel on the north, and is a continuation ot the Blue lead, rnnning direct north from this place to Omega, Blue Tent, etc., and embraces 412 acres of mioing ground. Althongh no direct mention has been made of these mines heretofore, the owners have nevertheless been keeping pace, according to their means, with the balance of the mines in this district. The rimrock raisss higb on both sides of the chanuel, and being of a hard natnre, together with the long distance tnnnels have to run to tap the bottom of the channel, makes it an expensive and slow process for the present owners, the majority of whom have to rely on outside labor to keep up expenses or assessments on their share of tbe mine.

The following is a list of the olaims, commencing at the Swamp Angel and running south:

East New York, containing 80 acres; length of tunnel required through bedrock, 1,200 feet, 150 feet of this being now completed.

Wild Cat; this mine embraces 90 acres, requires 1,500 feet of tunnel, completed 360 feet.

Wilkinson company have 20 acres; length of tunnel required 1,000 feet, now completed 550 feet.

Lsvev company; this company joins the Raymond claim and contains 122 acres, required 460 feet of bedrock tunnel, 260 feet of which is now completed.

Owing to the richness of this ground it will sesm a mystery to some how it is that capitalists have not gobbled it up before this time. The thing is that the working olass of miners now owning good claims have made up tbeir minds to settle in this country, having something substantial to rely on. The idea of selling out for a trifle and returning Esst for a home is gstting played out among the laboring olass.—*Dutch Flat Forum.*

PAVED WITH SILVER.—A *News* reporter yesterday took a handful of the gravel thrown up on Main street in laying the new water pipes and had it assayed hy Ross, the well known assayer. The result was, gold $2.25; silver, $3.75; total, $6 per ton. This sample was snatched at random from the long pile of debris thrown up from the trench at the side of the street, opposite the *News* office. Main street being macadamized with low grade silver ore from the waste dumps of the mines, this assay is no matter of snrprise. Better assays than that could easily he obtained from the middle of the street.—*Gold Hill News.*

SCIENTIFIC PROGRESS.

A Geological Congress.

The geologists from Europe and Amsrica, who were present at the international exhibition at Philadelphia In 1876, fonnd there important collections of geological maps and sections, with rocks and organic remains from various regions of North and South America, as well as from many countries of Europe, and they have become deeply impressed with the great advantages to be gained hy their comparative study.

Another opportunity for comparative study will occur at ths international exhibition to be held at Paris in 1878, and it is proposed to invite to that end governmental geological surveys, learned societies and private individuals throughout the world, to send to Paris such collections as will make the geological department of that exhibition as complete as possible.

In order to take advantage of the collections which may thus be brought together, it is, moreover, proposed to convene an international geological congress, to be held at Paris at some time during the exhibition of 1878, and to make that congress an occasion for settling many disputed problems in geology. In accordance with this plan it is proposed that the geological department of ths international exhibition of 1878 shall embrace:

1. Collection of crystalline rocks, both crystalline schists and massive or eruptive rocks, including the so-called contact-formations and the results of the local alteration of uncrystalline sediments hy erruptive masses. In this connection are to be desired all examples of organic remains found in crystalline rocks, including eozoon and related forms. These collections shall moreover comprehend all rare and unusual rocks of special lithological, mineralogical and chemical interest, examples of ore deposits and of veinstones of all kinds with their incasing rocks. As far as possible these collections should be limited to specimens of a size convenient for examination, and be accompanied with sections prepared for microscopic study. In the arrangements of all these materials regard should be had to their natural associations rather than to theoretical notions or artificial classifications, so that they may be studied not only petrographically but geognostically.

2. Collections illustrating the fauna and the flora of the paleozoic and more recent periods, particularly of such horizons as present a more critical interest to paleontologists from the first appearance or the disappearance of important groups of organic forms. It has appeared to the committee named below that the organic remains of the Cambrian, Taconic, or so-called Primordial strata merit especial attention in this connection.

These various collections should be explained as fully as possible by labels, catalogues, monographs and maps.

3. Collections of geological maps, and also of sections and models, especially such as serve to illustrate the laws of mountain structure. In the geological maps regard should be had to various questions which deserve the special consideration of the Congress, such as the scales best adapted for different purposes, the colors and symbols to be used, and the proper mode of representing superficial deposits conjointly with the underlying formations. A discussion of these will prepare the way for improved general geological maps of the continents.

In pursuance of the above plan the American association for the advancement of science, during its annual meeting at Buffalo, under the presidence of Prof. William B. Rodgers, unanimously adopted resolutions favoring the plan, and ordering a circular issued calling upon all geologists to contribute to the end desired. All those interested in this project are invited to communicate with any one of the following members of the committee: Prof. T. H. Huxley, London, England; Dr. Otto Torell, Stockholm, Sweden; Dr. E. H. Von Baumhauer, Haarlem, Holland; Dr. T. Sterry Hunt, Boston, Mass., U. S. A.

Forests and Climate.—*Iron* says that important aid towards the settlement of a somewhat vexed question, having important economic and scientific bearings, is being rendered by the conservators of Indian forests. In Berar, in the center of the peninsula, there are upwards of 4,000 square miles of woodland, of which 660 miles are reserved by the government for State purposes. Not long ago, however, the whole was at the mercy of the natives, as by far the larger portion is still, and the wood was recklessly destroyed, while perhaps still greater destruction was effected by the frequent conflagrations, occasioned by carelessness on the part of charcoal burners and the prosecutors of the other native industries connected with the forest. Besides taking the 600 acres of reserve under their peculiar care, the authorities have exercised a rigid surveillance over the free forest for the purpose of suppressing the fires. The result has been that throughout the entire region natural reproduction is making steady progress; and the change in the features of the country thus occasioned is inducing remarkable climatic changes. There is a markedly increased rain-fall, which has modified the formerly extreme heat of the hot season, while in the cold season frosts are becoming common in open tracts. Although, as regards the reserve, water is much more plentiful than it was a few years ago, it is well worth observing, for its bearing upon the floods in southern France and elsewhere in Europe, that the sudden rise of the rivers which used to occur regularly after the rainy season, has, since 1871, occurred later and with less severity year by year. The cattle thrive better, and are less liable to disease than heretofore; but there is one drawback, that the reserve is becoming more unhealthy, from an increase of fever and dysentery, a natural result of dense and extensive forests in a tropical country.

Notes from the French Academy.

At the late meeting of the French Academy of Sciences the following topics were presented:

On Weather Insurance—A tornado recently occurred near Orleans, France, destroying some $40,000 worth of property, and doing great damage to crops. M. Faye suggests that weather insurance companies, guaranteeing losses in such cases, would be useful institutions.

On Vitreous Rocks.—All types of vitreous rocks are related in their elementary composition to groups of crystalline rocks. It would appear at first sight that they might be scoriæ of the latter and might be reproduced by fusion or vitrification of the latter. Experiments in this direction have, however, failed to realize such a result, because natural vitreous rocks are hydrated, and often contain volatile matter. On the other hand, it appears that the crystalline rocks may, in many cases, be regarded as the result of devitrification of vitreous rocks; and recent expsriments made at the potteries of St. Gobain, and Choisy-le-Roi, by Professor Fremy, tend to establish the fact. The vitreous rocks were first melted in order to eliminate the volatile matter, and then submitted to a high temperature for eight days. Obsidian and retinite thus treated have yielded substances which show that if the treatment were sufficiently prolonged, trachyte and porphyry might thus be artificially produced.

On Examination of the Sea Bottom from Balloons.—By M. Moret.—The author and the aeronaut Dnrnof recently made an ascension at Cherbourg, to the hight of 5,440 feet, and noted that at that elevation the bottom of the sea was visible even to the minutest details, although the water was over 250 feet in depth. The submarine rocks and currents were so clearly discernible that a map of the bottom could readily be plotted. It is suggested that this use of balloons would be of great value in marine surveying, as affording accurate plans of shoals, reefs, etc.

On a New Method of Detecting Artificial Coloration in Wines.—By M. Lsmattina.—In order to recognize artificial coloring in wine, the simplest process is to mix 3½ fluid ounces of wine with half an ounce of peroxide of manganese, coarsely pulverized, and to shake the mixture for ten or fifteen minutes, afterwards filtering through a double filter. If the wine is pure, it passes colorless; if colored artificially it keeps its color. When pure peroxide of manganese is employed, this process is applicable to all coloring substances artificially introduced, even fuchsin. When, however, the wine after filtration appears yellowish, it is because the oxide employed contains iron. In such cases it is necessary to use alcohol, acetic acid and ammonia in order to determine the presence of fuchsin.

Theory of Luminous Flames.—Dr. Karl Heumann considers the circumstances that a gas flame does not actually touch the edge of the burner, nor a candle flame the summit of the wick, and that a flame never comes in close contact with a cold body, is due to the fact that heat is conducted away by the solid body. The flame gases are cooled for a certain distance below their ignition point, and the flame is consequently extinguished within this region. The distance between a gas flame and the burner is considerably increased if the inflammable gas or vapor streame out under a high pressure, or ie mixed with e large amount of some non-inflammable gas. This phenomenon is due not merely to the cooling action of the gaseous stream and of the external air, but to the fact that the speed of the issuing gas stream close to the burner ie greater than the speed of the propagation of ignition. When other influences are not essential, the flame begiue in that section of the issuing gas current where its speed equals the speed of the propagation of ignition. Hence this speed of propagation for different gases and vapors may he experimentally ascertained. In case of solide and liquids of a combustible nature the same speed may also be readily found by experiment, and the results may he regarded as relative numerical expressions of the dengerous character of the combustibles in question.—*Liebig's Annalen der Chemie.*

The Phonetic Telegraph.—Prof. Bell's phonetic telegraph, lately mentioned in this column, is, from all accounts, a very wonderful thing. We have seen no minute description of its mechanism; but the results of its use are established beyond peradventure. Long conversations have been held between the Professor and other persons who were several miles away, and it is said that the audible sounds were transmitted through as much as 1,000 miles of connecting wire. There can be little doubt that telegrams will soon be transmitted in this way.

MECHANICAL PROGRESS.

Improvement in Tube Making.

Several improvements in the manufacture of iron and steel tubes have recently been proposed. The nature and novelty of the improvements invented by Mr. R. A. Malcolm, of Glasgow, as reported hy the London *Mining Journal*, consist in the arrangement of two horizontal rollers carried in bush-bearings in side standards, and geared hy wheels on one end of their shafts, so as to revolve at the same rate, having a bevilled flange or rim on the reverse ends of each, and having the other plain or cylindrical end made so that it can pass in through a hole in the side frames, either clear or as in bush-bearing, so that these rollers could each be traversed longitudinally in reverse directions, and set with their flanges to any desired width to suit the plate to be gripped and drawn in and be scarfed hy the bevilled edges when that is desired, so that these rollers would draw the plate in always in the center of the machine through a hollow conical mandril or bore placed close up to the back of the rollers with its under inner surface lying nearly horizontal or tangential to the upper surface of the upper roller, the front end of this mandril which receives the plate from the rollers being curved nearly to the shape of the two rollers. The novelty of the second part of the improvements consists in the arrangement of a pair of horizontal and vertical geared rollers, with nearly semicircular grooves in them, working opposite or with their peripheries on each other at the same speed for drawing the tube ont of the furnace, and welding the joints with an internal mandril passing through and between both pairs of rollers, over which the joint is welded and the tube accurately shaped into the cylindrical or tubular form, and with its long retaining stem carried forward and fixed in the usual holding or retaining block in front of the whole length of the tube to be delivered on to it, and which is disengaged from its retaining block and re-engaged after the withdrawal of each tube; and for the clean and perfect forming of tubes in the welding rollers, the first pair of rollers is made slightly oval in the direction of the joint formed by the two semicircular grooves in the rollers, the second pair being more nearly spherical or slightly elliptical in the direction of their joints at right angles to the former, removes all scalss, and the streaks usually formed by the joints at the grooves of the rollers when made in the usual manner, thus delivering a perfectly round and much smoother tube than hitherto. The nature and novelty of the third part of the improvements consist in cutting the welded tubes into lengths, after being welded thus, hy a thin revolving steel disc, with or without teeth, secured between two large collars on a short portable screw spindle, much in the same manner as that of circular saws, working on centers passed through the two side standards of a strong frame with stey-rods above, the centers being screwed and secured on each side of the standards by jamb nuts, and with turning heads on them outside, so as to accurately adjust the centers for the spindles of the disc, cutter, or saw, to revolve steedily, much as the centers of lathes and boring machines, the spindle of the saw being driven by a pinion on it from a large wheel gearing thereinto on an adjacent driving shaft carried on the end of the same, or on a separate frame; also that the saw works steadily although driven at a very high speed. The tubes are quickly and easily cut cold or nearly so by griping them in a pair of broad tongs for the purpose, with long handles and a fulcrum spindle through them in or near their joints which are inserted in open hearings in the top of a standard sufficiently close to and under the breast of the cutter or saw, that the person in using the handles of the tongs operates them as a powerful lever to prese the tube up and forward against the cutter with a turning action, which speedily severs the tube, at the same time squaring and cutting the ends to their proper lengths; or they may be pressed against the disc by means of a screw.

Wooden Steam Boilers.

It is worth while to stop a moment in our progress toward boiler making by machinery, which was recently described in this column, and look at the boiler making at the beginning of the century. An account of wooden steam boilers is given in a "History of the Steam Engine in America," in the *Journal of the Franklin Institute* for October, 1876. These wooden boilers were used in 1800 for the first engines of the Schuylkill water works at Philadelphia, and are described as follows:

The boilers were rectangular chests, made of white pine planks 5 inches thick; they were 9 feet square inside at the ends, and 14 feet long in the clear; braced upon the sides, top and bottom with oak scantlings 10 inches square, the whole securely bolted together by 1¼ inch rods passing through the planks. Inside of this chest was placed an iron fire-box 12 feet 6 inches long, 6 feet wide and 1 foot 10 inches deep, with vertical flues, 6 of 15 inches diameter and 2 of 12 inches diameter; through these the water circulated, the fire acting around them and passing up into an oval flue situated just above the fire-box, carried from the back of the boiler to near the front, and returned again to the back, where it entered the chimney. This fire-box and flues appear to have been at first made entirely of cast iron; then a wrought iron fire-box was made, the flues still being of cast iron; this not being satisfactory on account of the unequal contraction and expansion of the two metals causing leakage eventually wrought iron flues were also put in.

Great advantage was at the time supposed to be gained hy the non-conducting powers of the wood, and also by the vertical flues in the fire-box.

These boilers were used for about two years, but, as might have been expected, it was found very difficult to keep them perfectly steam-tight. Cast iron boilers were accordingly substituted for them in December, 1801, and these remained in use until new water works were built at Fairmount in 1815; and cast iron boilers were used there until 1822, when steam power was given up for water power.

French and American Mechanics.—Mr. L. Simonin, the French mining engineer, writing in the *Revue des Deux Mondes*, of Paris, has, under date of October 15th, given an article to that review entirely devoted to the Centennial exhibition, which he has studied during several months. We translate therefrom a concluding passage, showing a Frenchman's opinion of our progress in the mechanic arts: "The United States stand about on a par with France and the remaining countries in carriage manufacture, that of furniture and glass and porcelain ware. In other branches they have excelled us, and all this despite high wages. We have been, so to say, their teachers, as Italy taught us during the "renaissence" period, and not unlikely they will one day excel their masters, as we subsequently beat the Italians. Venice, Milan and Florence taught us the manufacture of glass, silk and velvet, and we soon excelled them. Are we to have a similar experience at the hands of the Americans? Can we close our eyes to the fact that in the construction of machinery they are already becoming our superiors? Has not their best machinist, Corliss, shipped his steam engines to Europe, especially to the famous spinnery "La Lys" of Ghent? By the thousand the agricultural machines have to he counted which the Americans have furnished to the old world. We find their style of locomotives, and particularly of passenger cars, everywhere introduced. The latter are justly popular for comfort, especially at night, and are in use in England, Switzerland, Germany and Italy, and even ou our French railroads. All over Canada and in Spanish America they have supersseded those formerly used.

Rope Gearing.—Mr. James Durie (Manchester) presented a paper at a recent meeting of English mechanical engineers, on "Rope Gearing for the Transmission of Large Power in Mills and Factories," in which he remarked that the best means of transmitting power from the prime mover to the various machines in a factory had long been a matter of importance to the engineer and manufacturer. The facility of taking small powers off drums to machines by means of belts, and the absence of noise and vibration, led to the adoption in the United States of America of broad leather belts for the transmission of large power from the prime mover to the shafting in factories; and the success which had followed the adoption of these large belts there had led to their being adopted by many users of power in his country. The plan of transmitting large powers by means of round ropes working on grooved wheels had been largely adopted as a substitute for toothed gearing. Rope gearing had been applied to the jute spinning and weaving factory of Messrs. A. and J. Nicholl, at Dundee, as also to the Samunggur jute factory, Calcutta, and the Sealdah mills in the same city, in each case giving great satisfaction. The great advantage of rope gearing was the entire freedom from any risk of a breakdown; when a rope showed symptoms of giving way—and ropes always gave symptoms of weakness long before they broke—the weak rope could be removed and another put in its place at any meal hour or evening. The cost of the maintainence of ropes for transmitting 400-horse power had been found to be $100 per annum, or about $25 per 100-horse power per annum.

The Belgian Cable Towing System.—Says the Springfield, Massachusetts, *Republican:* It is rather remarkable that the prize of $100,000 offered by the State of New York for the application of steam to canals, has utterly failed to bring out a practical device, while the Belgian cable towing system, which was specially excluded from competition for the prize, is in successful operation on the canal. The State awarded $50,000 to the Baxter system, but the company which undertook to introduce that system has become bankrupt, and its effects have been sold under the hammer. The failure was inevitable, from the fact that it costs more to apply the system to a canal barge than it would to build a new boat, thus doubling the first cost of the craft. On the other hand, the Belgian cable towing system has been in successful operation between Middleport and Buffalo, 42 miles, for several weeks. Since the middle of June, two tow boats have towed 250 barges with their cargoes, averaging 200 tons of coal each, against a strong current, without injury to the canal and with satisfaction to the boatmen. On the 9th of July, seven boats, with 1,500 tons of coal, were towed against a three mile current from Tonawanda to Buffalo at three times the speed of double the usual animal power. One boat consumes a ton of coal in 24 hours, and can be operated at an expense of $25 for that time.

MINING SUMMARY.

THE following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

ALPINE.

THE I X L MILL.—Alpina *Miner*, Nov. 18: This mill is rapidly approaching completion. The building is mostly enclosed, the boilers have been set, and the engine will be up next week. The pans, separators, etc., are being placed in position, and the entire work is being pushed by Mr. Arnot, the contractor, who desires to take every advantage of the present fine weather. It is Mr. Arnot's intention to have the mill in working order by New Year's day.

AMADOR.

THE BONANZA.—Amador *Ledger*, Nov. 13: Manon and Bolding's mine at Drytown is opening up splendidly. It was thought at first that the ledge would petar out as sinking was prosecuted. All such misgivings have been falsified. The shaft is now down between 100 and 200 feet, and the ledge better than ever. There is abundance of rock in sight in every part of the mine. In the south drift the ore body shows six feet in width, and on the north side five and a half feet. The rock ranks among the richest. The ten-stamp mill is now at work, and the water supply will enable it to run steadily through the winter. Twelve men are employed in the mine and mill.

THE CROWN POINT.—This is another of the Drytown prospects which begins to loom up as one of the prominent mines of the future. It has recently been incorporated. Actual test has proved the croppings of the ledge to be gold bearing, and of paying grade, from one end to the other. The new 10-stamp mill is being pushed ahead.

THE EAST KEYSTONE.—This is the name given to a claim lately located at Amador City, close to the famous Keystone mine. The principal owners are gentlemen in Sutter Creek and Amador. A shaft is now down about 15 feet, the quartz at the bottom showing three feet in width. The rock prospects from $8 to $10 per ton.

MECHANICS' MINE.—This mine, situated about one mile east of Sutter Creek, has been located for many years, and rock ranging as high as $22 per ton has been taken out. For some cause to us unknown, work was abandoned, and the property has been idle for a long time. Operations were resumed about a month ago. A building has been erected over the shaft and steam power hoisting works have been fitted up. So far operations have been confined to the drainage of the shaft. One hundred feet or more of water yet remains to be taken out.

BUTTE.

GOLD.—Oroville *Mercury*, Nov. 17: On Wednesday night Joseph N. Vera brought down from the Hendricks claim in Morris ravine a beautiful bar of gold to be sent to the mint. It weighed 372 ounces and brought $18.50 per ounce. Total value, $6,882. They have just begun to clean up and this is the first fruits. There is more to follow very soon.

CALAVERAS.

LAMPHEAR MINE.—Calaveras *Chronicle*, Nov. 18: Sinking the main shaft in the Lamphear continues. A depth of 165 feet is already reached, and at the rate of progress now being made the shaft will be down so that the 200 ft levels can be run in a short time. A clean-up at the mill was lately made.

GWIN.—Intelligence from the Gwin mine is that operations are progressing favorably in every respect. The 1200 ft south level is in 50 feet, the ledge showing wide and a fair quality of rock. All the batteries are employed on ore taken from the 1100-ft stopes.

MOUNT TMOLUS.—The new boiler for the engine at the Mount Tmolus is in position and the mill running. There is something like 200 tons of ore on the dumps. Levels are run at depths of 40 and 80 feet and stopes opened. There is an abundance of good ore in sight and it can he got ont fast enough to keep the mill constantly employed.

UPPER COUNTRY MINING NOTES.—Rock of extraordinary richness has been struck in the shaft of the Champion mine at West Point, at 240 feet; ledge 18 inches thick. Everything looks encouragingly at the Josephine. The Mina Rica has out a large quantity of rock but cannot crush for lack of water to run the mill. Rain is anxiously looked for. Shenakre, Hadler & Steger are about to open a hydraulic upon an extensive scale at Big Flat, near West Point. Michael Schmidt is also preparing to commence hydraulicing at Camp Flores.

EL DORADO.

THE DEFIANCE.—El Dorado *Republican*, Nov. 16: This is the name of a mine at Garden Valley, of which Capt. Tuck is Superintendent. A new ten stamp mill has recently been completed upon it, and two clean-ups have already been made which proved most satisfactory. The ledge is an immense one of what is usually termed low grade ore, but equally diffused with gold, and can he worked at a good profit.

ANOTHER BONANZA. — Astonishingly rich developments have recently been made in the Mansfield mine, in Kelsey township, a short distance from the St. Lawrence. This company has been at work quietly and persistently for about three years, and in that time have run over 1,000 feet of tunnel and sunk a shaft 220 feet deep, a large portion of which work has been done in rock as hard as adament, making progress necessarily very slow. Up to the present time about $40,000 has been expended, and at leogth success has crowned their efforts. For some time they have been following a large ledge of medium grade ore for the purpose of determining its extent before erecting a mill. Recently a cross-cut was made in an opposite direction for the purpose of thoroughly prospecting the whole ground, and after running about 40 feet a ledge was cut through about two feet in thickness, fully as rich as that now being taken out of the St. Lawrence. We have seen specimens, 40 or 50 in number, taken out by F. W. Voll himself, one of the principal owners, that are really marvelous in richness, some of the smaller ones being fully one half gold. Present developments would seem to warrant the immediate erection of a mill, but the men interested in it are careful, prudent men, and propose to know everything that is in it first, and have determined to sink down 200 feet more and cross-cut at intervals, before erecting a mill, when, if present appearances are maintained, or even if the mine continues to look half as well, a 40-stamp mill will be erected. With such perseverance as has been exhibited in this mine, in hundreds of others, El Dorado county would soon he the center of attraction in the mining interest.

EXTRA FINE QUARTZ.—*Mountain Democrat*, Nov. 10: On the counter at the Central house are two chunks of quariz which were blasted out of the main ledge on the 800-ft level of the St. Lawrence last Saturday. One of these chunks is about 10 inchee thick, 10 inches deep and 12 inches long; the other is not quite half as large. All through both chunks fine gold and gold-hearing sulphurets are thickly disseminated. We should consider $125 a reasonable estimate of the gold in the large sample. The ledge is about 4½ feet wide at the point from which these two samples were blasted. Next to the foot wall is a solid ledge varying from two and a half to three feet in width. Next to the hanging wall is a narrower strip of about 14 inches. Between these is a strip of slate about six inches thick. Doubtless this will soon run out and the two parts of the ledge will come together. The ore in the two parts of the ledge is exactly alika and equally rich. The whole constitutes one of the finest ledges ever opened in this State.

INYO.

POSTOIS FURNACE.—Coso *Mining News*, Nov. 18: We made a trip to this furnace yesterday, with the foreman, and found everything, so far as their supplies of machinery, etc., will permit, in a fair stage of forwardness. The boiler is set in the brick-work, the engine in place, the pit for foundation of furnace dug, the stone and fire-clay on the ground, and all that is wanted to perfect the furnace for work is some heavy timbers for the furnace and lumber for the building over furnace and engine. These will be to hand in a day or two, when the work will be driven ahead, and it is believed by Mr. Moran and Mr. Rawlings (who has charge of the machinery portion of the work) that they will be ready to commence smelting wi hin three weeks.

LOCAL NEWS.—Coso *Mining News*, Nov. 14: The Modoc mine at all points looks exceedingly well. Modoc village is assuming a most lively appearance, and its people feel sanguine of a bright and permanent future. There have been most successfully worked at Panamint, by Mr. Jacobs, 10,800 pounds of their milling ores, giving additional causes for rejoicing. Already $100,000 have been taken out by furnace process, thereby covering all previous expenses and leaving a small surplus in the treasury, consequently 30 days hence we can fully anticipate a handsome dividend for Modoc stock owners. Minnietta Belle mines are still looking well at all points, but are working only a few men in the mines at present, as whole attention is directed to road building to connect from Panamint valley to mill, mines and the Modoc grade, thereby linking the whole country together. Mr. Jacobs has already three wagon loads of his mill appliances on the ground, and says by January 1st he will have his mill in running order. The first load of Minnietta ore was shipped through Wells, Fargo & Co.'s express today. As soon as the mill commences operation they are confident in paying dividends right along for an indefinite period. R. C. Jacobs, of the Sunrise mill, and James Morton, of the Minnietta Belle, at Lookout, arrived in town last week, and have been very busy in perfecting arrangements for removal of the Sunrise mill from Panamint to the Minnietta grounds. Mr. Jacobs, in his mill process of working the ore without roasting, worked same up to 85 per cent. of the assay value. He is now tearing down his buildings, and has contracted for removal of them and mill to Lookout, besides having made contracts for wood and other necessary material, upon a large scale, for his winter and future supplies. With this mill at Lookout in addition to the two furnaces of the Modoc company, we may confidently look for large shipments of bullion.

NAPA.

THE IRON MINE.—St. Helena *Star*, Nov. 18: We stated lately that work was soon to be resumed on our iron mine, which has for the last two years been the hope of St. Helena in the promise of large additions to her wealth and business, should it prosper as it was hoped it might. The present operation is the taking out of a test lot of 100 tons, by Chas. H. Swain, of the Oakland smelting and refining company, which will use it, should it answer their purpose, not to make iron of, but as a "flux" in the reduction of other metals. They need it in large quantities, and, should it answer their purpose, will use, we are told, 100 tons a day, an amount large enough to require—judging from the progress of the present force—150 men in the extraction, besides a large number of teams in its transportation to the cars. We visited the mine Tuesday. It is located up the canyon, probably two miles above the White Sulphurs, and the scenery up there is wild and romantic. A rude wagon road has been made part way, to a point to which the ore is packed. At the mine, which is well up the mountain side, we found seven men at work, with A. C. Ellis as foreman. He kindly gave us all required information, and appears to understand the business well. He informs us that the ore is of the character known as "hematite." It looks well and improves as they go in. He thinks the ore the best that has ever been found on the coast, but is not yet certain as to the amount. It is soft enough to be easily scraped off with a knife. A large proportion will yield 80 per cent. of iron, and they ship none but what will go, altogether, 50 per cent. They commenced work about the first of the month. Henry McCormick has the contract for packing from the mine to the wagon road. This is done on five horses, which carry each two sacks of 100 pounds each, and make eight or nine trips a day, a removal of four to five tons. The cost of packing is $3 a ton; hauling, $1.50. Total, $4.50 to the cars. The first car-load was shipped down Tuesday, on the receipt of which Mr. Swain will make the first test.

NEVADA.

MINING AT ALLISON RANCH.—Grass Valley *Union*, Nov. 18: The Allison Ranch Franklin mine is looking better then ever. The main shaft is down about 170 feet, and there is a magnificent ledge in the bottom of the shaft, as there is all the way down. A pan, such as is used by the miners in testing dirt, full of the ore, was washed out the other day, and gave in the neighborhood of $30 worth of free gold. That was the result without pounding up the rock. The truth is the Allison Ranch Franklin shows itself to be very rich—fully equal, if not superior, to the old mine. The first level, at 120 feet down, runs north and south with rich rock all through. In 10 or 12 days the new mill will start up, and by running night and day will make room for the ore ready to be taken out. As matters there now stand, it is not worth while to put up any more pay rock on the surface. We do not think a 20-stamp mill will be able to keep the "pay dump" sufficiently clear, and we should not be surprised if a 30 or even 40-stamp mill will be required. The Allison Ranch Franklin is looking well we should say. The Allison Ranch Ford is north of the above named mine and adjoins it. The north drift in the Franklin increases in richness as it approaches the Ford. Hence there is a general desire to get the stock of the Ford mine. There is none of the stock in market, and advertisements from responsible parties wishing to purchase stock have failed to be responded to. It is said by those who know the country there that the Ford is the coming mine of this district.

YUBA MINING COMPANY.—This company, whose property is located on the South Yuba, above Washington, have completed their mill, and it is now running under full headway. The Yuba ledge is a large one, and is worked by tunnels driven into the side of the mountain—no hoisting or pumping being required. We have no figures at hand as to the yield of the rock, but are informed that the prospects are excellent and that the Yuba promises to become a reliable dividend payer before many months. The stock of this company is principally owned in Grass Valley.

CLEAN-UP.—*Foothill Tidings*, Nov. 8: The Centennial mine, a recent prospect out on Osborn hill, had another clean-up at the Orleans mill recently. A crushing of 52 tons of rock is said to have yielded $3,355, or at the rate of $103 per ton, exclusive of sulphurets. Other mines over in that direction promise soon to take out pay rock.

PLACER.

MINING ITEMS.—Dutch Flat *Forum*, Nov. 15: Since our last the weather has continued clear, with cold nights, checking back the water in the mountains above so that the supply in our ditches has materially decreased. The Central claim continues washing day and night. The Elmore Hill claim is working off some gravel loosened by a powder blast, using water a few hours a day. The Polar Star and Southern Cross are washing. The latter is piping into a bank of exceedingly rich top gravel. The Baker claim and the sluices in the Yankee tunnel are ready for water, which will be turned on Saturday. It is not possible, however, to wash continuously for some time to come, even should the company have a full supply of water, as opening a claim, under the most favorable circumstances, is a very slow operation. The Summerset claim owners are constructing a new string of sluices to convey their tailings further down the canyon. The claim will soon be ready for washing. The Cedar Creek company's reservoir above town has been sluiced out and enlarged, so that it will now hold, at least, three times the amount it formerly did. This is an improvement of great convenience to the company, as it is the source from whence all the lower claims, such as the Yankee, Badger and Baker, are supplied. At Gold Run, the Hoskin claim has commenced washing, taking water from the ditch of the South Yuba canal company. The Cedar claim, belonging to the G. H. M. company, has nearly accomplished the work of cutting down the roof of the tunnel, and the long string of powder drifts is nearly completed. When these are finished, which will be in about ten days, they will be exploded, and the claim will then be ready for washing. The Indiana Hill claim, belonging to the Miners' Ditch, is also nearly ready for washing. What is said of the Cedar Creek above also applies to this claim, for they are in a similar situation. The superintendents of both have been busily engaged putting their claims in first-rate condition for taking out the precious metal with the least possible expense. The Gold Run and North Star claims are ready for washing.

PLUMAS.

GRAVEL.—Plumas *National*, Nov. 18: The North Fork company's men are now at work cleaning out their big ditch and putting waste gates in. Three weeks have already been consumed in that line, and it will take two weeks more to complete the work. The tunnel claims at Dutch Hill are looking finely and prospecting splendidly. Several carloads of gravel, lately washed up, paid from $60 to $100 to the car. Cumming's hill is about cleaned up for the season, and proved "way up." The company propose to drift this claim during the winter. The Sunnyside company are sending their tunnel rapidly ahead and are in first-class gravel. The air in the tunnel is very bad, and they are obliged to use the compressor, which formerly was in use at Dutch Hill, to furnish pure air to the miners. Providence Hill has been turned over to the Mongolians on a lease for one year. The terms of the lease include all the machinery, pipe, giants, etc., used by the Providence Hill company. The bedrock stripped during the last season was sold to Gee Shune & Co. for $2,000, this firm being the parties who leased the claim.

SIERRA.

PATENT.—*Mountain Messenger*, Nov. 18: The owners of the American Hill quariz mine are applying for a patent to their property. C. W. Hendel, U. S. deputy surveyor, has just finished surveying the same. Every mine must now have a United States title before capitalists will touch it.

SISKIYOU.

AGAIN PAYING.—Yreka *Union*, Nov. 18: We learn that Been & Co. have again struck the rich pay gravel in their claim in Klamath river, and are now taking out large quantities of dust daily. Kettlewood & Co.'s claim, though not paying so well, is more than paying its running expenses, and gives better prospects every day. We should not be surprised now if these claims were worked until very late in the season, in fact, until the derrick wheels were stopped by ice, as the river is not liable to raise much, we are informed, until near spring.

THE JOHNSON MINES.—From A. M. Johnson we learn that the quartz in the old Shepard & Trimble mine, which he has been opening, does not prospect as well as he expected it would. Mr. Johnson has put up extensive works at this ledge, consisting of hoisting apparatus and pumping machinery, and is determined to give it a thorough trial. He has sunk a shaft down 60 feet and then started a tunnel north and south from the bottom of the shaft. On one side the tunnel is already in some 25 feet and on the other side 15 feet. The ledge in the tunnel varies from two feet to 18 inches in width, and is all kinds of looking quartz, but does not prospect as its appearance would indicate it would. The quartz taken out on the top of the ledge pays about $24 per ton, but as depth is reached pays less. Mr. Johnson is of the opinion, however, that he has got off the pay shute, and that he will soon strike it again in one or other of his tunnels. He keeps about 17 hands at work continually. During the past month he has thoroughly repaired and overhauled his mill and expects to have it start up again on Monday, on quartz from his other mine, and will endeavor to keep it running.

TUOLUMNE.

THE CONFIDENCE.—Tuolumne *Independent*, Nov. 18: This mine has recently been considerably troubled with water in the 500-ft level, the pumps running night and day to keep it clear, and at last they had to give up working from the shaft. Work was then commenced to drive up a drift from the tunnel to tap the shaft. The tunnel being below the bottom of shaft, this was soon done, and the water drawn off. In doing this they were able to strike the old shute, which is very rich, free gold lying in the seams in big chunks, and will go $1,000 to the ton. This same shute has been struck in the 700 ft level, and undoubtedly runs to the surface. A new and rich shute has also been struck 1,000 feet from the shaft. Those who persist in saying that our quartz mines pinch out at 100 or 200 feet from the surface, are asked to explain how they reconcile their theory with the facts. In the only mines in the county where sinking has reached beyond that depth, the veins here proved larger and much richer. In the two deepest, the Confidence and Soulsby, no mines in this State make a better showing.

THE HYAPPO.—This mine, above Columbia, in the American Camp district, from which such large sums have been taken, still gives prospect of holding up its reputation. In the bottom of the shaft, which is 160 feet deep, the prospect is good. Owing to bad air and the great labor of hoisting on an incline by hand from such a depth, work in the shaft has been suspended, and a tunnel is being run from the rise on the vein, which, at the shaft, will be 400 feet below the surface. There is a shute about 80 feet from where the tunnel commences, which prospects, on the surface, $800 per ton, and which has probably been already reached in the tunnel. The rock is so very hard that only three feet could be driven in a week. The tunnel is below the water level, and the vein varies from 12 to 28 inches. At first, with two shifts, only 12 to 14 feet could be run in a week, the rock was so hard in the tunnel; but it is now getting softer.

OHIO.—*Union Democrat*, Nov. 18: The Ohio mining company has just completed a large frame structure, which entirely covers the machinery. The building is 53 feet long by 16 feet wide. The force employed in the mine has been engaged above ground lately, but as soon as things are straightened out above, they will commence sinking again.

PROSPECTS for paying $40 per ton, at least, in the Great Eastern mine, near the Ohio, are extremely good. They have a vein averaging three feet, and the rock on the dump will be milled at the Ohio mill.

THE New Albany mine, near Summersville, is, according to all accounts, doing well. They are sinking their main works, and have now attained a depth of 150 feet below their lowest level. It is said that the works will probably be sunk 100 feet deeper, giving 300 feet of a lift to stope out. The vein looks well, and a general air of prosperity surrounds the works of the mine.

AT the Soulsby mine workmen are engaged in putting in position a steam engine to take the place of the water power formerly in use, so as to give the ditch company an opportunity to clean their ditch and repair the flume.

Nevada.

ELY DISTRICT.

THE MINES.—Pioche *Record*, Nov. 12: From D. M. Tyrrell we learn that no change is taking place in the working of the Raymond & Ely and Meadow Valley mines. In both mines work is being carried on above the water level, with a fair amount of ore being extracted. The pinions and center-wheel have arrived for the Raymond & Ely, but nothing will be done with them until work on the pump of the Meadow Valley mine is started, as it has been demonstrated that the pump of the Raymond & Ely mine is insufficient to drain the water of both mines without the assistance of the pump to be erected on the Meadow Valley shaft. Very little else is doing in mining circles around Pioche except by chloriders. The furnaces at Bullionville and Highland are starting and we hope to give a good account of their runs before long. In the meantime we will have to possess ourselves with patience.

EUREKA DISTRICT.

NEW SHAFT.—Eureka *Sentinel*, Nov. 15: The Richmond mining company yesterday broke ground on Ruby hill for a new working shaft. The site of the new shaft is a point about 1,000 feet northwest of the present hoisting works of the company. It will be a three-compartment shaft, each compartment 4x4 and substantially timbered, and will be sunk a distance of 1,200 feet, at which point it is expected to tap the ore body now being worked by the company. Powerful hoisting and pumping machinery will be erected, and the shaft, when completed, will be the principal opening through which the Richmond mine will be worked.

A BUSY SCENE.—We visited yesterday afternoon the locality where work is in progress on the Richmond mine branch of the E. & P. R. R., and found everything life and activity. The place where the largest amount of work is being done is on the hill back of the K. K. furnace, at which point 70 men and 20 wagons and teams are employed. The men employed in the work are all white men, and receive white men's wages.

THE HAMBURG.—The appearance of the ore body in this mine continues to improve as further developments are made. The shaft in the bousnza is down 120 feet and the ore body has continued to enlarge from the surface to the bottom with indications of its continued improvement as greater depth is attained. There are already upwards of 100 tons of fine ore on the dump, besides a considerable quantity stowed away in the drifts. The company is working 20 men, a portion of whom are taking out ore, while the balance are running connecting and prospecting drifts. It is the intention of the company to build a couple of furnaces in the spring, and the prospects are that before that time a sufficient quantity of ore will be extracted to keep them running five or six months independent of the amount taken out after that time.

A REMARKABLE RUN.—The three large stone furnaces at the Richmond works have been running continuously for 200 days, and appearances indicate that they will last at least until Christmas before it will be necessary to close them down for repairs. The run they have already made exceeds we believe by about 50 days any ever heretofore made by any furnace in the district. They are lined with Pancake fire rock, and the extraordinary length of time which they have stood the intense heat to which they have been subjected is attributable, we presume, in a great measure to a careful selection of the rock and the workmanlike manner in which the linings were built.

GROOM DISTRICT.

SOLD OUT.—Pioche *Record*, Nov. 11: We learn from Henry Schaffer, just from Hiko, that Osborne and Baker have sold out their interests in Groom district to the English company, who were partially interested with them, and that the English company will soon start up work, Osborne and Baker to the meantime showing things along at Resting Springs district.

WARD DISTRICT.

ITEMS.—Ward *Miner*, Nov. 13: During this month the Martin White mining company have shipped 30 tons of bullion and have 15 tons on hand ready to ship.

NEW TELEGRAPH.—We are reliably informed that Mssj. Lovell will report favorably to headquarters as to the feasibility of a line to this city. The necessities for this line are obvious. There is not a town on the coast of like importance to the outside world, which cannot boast of telegraphic communication. Our city has a population of at least 800, and it seems to us that it will be a paying institution. It is proposed to tap the line at White river and bring it by way of Water canyon.

WASHOE DISTRICT.

CALIFORNIA.—Gold Hill *News*, Nov. 22: Daily yield, 450 tons of ore, keeping the mills all running up to full crushing capacities. The ore breasts on the 1500 and 1600-ft levels never looked better or yielded a finer quality of ore than at the present time. The returns from the mills indicate an increase over the bullion production of last month of about $200,000. The south drift on the 1000-ft level, running through the center of the ore vein to connect with the north winze sunk below that level, is steadily advancing two and a half feet per day, the face still in rich ore. The connecting drift between the C. & C. shaft and the ledge on the 1550-ft level has been cleaned out and repaired and the hoisting of ore commenced from that portion of the mine.

CON. VIRGINIA.—Daily yield, 400 tons of ore, that being all that the mills can crush. The ore breasts are showing splendidly, and the yield of bullion will be greater for November than it has been for the past two months. The north drift on the 1700-ft level has been cleaned out and repaired, and work again resumed in the face. This drift has penetrated nearly 400 feet into the Consolidated Virginia ground, and must before long make some very important developments in that portion of the mine. The drift is now perfectly dry, the water having apparently been drained by the C. & C. shaft. The ore breasts on the 1650-ft level have been opened and put in good condition for supplying ore through the C. & C. shaft by means of the connecting drift on the 1550-ft level. The 1400-ft station at the shaft has been retimbered and put in the best working condition. The entire mine is in the best possible condition.

JUNCTION.—The ore stopes on the 500, 700 and 800-ft levels show improvement at almost every point, some of the stopes yielding rich black sulphuret ore, second to nothing of the kind on the Comstock. Assays of average of this ore gave $12,000 and upwards per ton. Cross-cuts Nos. 1, 2 and 3, on the 800-ft level, all show a decided improvement during the week. The mine has never in the past shown as well as it does now. The ore production will be increased to over 300 tons per day by the first of December. Daily yield of ore, 260 tons.

SILVER CITY.—Work is actively resumed in this valuable old mine at the upper end of Silver City, after a rest of five or six months. Under the superintendency of Harry Brown, the old incline is being cleaned out, repaired and put in good working shape, it being the intention of the company to reopen the lower workings of the mine and go ahead with explorations at that point.

AUREOLA AND ARGENTINA.—The shaft having attained a depth of about 100 feet, with the bottom in very promising vein material, it has been deemed advisable to erect steam hoisting works forthwith. Superintendent Bennett has gone to San Francisco to make the necessary arrangements to that effect. Meanwhile, further sinking of the shaft is suspended.

IMPERIAL CON.—The south drift on the 2135-ft level from the bottom of the south winze connected with the north drift from the Yellow Jacket on Saturday. This was an object much to be desired, as it gives a greatly

Continued on Page 356.

Mining Prospects in the Black Hills.

A correspondent of the New York *World* writes as follows from Deadwood City, Dakota: Yon can now get from Cheyenue to this place, in comfortsble coaches and over fair roads, in four days' time; fare $35. As the distance is over 360 miles this may be cslled fast driving. The telegraph line is now this side of Custer City, and in about 60 days it will reach Deadwood. Theu, when a man makes a surprising "clean-up," he can annouuce the fact that he has "struck it rich," to his friends way down Eaet, almost before the event has happened, for our local time is two hours slower than New York time. For several miles before we get to Deadwood the road lies down hill all the way, till at last yon reaoh a jump-off place on the old road, which has been well graded and forms an easy inclined plane, at the bottom of which teamsters pay $1 toll, and then gallop down into "Deadwood diggings."

I was surprised to see a number of well cnltivated

Ranches in the Vicinity,

With good crops, although the graeshoppers had been here in great swarme a portion of the snmmer. Those who put in potatoes are getting five and six cents per pound, and "garden truck" brings a like good price. Between Deadwood and Bear Gulch there ie a beautifnl open country, well adapted to farming and stock-raising. From 20 to 30 miles this side of Custer City, in the beautiful valleys and parks, cabins have been huilt and homestead claims taken up. Whatever the reeults of mining may be in this new country, it seems certain that, if the Indians are removed, it will gather in a good many permanent settlers, attraoted by climate, fine stock ranges and good soil. Deadwood City, which was laid out only a few months ago, has now a population of about 5,000. It has a good city government, mayor, aldermen and police, the expense of maintaining which is met hy taxing all kinds of business, the rate being made especially heavy on saloons, bawdy-houees, aud faro and other gamhliug dene, which flourish here. Building ie still active, particularly in Sonth Deadwood, where 40 or 50 honses aud stores are going up. Although winter is near at haud, and large uumbers of claim owners have shut down and goue to the "States" until spring, yet the population does uot seem to "thin out" any, as there are fresh arrivale every day. Fully one-half of the able-bodied men seem to be idle and without visible means of snpport. How they will manage to weather it through until spring seems a mystery. There are very few "tender feet" among them. They are largely old miners, who have traveled California, Montana, Idaho, Utah and Colorado all over, and have been alternately rich and poor. So it is uo new thing for them to be "dead broke." It is a oondition whioh they borrow no trouble over, and which they expeot to work out of in due time.

There are some 10 "cities" and 30 different

Miners' Camps in the Black Hills.

The principal citiee are Deadwood and Custer. The latter last year was the supply point, and contained 3,000 inhabitants. It has now dwindled down to 400. There are Hill City, Lead City, Montana, Gay City, Elizabethtown and other campe. The total popnlation now in the "hills" is thonght by the best informed to be about 10,000. How much gold has been taken out by thie swarm of prospectors it ie hard to tell. Some think it will exceed eome $750,000. But even this would he poor wages for the three months' work of 10,000 men, supposing all had given their time to miuing. While some have doubtless made their fortunee, the great mass have not "made grub," as the expreesion is. The merchants and epecnlators in the varions towns have a lively trade and big profits; so, of conrse, they are doing well, and are more than satisfied with the prospects. The freighting teams and stage lines are also making a good thing. Gold-dust circulatee freely here, and greenbacks are at a discount. Pretty much all the etores, saloons, hotels and offices have ecales, and make their harter in "dnet," reckoning it at $20 per onnce.

The average claim owner at Deadwood is enthusiastic, but is always willing to sell out. Figuree are invariably high. There are plenty of miners with hardly enongh "dnst" to pay for a "square meal," who etick out for a round $100,000 before they will part with their claim. The whirl of specnlation seems to have seized the people. The honanza daye have ocme to Deadwood. It is currently reported in camp that the Wheeler brothers, who left here three or four weeks ago, with a guard of 20 men, carried out with them over $200,000 in gold dnst, the result of a season's work. A four days' olean-up of two men is just now the talk of the camp. It realized $5,500. The Hidden Treasnre has just been eold for $25,000, Clara No. 1 for $50,000 and the Wooleey for $60,000. The Alpha, a quartz mine, brought $50,000. It is said that the Wheeler brothers, who worked claim "No. 2," thought, when they left for the States, that they had got about all there was out of the mine, and so sold it for the pittance of $3,000. The first 24 hours' work by their succeesore cleaned np $3,240. The present owner made the $3,000, which he paid for the mine, selliug peanuts in a Montana towu. Now he is one of the prospective millionaires of Deadwood.

There are some 30 claims on Deadwood aud Whitewood that are doing well. No. 3, on Deadwood, is prodncing from $500 to $600 per day; No. 4, from $800 to $1,000. Some are just making a fair day's wages. Hired help get from $4 to $5 per day.

Gulch Mines.

The mines thns far worked are almost all gulch mines, and a shovel and Chinese pnmp are all the machinery necessary in working them. But valuable quartz mines have been discovered, and the future gold yield may he to a large exteut from this source. The gnlches do not follow any of the known rnles of supply, as in Montana, Idaho and Colorado. The rnns are narrow, and often for a few feet will pan out enormonsly, while in all the balance of the way scarcely any "color" will be fonnd. A few of the deeper claims, where drifting can be done, will be worked thie winter, bnt the larger nnmber being surface claime will he frozen np.

On Bare Butte creek the

First Silver Discoveries

Have been made, and a new town called Galena laid ont. Twelve tone from one of the lodes has been sent to Denver for reduction. It is claimed to be very rich. There are over 20 well developed ledges at Galeua. There seems to he a belt of "lodes" three or four miles ahove Deadwood City in which the quartz is quite rioh. From $15 to $20 a pan has been taken ont in some places. But the lodes are not what experieuced miners wonld call "well defined." They seem to be mere blow-outs or decomposed rock, and since there are no regularly defined veins the miners have doubts about their holding out. Without donbt all the free gold in Deadwood gulch comes from thie quarter. Negro Gulch district, 40 miles from Deadwood, is very promising, bnt there is lack of water. Parties in from the Big Horn country bring discouraging news. They report no gold, and great hardehips in their prospecting tour. This ie against the general expectation, as the Big Horn has been regarded as fahulously rich, bnt very few have ventured in there owing to the Indian troubles.

Deadwood

Supports a theater. The Langrishe tronpe hold forth nightly, their plays containing a certain amount of border life phraseology and experience, just enongh to "take" among the miners and bring down the honse. "Jack," the proprietor, is familiarly known in all the larger camps of the Rocky mountain region. Years ago he held forth at Tarryall and Buckskin Joe, np under the shadow of Mount Lincoln, in camps that then swarmed with gold seekers, but which long ago came to naught, and haven't even a cabin left to mark their site. The old Montana theater at Central City, the Wigwam at Denver, and the Virginia City, Cheyenne and other theaters have witnessed the runs seaeon after season of the Langrishe troupe. Last night was benefit night, the net receipts, $75, going to the hoepital fund. There are two or three variety entertainments here aud plenty of gamblers' dens. It is said by those who eeem to know eometbing ahout it, that the miners in and about Deadwood part with about $2,000 a week for their amusements, and $4,000 at a gaming table. If there are any poor men tempted to come out here and winter, eo as to get a good chance for early spring prospecting, they had hetter count the cost. Poor "grnh" at a cabin of a hotel, with a bunk on the hard ground, costs from $10 to $15 a week. Sugar ie three ponnds for $1; bacon, 35 cents; hutter, 60 cents; grain and corn, 10 cents a pound aud hay, $100 per ton. Prices are likely to be lower in the spring, as the various outfitting points are entering into a lively competition for this trade. Cheyenne hae had the lion's share, hut Fort Pierre, on the Missouri river, is now cntting in, the freighters from the latter point having reduced the price of hauling supplies to three oents per pound, while from Cheyenne it is seven. Cheyenue people are said to he making a move to lay out a shorter route to this place, cloiming that air line is not over 285 miles, and they propose to haul in supplies and passengers oheaper than any other outfitting point. If there is a big rush to the hills next season, as seeme to be expected, there will be a good deal of etrife between the several places that are aiming to profit from the Black hille furore. Cheyenne, Fort Pierre, Sidney and Sioux City will probahly come in for the biggest deal.

An Extensive Gravel Mining Claim.

During the last year or two several notices have been published in the *National* in regard to the work and prospects of the claims located at the lower end of the Spanieh Ranch basin, and called the Golden Enterprise. Last Monday, in company with a friend, we paid a visit to the mine, and found the owner, Mr. Richard Jacks, who politely escorted us over the claim, and pointed out the iteme worthy of note. Mr. Jacks has long heen of the opinion that the Spanieh Ranch basin was rich in the precious metal, aud that by blasting a cut through the canyon below, low enough to drain the baein, a fine paying property would be developed. Aoting on this idea, he commenced operatione in 1866, and opened the cut a euort distance and pnt in a flume, whioh was taken out by the high water. Again he tried it, and the second flume was carried away. The claim was worked no farther for several years, bnt the owner was far from giving it up. Last year he again commenced operations in "dead earnest." The cut was extended and a uew flume pnt in and at a heavy cost. The finme is the most substantial structure we have ever seen. It is 10 feet wide "in the clear," with a center-piece in the middle. When water is plenty the whole flume runs full, and when the creek is low in the fall, the water is turned into one side or the other. The bed-piecee of the flume are strongly hrsced into the rock side of the cnt, and weighted down so solid thst it would seem impossible for the water to do the least damage. The finme has a grade of one and a half inches to 12 feet, hut to eee the water and boulders rushing throngh it, one would think it twice as steep as it is. The present year the cut has been extended through the rim rock by Chinese contract labor, and considerable new flume hae been added at the head of that constructed the last season. The flume ie now 696 feet in length, and eome hnndreds of feet of the cnt at the head acts as a "ground-eluice." From the rim np the creek, no very large opening has yet been made, bnt wherever the creek has cnt down aud laid it bare, a fine hody of hlue gravel is exposed, which prospects on top, at the rate of—to use a miner's phrase—from five to 20 colore to the pan, and as far down as shafts have been snuk, the gravel increases in riohness. Mr. Jacke thinks his flume low enough to "bottom" the basin, and if he is correct, we see no reason why he hae not one of the heat claims in the county, and even if he should fail in places to reach the bottom, an immense quantity of gravel will certainly be worked. On the rim rock—the only place where hedrock was exposed—the gold is much coarser than in the top gravel, and pieces weighing $6 have heen fonnd. The facilities for working the claim are firet-rate. A spleudid head of water—ample for hydranlic washing of auy extent—covers the mine with a presenre of 150 feet, and besides this the whole of Spanish creek necessarily runs through the flnme. The recent little flood proved the strength of the present snmmer's work, as the water rau eight feet deep ahove the top of the flume, and not a block or timber moved out of place, and notwithstanding that thousande of tons of ragged pieces of rock weut through which had been blasted from the cut, the dump is clear, proving that there will he no tronble from that source. We look npon the Golden Enterprise as a snccese, and the owner certainly deserves credit for the perseverance and euergy which he has displayed in battling against the obstaclee in the way of developing the riches of the basin. The coming water season will give him opportunity of further opeuing aud developing the mine, and if it does not prove one of the beet payiug claims in Plomas county, we shall be badly disappointed in our calculations.—*Plumas National.*

Montana Mining Interests.

The Butte, Montana, *Miner* says: The amount of money, hard, eolid gold and silver, that has been taken ont of the minee of this Territory, compared with that which exists to-day in them, is like a rush light compared with a calcium. This may eeem at sight to he a rather rash statement, in view of the fact that onr minee have given to the world upwards of $150,000,000 of money siuce 1864. But it is a statement which we repeat and repeat meaningly. When one takes into consideration the great ore belts of Montana, interlaced all throngh the country, that in these ore-belts there are hundreds upon hundreds of ledges, only a few of which we know anything ahout, that of thoee that are known an immenee quantity are what are called rebellious oree, known to contain large quantities of gold and silver, and which will some day prove of enormons value, for the problem of redncing them will to a dead certainty he solved in the near futnre, that all the developments npon a majority of the known ledgeé amount to but little more than what miners graphically call "coyote holes." When one takes into conoideration all these facts, the fntnre of the Territory eeeme of such Monte Chrieto-like character that the mind will hardly grasp it, and yet all of this is trne, in our opinion. The Comstock lode hae produced over $300,000,000 eince its discovery and the ores from those mines are estimated to yield on an average not over $50 per ton. How much wonld he produced were all of the mines of Montana worked, in proportion to to their value, in thie way, and with the completenese that the Cometock lode has been? One cannot face the figures which are called into existence as the logical result of thie train of thought. But what has heen, and is the diffienlty to-day? What ie the reaeon that our mines have not been developed? Simply because we have uc money to do it with. We have property worth, there can be no doubt of it, millions and hnndreds of millions of dollars, and we have to wing it with, say one-fourth of the assessed valuation on our working capital. What we need is more money. In Sau Francisco, New York and the other principal cities there is all the money we want lying comparatively idle, for certainly three, four and five per ceut, is not much to get for the use of it. Aud still they are eatisfied, and why? Simply because they have no market for it, have no way in which they can get more for its use. The sitnation may be pnt in this way: Those people have the capital, we have profitable properties wanting capital in order to be made to give np their wealth, and the problem is how shall their money and our minee be brought together.

This ie the problem to he solved—difficult in its solution, but yet there is a solntion, and it can be found. Although the labor of finding ont the answer ie great, certainly never could lahor be paid for in a more princely way than what that would be. Every plan which looks in auy way toward accomplishiug this purpose should be carefully inquired into, and if it looks as thongh it wonld be successful, should be enconraged to the utmost. Here is one thing would help to do this amazingly: Let our legislatnre at its sitting this coming winter authorize some one, thoroughly competent to do the work, moke an examination of our mines, give the geological formstions of the different districts, the number of leads, as near as possihle, in each district, the average value per ton of ores contained in those dietricts, as near as may be, whether gold, silver or copper; and the person employed to do this make a report and submit it to competent and experienced judgee for acceptance, and if it he a concise and reliable condensation of the facts set forth, have it published in pamphlet form and distributed throughout the States. By thie means, at a trifling expense, would many people come to know that there are miues of valne in Montana, hecanse a work of this kind would naturally attract more profonnd notice than any other meane that could be resorted to, having the sanction, as it would, of the local government. See that something of this nature is accomplished thie winter, you men that sit in legislative halle and use the people's money.

The Wheeler Expedition.

The Virginia *Enterprise* says: Lieutenant Symons, of the Wheeler expedition, and in command of that part of it whioh hae been operating hereabouts, together with W. H. Rideing, correspondent of the New York *Times*, who has also been taking notes of the doinge of the expedition, visited the sanotum yesterday afternoon. From them we learn fnrther particulars of the movements of the various sections of the expedition.

Lientenant Macomb's party are still eugaged in the triangulatiou of the couutry aronnd Lake Tahoe. They have occnpied Freel's peak (sometimes called Job's peak), Pyramid peak, the Twin peake nnd other etations and made their observations. These are all connected hy a net-work of triangulation with the base line of the party, nud from the data thns gained exact distances and localities are determined.

Lieutenaut Tillman and party have completed their work north and west of Reno, and are now assieting Lieutenant Macomb. Lientenant Tillman and hie party have occupied Caetle peak, north of Trnckee. The asceut of this peak ie not known ever before to have been accomplished. Only two meu made the ascent, as it was. They found the snow very deep, often reaching the hellies of the mnles, and averspiug from three to four feet. The firet man who made the ascent assisted hie companion up with a rope, and thus the obeervations were made. The top of the peak is very small, only affording standiug room for those who gained the summit.

The doinge of Lieutenant Symons aud party have been mentioned from time to time and need not be repeated. Mr. Carl is doing eome admirable work in making the topographical survey of this section. It will take a part of next enmmer to complete the work, and the map thue made will be the finest and most complete ever made on the Pacifio coast.

The party to the east are in the desert country, and have not been heard from of late.

All parties are to rendezvous in Carson early in December, where they will dishand for the season and take up the office work in Washington.

New Gravel Mining Company.

Among the numerous persons passing through thia city, we noticed thie week Mr. Smyth, formerly superintendent of the Electric mining company, who, as we have learned, has lately purchased the eo-called water right on Fall river for a San Francisco company, with the intention of working the large gravel depoeits near that river. Mr. Smyth was accompanied by several gentlemen, among them Mr. R. H. Moore, who will take charge of this company's worke as superintendent, and put immediately o large force of men at work to repair ditches and flumee and prepare, with all poseible speed, the whole in working order before the winter sets in. Several teams loaded with the uecessary snppliee for a whole season, have left here, together with a complete outfit of mining tools. The property of the Fall River mining company is situated in the northeastern part of thie connty near the Plnmas county line, betweeu the middle and south forks of the Feather river, and contains over 500 acres of gravel with a large quantity of water, splendid facilitiee for working it and a dump of several hundred feet. A good wagon road leads to within a few miles of the claims, aud will be extended to the mine as soon as practicable. An old channel, it is said, exists in the gronnd claimed by thie company, which is generally coneidered the northern extension of the Moorsville diggings. We are glad to see this new enterprise going into operation, especially as it is in a section which has been comparatively but little prospected, and wherever ravine or river mining haa beeu done, it has and is still paying well. There are others south of the Fall River company's claims whioh are getting ready for extensive work, bnt we have not been able to learn more particulars, bnt hope that we will hear soon of their complete success, by helping to swell the already large shipments of dust to thie place. There ie pleuty of room for more suoh enterprises in Butte. Who will come next?—*Oroville Mercury.*

The Bullion Tax in Nevada.

Suits have been commenced in the District Court in and for the first judicial district of Storey county, Nevada, for the recovery of the bullion tax upon the proceeds of the Consolidated Virginia and California mines for the second quarter of the current year, running from April to and including June last. These suits are brought in the name of the State of Nevada as plaintiff by R. H. Lindsay, Esq., District Attorney of Storey county.

The complaint against the California mining company alleges, among other things, that during the time above mentioned 29,120 tons of ore became, under the law, assessable, and were assessed by Thomas Gracey, assessor of Storey county, at the rate of $155 per ton, and that the company thereupon became liable to pay taxes as follows: State tax, $33,624 01; county tax, $14,944.01: railroad bond tax, $18 680.01; school tax, $5,604; making a total of $72,852.03. To this amount are added, as penalties for non-payment of the tax: First, 10 per cent., amounting to 7,285.20, and then 25 per cent., amounting to the further sum of $18,-350 23, making a total of $98,350.23, for which amount judgment is demanded.

The complaint against the Consolidated Virginia mining company alleges that, as above, 36,093 tons of ore became assessable, and were assessed at the rate of $100 per ton, and that the company thereupon became liable to pay taxes thereon as follows: State tax, $23,014.80; county tax, $10.228 80; railroad bond tax $12,-786; school tax, $3,835.80; making a total of $49,865.40. Penalties added as above, $4,986.-50 and $12,466.25; making a total of $67,318-.15, for which amount judgment is demanded.

Mining Present River Beds.

A correspondent of the *Foothill Tidings* (Nevada county) says: Since witnessing the failure of the enterprise known as the Deer Creek gravel gin, allow me to vent an idea for working such places as that in Deer creek. I present it as a suggestion, for what it is worth.

There is, no doubt, a large amount of gold lying in Deer creek at and near this point. The original bed could hardly have been half worked out, when the tailings from the mines about Nevada City began to obstruct the work. Now, my plan would be to build a substantial and durable dam at some point where there would be fall enough to keep the tailings clear. The top of the dam should be on a grade with the top of the gravel above; the object not being to back the water but to support the gravel. Now I would start a tunnel right through my dam, at the lowest point of the bedrock, cut it down as low as I could, timber it up with good, durable timber and lag it tight. Then I would lay my sluices in the tunnel—of course the sluices would have to be low grade and I would have to use a big head of water. I would commence my pit above the dam, from shore to shore, flinning the waste water over the pit and dumping it below the dam; covering the tunnel as I went with the boulders and waste dirt. In the fall I would timber my tunnel up to the face across my pit, board up the end, cover it over good with boulders and gravel and dirt, take out my waste water flume, let my pit fill up and slick over until spring. Then I would put in my waste water flume again, sluice out my tunnel, open another pit and so on to the end of the chapter.

CONCERNING PUTTY.—Glaziers' putty is made by working ordinary whiting into a paste with drying oil. Common putty becomes exceedingly hard with age, a circumstance which renders the removal of glass from sashes peculiarly difficult. Old putty may be softened by using a paste of caustic potash, easily prepared by mixing carbonate of potash or soda with equal parts of freshly burnt quicklime, which has previously been sprinkled with water, so as to cause it to fall into powder. This should be mixed with water to a paste, and spread on the putty to be softened. Where one application is not sufficient, it is repeated. In order to prevent the paste from drying too quickly, it is well to mix it with less water, adding some soft soap instead. By the application of a hot iron the putty becomes so soft that the glass can be removed by the fingers and the putty easily scraped away. All that is required is a block of iron about two and one-half inches long by one and one-half inches square, flat at the bottom, and drawn out for a handle, with a wooden end like a soldering-iron. When hot (not red hot) place this iron against the putty or flat on the glass, and pass it slowly round the sides of the square. The heat will so soften the putty that it will come away from the wood without difficulty. Some of it may be so hard as to require a second application of the hot iron, but one experiment will give sufficient instruction to meet all difficulties.—*Journal of Chemistry.*

THE CHANNEL TUNNEL.—The work of sounding for the projected channel tunnel is advancing rapidly. On the 1st of September the depth of the shaft at Sangatte reached 107 meters; on the 1st of October it had increased to 119, and on the 9th inst., to 122 meters. The boring of this shaft, which is to be sunk to a depth of 130 metera, will probably be completed towards the end of the present month. The soundings of the strait were taken some time back. The result of these operations appeared entirely to confirm the expectations of the geologers.

USEFUL INFORMATION.

The Porosity of Brick Walls.

Professor Pettenkofer has made a curious discovery, that brick walls are readily permeable by gases. A writer in the *American Architect* gives the following description of the experiment, translated from the "Records of the Royal Academy in Munich:"

Pettenkofer caused to be erected, upon a cast iron plate, a section of wall two feet high, two and-a-half feet long, and twelve inches thick (the bricks he used were twelve inches long). It was put up with bricks carefully laid in lime-mortar. After the brick-work was thoroughly seasoned, the two faces of the walls, containing five square feet each, were plastered with a floated brown finishing coat. This being well dried, the edges were pargetted with plaster of paris. Time was again given for evaporation, when the plaster of paris was overlaid with a coating of wax, oil and resin. Next metal plates, with flanges turned over the edges, were cemented to both faces of the wall, firmly clamped and screwed tight. In this manner the rims and margins of the metal plates were fitted and secured to the wall, the whole being air-tight, while there remained thin layers of air inside the margins, between the faces of the wall and the metal plates. Both metal plates had holes in their centers, one-third of an inch in diameter, and to these short tubes were soldered. If air was impelled through the tube attached to one metal plate, it had to penetrate the wall before it could be discharged through the tube of the opposite metal plate. The net area of each metal plate, facing the air-cushion between it and the wall, was three and-a-half square feet. A lighted candle was placed directly in front of the open tube on one side, and, by blowing in the open tube on the opposite side, the air would pass through the wall and extinguish the light without any trouble whatever. The current of air had, of course, much more velocity in the tubes than in the wall, since the exposed area of the wall was 2,860 times larger than the area of the tubes. Assuming that a light wind of 10 feet velocity per second had acted on the open tube, this velocity, though much diminished within the porous wall, would regain its original speed when passing through the other tube, and no doubt suffice to extinguish the light. Supposing the solid particles of bricks and mortar occupied three-fourths, and the pores one-fourth part of the exposed surface, the air would have moved 2860-4ths or 715 times slower in the wall than in the tube, and a velocity of 10 feet would have been reduced to about 14-100 of a foot. Now, our nerves being insensible to a motion in the air of one foot and over, it is clear that a motion of 70 times less speed will go on without our being aware of it.

Charcoal Instead of Lime.

A very important discovery has been made that charcoal, animal or vegetable, is a better agent than lime for the removal of the hair from hides, preparatory to tanning. An exchange assures us that the depilation of hides with charcoal appears likely to supersede altogether the usual lime process. As is well known, charcoal has the property to take up large quantities of oxygen from the atmospheric air, and the oxygen in this form seems to exert a chemical influence on the fatty substance present in the neighborhood of the glands of the hair roots. An oxidation takes place in the pores of the skin, which destroys the glands and loosens the hair. Finely powdered charcoal is mixed with sufficient water to make a thin paste, and the hides immersed for four or five days and well turned. Hides treated with charcoal require no other operation, as in the case of the lime process, and after being washed with water, they are ready for tanning. Animal or vegetable charcoal can be used in any quantity, having no deleterious property whatsoever. For each hide, six or ten pounds with the necessary quantity of water are sufficient, and the temperature to be maintained is 61 or 70 degrees Fahr. This information may be of great value to the people in the interior of the State, who occupy themselves in the tanning of that common leather, known in America as *suela*. There is always a great demand for this leather in the manufacture of saddles and accoutrements for the cattle-men and travelers, also for trunks, shoes, chair bottoms, and other articles of utility. The demand is so great that the suelas have, most of them, to be brought from Guayaquil, Payta, and other foreign places, where it seems they can be prepared more cheaply than by our native workmen. By the use of charcoal, which is much cheaper and more readily obtained than lime, the tanners will be placed on a more advantageous footing for producing the suelas at a considerably less cost than hitherto. They will then be able to sell the article at a cheaper price and yet secure quite as much profit as before. It is a matter for surprise, that so remunerative a trade as the tanning of hides into leather has not yet become a leading industry in this State. Hides can be had in great abundance for this purpose, and the bark for the conversion of hides into leather, can be obtained all along the sea-shore, and of the best quality. The mangrove or mangle plant, the bark of which is thus used, is present everywhere on the coast.—*Panama Star.*

Copper in Cast Iron.

It is well known that wrought iron containing some tenths of per cent. of copper is red-short; meanwhile in some of the best irons from Siberia was found from 0.01 to 0.03 per cent. of copper. In some specimens of steel I found 0.2 per cent. of copper; this steel was not brittle, and had been used with success for manufacturing steel axles. The presence of copper was found in several specimens of cast iron coming from blast-furnaces of the South Oural mountains. These specimens, when examined and analyzed, showed that the presence of copper in cast iron may amount to a higher percentage than in steel or iron without altering the quality of the metal. Unfortunately it is not so with wrought iron or steel. The specimen examined was much used for castings; it filled up the molds beautifully, and had a very handsome appearance; fresh cut it had a dark gray color. Under the microscope small grains of copper were easily remarked in the mass of the metal. This peculiar sample of cast iron was carefully analyzed, and the analysis gave the following average composition: Iron, 83.514 per cent.; copper, 8.123; tin, 1.252; cobalt, 0.501; silicium, 0.952; tungsten, 0.125; carbon, 3.001; manganese, 2.312. Total, 99.780.

While analyzing some iron samples for copper, I often used, in case only traces of copper could be detected, the following method: The specimen is dissolved in hydrochloric acid, and the copper and iron are precipitated by an excess of ammonia; the mixture is boiled and filtered; the blue liquor is evaporated nearly to dryness, and the resulting residue is dissolved in sulphuric acid. Into this solution a piece of magnesium ribbon is placed, which, in case of traces of copper, is quickly covered with a layer of this metal; that is easily observed under the microscope.—*Chemical News.*

PETROLEUM AS FUEL IN RUSSIA.—The demand for English coal in St. Petersburg and in the north of Russia is likely to be considerably reduced, partly in consequence of the large quantity now imported from Westphalia, and partly from the impetus likely to be given to the production of mineral oil. An American speculator, who has "struck oil" in the valley of the Volga, has taken on lease 350,000 acres of land, which he has already begun to work. He promises to sell petroleum at 30 per cent. under the price of that imported from America, and he has already shown the value of his discovery by supplying some of the steamers on the Volga. It is said that the companies which have tried heating with the new fuel are perfectly satisfied with the result of the experiment.

GOOD HEALTH.

The Value of Condiments.

By condiments we mean substances like sugar, spices, vinegar and others that are employed to impart flavor and piquancy to the staple foods. They are usually regarded as non-essential, and some writers on dietetics have gone so far as to condemn their use, unless in rare instances and in the most infinitesimal proportions. Like all good things they are liable to be abused, but when properly used they are valuable elements in our daily food. Prof. Voit, of Munich, than whom there is no higher authority on such a subject, considers that their importance has not been sufficiently recognized. It is not enough that food should contain alimentary principles in proper quantity; to render it really nutritious there must also be a supply of condiments. These have been compared to oil in a machine, which neither makes good the waste of material nor supplies motive power, yet causes it to work better; they render essential service in the processes of nutrition, though they are not of themselves able to prevent the waste of any part of the body. "A dietary deprived of condiments, a mere mixture of alimentary principles without taste or smell, is unendurable, and causes nausea and vomiting." It is not until condiments are added to aliment that it really becomes food. Extreme hunger may enable us to dispense with them, as it may compel us to devour what at other times would be disgusting, but under ordinary circumstances they are an essential part of our diet.

Condiments have an important influence upon the processes of digestion and nutrition. The mere sight or thought of a savory dish "makes the mouth water"—that is, it makes the salivary glands pour out their secretion copiously, which is an important stage in digestion, especially for certain articles of food. Experiments made upon dogs show that a similar effect is produced upon the gastric secretion, and thus the work of digestion is further promoted. The loss of the sense of taste would be not merely a loss of enjoyment, but a positive injury to the digestive system. The very smell of food may do us good, just as certain odors will restore a person who has fainted.

It does not follow because condiments are useful, that we may not have too much of them; on the contrary, their best effect depends upon their being used in moderation. The more decided the flavor of any article of food, the sooner does it pall upon the appetite. It is one of the peculiar merits of French cookery that flavors are so delicately blended; no one is specially prominent, and yet by their different combinations a wonderful variety of appetizing effects is produced. We Yankees, like the English, are apt to use condiments in a coarse, reckless way, and thus miss their finer and more exquisite effects, besides losing much of the benefit that might be derived from them. By a nicer care in their employment, the plainest and simplest diet might be made at once more delicious and more digestible.—*Journal of Chemistry.*

Burns and Scalds.

The following from Mr. Holmes' recent "Manual of Surgery" has the merit of giving much useful information in a concise form: At the time of the accident, the main indications are to exclude the air from the burned surface, to allay pain by opiates, and to give stimulants in such quantities as may be necessary. The applications which are in use for burns are too numerous to mention, and the choice of one or other of them will depend in a great measure on the depth of the burn. A mere superficial scorch is best treated by some warm solution applied on a thick rag and kept constantly moist. Common water with laudanum is perhaps as grateful as anything. Painting the surface with ink soon relieves the pain of a small superficial burn, or covering it with whitewash or some other similar substance, which will crust over it and completely exclude the air from it. Common flour thickly dredged on the part is a very good and handy application. But such crusts should not be applied over burned surfaces of the second degree, since their removal would soon become necessary, and this would drag off the epidermis. The bullæ should be pricked, the epidermis gently smoothed down, and some simple ointment put next the skin, or some oily substance which will not stick when it is necessary to change it. A very favorite application to these burns and to others of greater depth is the Carron oil, made by mixing lime water and linseed oil in equal parts, and deriving its name from its having come into extensive use at the great Carron foundry in the numerous burns occurring there. Oil of turpentine is a very good application to burns in which the surface of the skin is quite destroyed. But for the first few days I doubt whether anything is better than simply swathing the part in thick layers of cotton wool, which is prevented from sticking to the burned surface by some simple ointment (cerat. calaminæ is generally used), spread on thin soft linen or cambric, and covering the whole burned surface. When, after a few days, the discharge becomes foul, this dressing should be changed for some deodorizing or antiseptic, oily application, or the latter may be used from the first; but all the antiseptics I have yet seen used have been stimulating, and for the first few days it is desirable, I think, to avoid any local stimulation. The carbolized oil answers every indication better than any other substance I know of, but it should not be used too strong; for it may both prove too stimulating, and thus increase the discharge, and it may be absorbed, producing a black condition of the urine, and other symptoms of incipient poisoning. It is well, then, to begin with a very weak solution (about one to twelve), and if this does not correct the fetor its strength may be gradually increased, or a stronger solution of carbolic acid may be placed over the dressings.

Causes of Fever and Ague.

There has long existed a diversity of opinion in regard to the principal causes of intermittent fever. Many years ago it was generally supposed to be produced by the malaria of marshy districts, and a residence in their vicinity was considered hazardous. We will not say that the malaria from marshes has nothing to do with intermittent and other fevers; but we do not believe it is the chief cause of their development.

We are acquainted with many families that have lived for years on the very borders of marsh lands and have enjoyed perfect health all the time, while the residents of the high lands near them have suffered greatly from fevers.

We are somewhat skeptical as to the power of miasm arising from natural marshes to produce disease. Where the water of mill ponds is drawn out during the day, and a mass of vegetable matter is exposed to the heat of the sun, or where large masses of earth are thrown up from considerable depth below the surface, sickness is almost certain to prevail in the neighborhood, and often extends for miles around. Bating these causes of fever, which causes are entirely artificial, we do not believe that locality has much to do in producing them. Imprudence in dress, in diet, and in the habits of life generally, will sooner or later bring on disease; a little sooner, perhaps, in localities where the climate is not perfectly salubrious, since another element is added to those that already exist.

He who expects to enjoy immunity from illness by simply selecting a healthy place of residence without the exercise of prudence in living will be disappointed. There is no doubt that the principal cause of nearly every form of fever and of many other diseases is impure water. Second in order is the proximity to cesspools and decaying animal and vegetable matter. Third—exposure to chilly air of the evening and morning. Fourth—over exertion and insufficient sleep and rest. Fifth—want of attention to the condition of the bowels.—*Hall's Journal of Health.*

MINING AND SCIENTIFIC PRESS.

W. B. EWER.....SENIOR EDITOR.

DEWEY & CO., Publishers.

A. T. DEWEY, GEO. H. STRONG
W. B. EWER, JNO. L. BOONE

Office, No. 224 Sansome St., S. E. Corner of California St., San Francisco.

Four weeks are rated a month.

Large advertisements at favorable rates. Special or reading notices, legal advertisements, notices appearing in extraordinary type or in particular parts of the paper inserted at special rates.

SUBSCRIPTIONS payable in advance—For one year, $4; six months, $2.25; three months, $1.25. Remittances by Registered letters or P. O. orders at our risk

SAMPLE COPIES.—Occasionally we send copies of this paper to persons who we believe would be benefited by subscribing for it, or willing to assist us in extending its circulation. We call the attention of such to our prospectus and terms of subscription.

THE ORIGINAL ARTICLES in this paper are mostly set in solid type, giving in our columns one-third more reading than is contained in ordinary leaded matter.

ADDRESS all letters to the firm, and not to individual members, or others, who may at any time be absent from our office.

Our latest forms go to press on Thursday evening.

San Francisco:
Saturday Morning, Nov. 25, 1876.

TABLE OF CONTENTS.

GENERAL EDITORIALS.—Asbestos and its Industrial Uses, 345. Mining Information Needed: Remarks on Quicksilver; Comstock Papers, 352-3 Formal Closing of the Centennial; Improved Artesian Well Borer, 353. Items of Interest from the Mines: Singular Specimen; Thanksgiving, 356. Patents and Inventions, 357.

ILLUSTRATIONS.—Asbestos and Its Industrial Uses, 345-53. Woodhouse's Artesian Well Borer, 353.

CORRESPONDENCE.—More of the Quartz Mines of Madison County, Montana; Mines in Amador Co.; The Planet Vulcan, 346.

SCIENTIFIC PROGRESS.—A Geological Congress; Forests and Climate; Notes from the French Academy; Theory of Luminous Flames; The Phonetic Telegraph, 347.

MECHANICAL PROGRESS.—Improvement in Tube Making; Wooden Steam Boilers; French and American Mechanics; Rope Gearing; The Belgian Cable Towing System, 347.

MINING STOCK MARKET.—Sales at the San Francisco, Pacific and California Stock Boards; Notices of Assessments; Meetings and Dividends; Review of the Stock Market for the Week, 348.

MINING SUMMARY from various counties in California, Nevada, Colorado and Arizona, 349-56.

USEFUL INFORMATION.—The Porosity of Brick Walls; Charcoal Instead of Lime; Copper in Cast Iron; Petroleum as Fuel in Russia, 351.

GOOD HEALTH.—The Value of Condiments; Burns and Scalds; Causes of Fever and Ague, 351.

MISCELLANEOUS ARTICLES.—Mining Between Liberty and Lowell Hills; Paved with Silver, 346. Mining Prospects in the Black Hills; An Extensive Gravel Mining Claim; Montana Mining Interests; The Wheeler Expedition; New Gravel Mining Company, 350. The Bullion Tax in Nevada; Mining Present River Beds; Concerning Putty; The Channel Tunnel, 351. Pacific Coast Railroad Items, 352. Thanksgiving Proclamation by Governor Irwin, 353. Mining Appliances; British Lead Mines; On a New Water-Pressure Pumping Engine at Clausthal; India Rubber; Nickel, 354.

NEW ADVERTISEMENTS.

Asbestos Materials, Thompson & Upson, S. F.; Gulf of California Oyster Co., Office, S. F.; The Golden Sun Gold Mining Co.—Meeting.

A BLACK hills correspondent says: The country so far developed would he good enough for about 2,000 men, but I presume there are now between 7,000 and 8,000 in the hills, and at least as many coming in and going out, principally Western men. Wages are generally $4 per day in dust; drifters get $6 and $7, but very few are employed; dust in trade goes for $20 per ounce, which assays at the mint from $17.50 to $19.92. Work is very scarce, and there are a great number of broken men here. Flour is selling from $8 to $12 per hundred, bacon 30 cents, sugar 30 cents, coffee 40 cents, and potatoes at 12½ cents per pound. The latter are raised in the Black hills.

THE suspension of the Continental life insurance company affects some 70,000 policy-holders, as well as its other creditors. Although the managers are of the opinion that the policy holders will lose nothing, we doubt very much whether the people who have been paying their annual premiums for eight or ten years will be much comforted by this assurance.

THE suit of Mrs. Kate Sullivan against the Savage mining company, in which plaintiff claimed $150,000 damages for the death of her husband, through the alleged incompetence of defendant's employees, was tried in the United States Circuit Court in Carson, Tuesday. The case was given to the jury at two P. M. In the course of the evening the jury reported that they were unable to agree and were discharged.

RETURNED.—Our senior editor, Mr. Ewer, returned from the East on Monday of this week. He comes to us again in good health and spirits, and we trust will he much benefited by the long vacation which he has enjoyed.

Mining Information Needed.

In the various reports of mining commissioners to the Governments have been described the numerous pans and batteries used for crushing, grinding, amalgamating, etc., but in them can be found no data from which miners can form any opinion as to the comparative merits of the various machines in use. No better thing could be done or a greater service rendered to the miners than for the proper officials to collect in his next report some data by which they could form an intelligent idea as to what, out of the great multitude of machinery offered to the public, would be the best, most economical and most effective, under all or any particular circumstances. As it is, the miner has nothing but the reports of interested parties, or his own usually limited experience to guide him in his choice. This condition of things, as might reasonably be expected, often results in great pecuniary loss.

We have an almost infinite variety of batteries, pans, amalgamators, concentrating machines, riffles, plates, aprons, screens, ore feeders, etc., from which to choose. A person about to build a mill, after looking around a little, guesses at some plan he has seen, and then proceeds to construct his mill. If he does not change his mind three or four times, at the suggestion of friends, before he has his mill completed, it is because he is possessed of more firmness and decision than falls to the lot of a large portion of our most intelligent miners and mill-men.

Such results are inevitable from our loose and uncertain manner of working. If private individuals can not be induced to undertake it, Government, or the States of Nevada and California, might do well to establish an experimental mill, where every new machine as it comes out might be tried at the inventor's expense (necessary power, etc., being furnished) and under the direction of intelligent and competent men, before the public should think of placing the least confidence in the invention. Among the many things which the miners wish to know and which few companies attempt to ascertain at their individual cost, is the relative efficiency of stamps of given weight; hight and frequency of drop; general mode and arrangement of a battery; whether one pan is better than another, and which; whether the yield obtained is better in one than another; whether one loses more or less quicksilver than another; relative power to drive the machines in proportion to the work done; proportional wear and tear of iron per ton of rock crushed; amount of concentration effected by one concentrator over another; relative cost of running and amount of sulphurets saved; amount of water or power required for mills of certain size with certain kinds of rock; classes of engines best adapted for certain kinds of rock, etc.

One is surprised that, after so much experience as the miners of this coast have had, there is so little reliable information to be had on the subjects referred to. The miners are entirely dependent on the newspapers for what information they do get. The newspapers have also great difficulty in obtaining this class of information, as those who possess it are rarely willing to publish any of their experience. We hope that some day an experimental mill will be maintained at the State University, or elsewhere on this coast, where such data as we have mentioned will be collected and be open to the investigation of all parties interested.

Pacific Coast Railroad Items.

Early Tuesday morning the westward bound freight train broke in the center, near Gold Run, and the two sections collided, smashing several cars and knocking one or two from the track. The delay occasioned by the occurrence rendered the Virginia City lightning express four and a half hours late.

Says the Vallejo *Chronicle* of Tuesday: The railroad company have commenced work on the bridge across Napa river, and have begun work at Union station, which is the further end of the new air line track. They expect to have the whole line finished and ready for operation by the 1st of December. Some difference will be made in running time by this cut off, the saving amounting, probably, to ten minutes.

The Dumbarton & Santa Cruz narrow-gauge railroad company will build their depot at Santa Clara on the corner of Sherman and Franklin streets. The surveyors for the continuation of this railroad from Los Gatos to Santa Cruz are at work in Scott's valley, and will be in Santa Cruz within 30 days. As surveyed there will be three tunnels, one of 600 feet, another of 1,650, and a third, 1,680. The estimated cost of the road is less than $20,000 per mile.

The Felton & San Lorenzo railroad company have filed articles of incorporation in the office of the County Clerk of Santa Cruz county. The company propose to construct and operate a narrow-gauge road from the town of Felton up and along the San Lorenzo river, a distance of 15 miles, and also along Bear creek, 7 miles, and Boulder creek, 10 miles—the entire road to be 32 miles. The corporation is to last 50 years, and the principal place of business to be at Santa Cruz. The capital stock is $500,000, divided into shares of $100 each. The Trustees are C. G. Harrison, John S. Carter and W. T. Tisdale, of this city, C. H. Gorrill, of Santa Cruz, and James P. Pierce, of Santa Clara.

Remarks on Quicksilver.

[Written for the PRESS by SAMUEL PURNELL.—No. 5.]

In 1866, from the annual report of the New Almaden mine, it was seen that 13,442 tons of ore were treated, with an average yield of 11.62 per cent. Cost of mining, assorting and smelting was $16.15 per flask, to which $7.60 was added for interest, taxes, improvements, etc., making the actual cost $23.75, or 31 cents per pound. In 1874, however, the actual cost was claimed to be not over 26 cents per pound, and it probably does not vary much from this latter figure at present.

In 1874 the superintendent of the Valley mine, working poor ores, estimated his expenses as follows: Mining, $2; smelting, $1.55; total, $3.55 per ton. These are low prices, and it is seen that some of the elements of cost are omitted. The furnaces worked 20 tons of ore daily. Yield was very low, only 200 pounds per day. The losses were evidently very great. According to the superintendent's estimate, the quicksilver produced cost 30 cents per pound. The real cost was probably double as much.

At the Great Western mine, near Calistogs, a furnace was erected in 1873 to work 12 tons a day. The cost of smelting was estimated by Mr. Luckhardt at $1.25 to $1.50 per ton. He considered a fair profit could be realized on one per cent. ore. Quicksilver was then higher in price than it is now, averaging about 98 cents per pound. These works are not at present in operation.

At all the California mercury works both workmen and vegetation are much injured by the escaping vapors.

The Condensers

Now used at New Almaden are an invention of the manager, Mr. Randol, and consist of a glass house, composed of panes of glass set in sashes. He considered them more effective than the forms used previously.

The Haehner furnace uses the old style of cooled chamber condensers; so also does the Knox & Osborne furnace.

From a statement in Volume XXX of the SCIENTIFIC PRESS it appears that the

Profits of Quicksilver Mining

And smelting in California have been very large. Taking 50 cents per pound as the usual and average price of mercury, and the cost as 26 cents per pound, the net profits for the years 1871, 1872, 1873 and 1874 were over 400 per cent. as follows:

Production in 1871,	2,438,896 lbs.,	averaging 99 cts.	℔ lb
" 1872,	2,318 409 "	" 80 "	"
" 1873,	2,087,900 "	" 93 "	"
" 1874,	2,612,781 "	" $1,37½	"

That is, the net profits for these four years alone were $7,436,304; while the extra profits over the average price of 50 cents per pound for these years were $4 765,922. Up to the close of 1875 the total production had been some 64,000,000 pounds, on which, it has been estimated, the net profits were about twenty million dollars.

In Conclusion

The author would suggest that those interested in quicksilver look closely into the facts and principles hereinbefore stated. The reasons for anticipating a material advance in the price of mercury are not obvious; while those for a still further decline can be fairly defined. Before many months the price of quicksilver will possibly be as low as 30 cents per pound, at which rate, perhaps, not one concern in the State would make a dollar working with present appliances. Something to cheapen production is even now necessary for the salvation of those establishments treating low grade ores, (and these embrace all the leading mines of the State,) else our quicksilver interests will be practically extinguished, and our market pass into the hands of European smelters. The revolving, cylindrical, oxidizing and subliming furnace is quite sure to smelt at a less cost and work with profit finer and vastly poorer ores than any of the usual furnaces. The large cooled chamber style of condenser must be abandoned, as too costly and wasteful in times of cheap mercury. Similar principles to those herein stated, namely, that of close refrigeration of the hot vapors and then subjecting them to a rotary or spiral and compressing motion till by the aggregation of the globules they become heavy enough to fall through the gaseous current, must be adopted. This lesson from nature should not fall on unwilling or indifferent ears. The laws governing the formation of the drop of rain must be the same as those for the drop of mercury. These principles, the author believes, will soon be acknowledged by all to be true, and their application to be vitally necessary. By the means indicated our quicksilver interests may be strengthened and expanded, and California may defy all competition in its production.

THE tax collected in Eureka county from the proceeds of mines for the quarter ending September 30th, as shown by the report of the county assessor, amounts to $6,720.51. Of this the Richmond company paid $4,885.16; the Eureka Consolidated, $593 80; Atlas, $836.60; Macon City, $195.50. The balance was paid by a number of companies and individuals who had small lots of ore worked during the quarter. The total amount exceeds that of the corresponding quarter for 1875 by $628.81.

Comstock Papers.

No. 9.

The Washoe Argonauts—How they Saved and How they Squandered.

Before proceeding to speak of the early developments made on the Comstock lode and of the first mills and reduction works put up for the treatment of its ores, some further, but brief, remarks may not be out of place concerning the fate and fortunes of the pioneer owners along that lode; a class of persons to whose histories the rare opportunities they enjoyed for acquiring large wealth have imparted an interest that neither their intrinsic merits nor any other incidents connected with their lives could ever have inspired. In other words, it is these fortuitous events rather than the men that awaken curiosity and prompt us to inquire what became of the individuals themselves. We naturally like to know what use men so situated made of their opportunities; suddenly and easily acquired riches producing often very unlike effects upon the human mind, as is exemplified in the story of these Washoe pioneers, some of whom made the most of their good luck, economizing and adding to their gains until they became millionaires, while others (and this was much the largest portion of them), recklessly spending their money as fast as they received it, remained as they had always been, impecunious, shiftless and generally indebted to all who would trust them. A few of them were men of education and refinement, reticent, cautious and thrifty; more, however, were garrulous, imprudent and spendthrift; almost the whole of them being men of generous impulses, free-hearted, and even liberal towards their friends or those whom they happened to like, to a fault.

The first parties who realized any money from the Comstock mines were

The Owners of the Small Rich Claims at Gold Hill,

Where a number of arastras were being profitably run several months before the silver bearing deposit in the Ophir ground was opened or even discovered. These Gold Hill claims, beginning on the north, consisted of the following, applying to them the names by which they were latterly and more generally known: The Triglone, 31¼ feet; the Imperial-Empire, 123 feet; the Bacon, 45 feet; Empire North, 55 feet; Eclipse, 30 feet; Treuch, 20 feet; Empire South, 20 feet; Plato, 10 feet; Bowers, 20 feet; Piute, 20 feet; Consolidated, 51 feet; Rice, 13¼ feet; Imperial South, 65¾ feet; Challenge, 50 feet; Confidence, 130 feet; and the New York and Washoe, 130 feet; the most of these claims being now covered by the ground of the Imperial-Empire company. Small as they were, the majority of them were shared by two or more partners, their extreme richness justifying such subdivision of ownerships. With the transfer of these properties that frequently took place, they often changed names, being sometimes known by one name and sometimes by another.

Among the principal owners in the claims along at first was

Alexander Bowers,

Generally known as Sandy Bowers, owner of the ground that bore his name. Through of Scotch descent he hailed from Missouri, whence he came overland and, tarrying on the Eastern slope, had been following the business of placer mining along Gold canyon for several years, when the notable silver find occurred. He was a rough, honest fellow and well liked by his companions, though not so canny and circumspect in his wordly affairs as his countrymen are commonly reputed to be. He owned originally but 10 feet on the main lode, the additional 10 having been the property of his wife, acquired by her before their marriage. Mrs. Bowers was also of Scotch origin, a hard working, industrious body, who, having repaired to the little hamlet of Gold Hill in the spring of 1859, was there living in a very rude and comfortless sort of abode as late as the month of August of that year. She did the washing for the miners, a business that paid well at that day, there being, as yet, no Chinamen in the country, and had gathered not a little gear prior to her marriage with Sandy.

Bowers' claim proved very rich and he made a great deal of money along at first. Afterwards he built a large mill near his mine, and still later a splendid mansion over in Washoe valley. The mill was not a success, which, with some pecuniary reverses afterwards sustained, reduced his accumulations materially prior to his death, which occurred some 10 or 12 years ago at his residence in Washoe. His widow still lives and is reputed to be endowed with something of that occult power that enables the possessor to foresee future events. In the exercise of this faculty she has frequently prognosticated ore developments on the Comstock, some of which are said to have been verified by subsequent events.

Joseph Plato

Was the owner of the once well known Plato claim, which, although it contained but 10 feet, turned out for some time a large amount of extremely high grade ore, having been even richer than the Bowers ground, which it adjoined on the north. Plato was a man of ex-

traordinary physicel powers, and although not a professional athlete, was much addicted to feats of skill and strength, having, as is apt to be the case with men so constituted, injured himself by over-indulgence in exercises of this kind. He was an early resident of Washoe, and obtained his ground at Gold Hill for a trifling consideration. He was one of the few of those pioneers who not only made money, but possessed the faculty of keeping and employing it to advantage. He died in San Francisco about 10 years ago from general debility, his death having been hastened by a wound caused by the bursting of a gun, while on a visit to Carson valley. His widow, who was left in good circumstances, afterwards married Mr. Howard, now one of the rich men of the city.

John Newman,

Who was part owner in several good claims, one of them situate at Gold Hill, put up the first permanent house erected on the site of Virginia City. This was a stone building and was completed in the month of August, 1859. It afterwards enjoyed the infamous distinction of being the house on which the first and only secession flag ever hoisted in Nevada was run up. This event happened in the spring of 1861, and came well nigh costing the proprietor his life. In this house Newman shortly after killed a man, and, as it was at the time alleged, without any sufficient cause or provocation. As the country was then without courts or law, no notice was taken of the crime. This man was a tailor by trade, but honored the calling by leaving it and betaking himself to less reputable pursuits. He came to San Francisco a few years after the discovery of the Washoe mines, and there married a woman greatly his superior, being a person of some education and pretentions to literary taste. He died soon after, leaving some real estate but not much money behind. Of

Jamas Rodgers

Very little is known. He was quite a young man, was in the country when the silver mines were discovered, and obtained interests in many valuable claims at both Virginia City and Gold Hill. He was also largely interested in the Flowery district, then considered a promising mining locality. Rodgers was noticeable for his quiet and retiring habits, and without being intimate with any, stood well in the estimation of all who knew him. One morning in the summer of 1860, he was found dead in his room in Virginia City, shot through the head by a pistol ball. Whether it was a case of suicide or assassination never was ascertained. The fact that he had no enemies seemed to favor the theory of self destruction, while the still stronger fact that no trace could be found of his money or other effects argued that he had been murdered by parties who had already taken measures for securing his property, knowing that in the loose state of society that prevailed no very searching inquiries would be instituted as to the manner or causes of his untimely taking off. If Rodgers had any friends living the fact never came to light, nor did they probably ever receive any portion of his really valuable estate, this having in some mysterious way been absorbed by strangers.

Thanksgiving Proclamation by Governor Irwin.

State of California, Executive Department: In pursuance of a custom which obtains in most, if not all, of the States of the Union, I hereby appoint Thursday, the 30th day of November, instant, to be observed as a day of thanksgiving and praise. The people of the State are invited to desist from their ordinary vocations on that day, and, assembling in their accustomed places of worship, to give thanks and praise to the Divine Providence for the many blessings bestowed on them, as a community and individuals, during the past year.

We have not suffered from the visitation of famine and pestilence; abundant harvests have rewarded the labors of the husbandman, while general health has blessed the people. General prosperity has visited every part of the State, and caused contentment and happiness among all classes.

We have not been subject to the evils of arbitrary power on the one hand, nor to those of unbridled license on the other. We have enjoyed the inestimable boon of liberty regulated by law. We felicitate ourselves that the cause of education, morality and religion has been advanced.

Our condition, material, social and political, as compared with the condition, in these respects, of most other, even enlightened and Christian peoples, should inspire us with emotions of gratitude, and dispose us to give thanks and praise to the Source of all Good.

Let us, then, on the day set apart for that purpose, recount our obligations to God, and thereby nourish in our hearts those feelings of dependence and sentiments of gratitude which should ever characterize a free, intelligent and religious people.

In testimony whereof, I have set my hand and caused the great seal of the State to be affixed hereto, this, the 14th day of November, A. D., 1876. — William Irwin, Governor; Thomas Beck, Secretary of State.

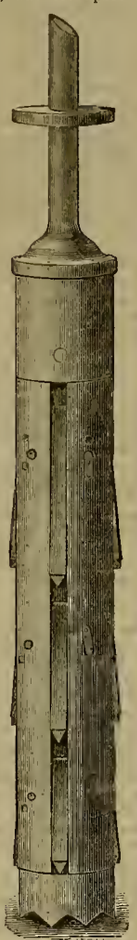
The Justice mining company have found in their south mine a lot of stoped ore averaging $45 per ton. A hundred tons have already been taken out and milled, and it is believed that fully 75 tons more will be taken out of the dump.

Formal Closing of the Centennial.

Last week we closed up the Centennial in these columns, receiving the news by associated press dispatch. The telegraphic report was, however, very tame and very inaccurate, as we learn from the graphic account of affairs which our representative in Philadelphia sends us by mail. He writes as follows:

From beginning to end interest in the exhibition increased. During the last few weeks the every-morning view of people drawing near through the broad avenues leading to the grounds was grand indeed. They poured in incessantly by steamboat, steam and horse cars. For hours each day every conceivable kind of conveyance was hurrying to the front between black ribbon-like lines of people a-foot—walkists of all nations, sorts and sizes, anxious to reach the universal center of attraction on the double-quick.

On Thursday, the last day before the closing ceremonies, over 200,000 people were admitted. Friday, November 10th, last day of the exhibition, was set apart for the "closing ceremonies." A mammoth platform stretching wide across the front of the main building was erected the previous night. In front of this decorated elevation extending back towards machinery hall, were placed thousands of seats for invited guests, still leaving acres of standing room for the patriotic multitude, which under ordinary circumstances would have overrun its borders, like an over-flowing sea, and it really was such a multitude which became disappointed.



Woolhouse's Artesian Well Borer.

The exercises were announced to take place between 2 and 4 P. M. Long before 12 the crowds began to gather around the rope-bound space. The rains also descended and deluged the platform and the vacant seats, but the men and women outside of the ring stood their ground. The numbers with and without umbrellas increased and multiplied. And until nearly three o'clock all were expectant of seeing President Grant with the officers of the day march forth from the judges' hall to perform at least a part of the ceremonies promised. Meanwhile the ceremonies proceeded in the judges' hall, (before the few accommodated within its limited walls,) in the order reported to our readers by wire last week.

Disappointed upon the grounds, many who revered the great exhibition, allured by the statement that President Grant would himself stop the big Corliss engine in machinery hall, took up their position in the nearest proximity attainable to the great motor, and patiently awaited their second disappointment, the valves being finally closed by the engineers, without the least formality observable by the crowd.

Delighted, as at the low murmur of the ocean waves, thousands had approached and hesitated again and again near this ponderous craft-work, ere its busy life so quietly ebbed. Hardly had its power through miles of shafting and a million of cranks gently ceased, when a furious screeching of numberless whistles, humming of blowers, ringing of bells, booming of cannon and acres of general din and clatter incessantly rent the air for a full quarter of an hour.

Ere quiet was restored, a sparse built man, of more than medium hight, rising 50 years of age, affable and venerable looking, appeared upon the platform. It proved to be George H Corliss. He modestly received the loud and repeated applause of the earnest and intelligent multitude that still lingered around the engine.

Packed, jammed and crowded towards the center from its immense periphery, the breaking up of this solid mass of men and women was fraught with great danger. For a few moments the sacrifice of human lives seemed inevitable. All was beyond the control of the mere sprinkling of policemen. Children were trampled on; women, terrified, shrieked for protection. Some were taken off their feet and carried a hundred yards down the main avenue. Two ladies were carried insensible up on the bass platform of the engine, and scores of others helped over the railing for safety, ere quiet was restored.

At half-past four the crowd waiting in front of the main building, reinforced by detachments from machinery hall, were having a jolly time. Men cleverly counterfeiting the president and authorities of the day, were stepping to the front, raising their beavers, bowing, scraping, thumbing their vests with elbows akim, returning thanks, etc. Umbrellas in the rear made dents in the speakers' hats. Hats, regardless of cost, returned compliments right and left to umbrellas, and so the high carnival went on in the best of humor and manners ludicrous enough to have choked even our old forefathers with laughter.

This, as far as it goes, is a true report. Our readers will not likely find it in any other print. It seems a pity that the storm disarranged the original programme. Notwithstanding the "formal" closing, the exhibition is to remain open ten days or more to visitors on the same terms of admission as heretofore. Although many things are being removed, enough remains to invite the attendance of new-comers. A permanent exhibition is being formed of great importance. D.

Bullion Shipments.—Since our last issue shipments from prominent mines have been as follows: California, Nov. 14th, $108,160; Con. Virginia, Nov. 14th, $23,319; Grand Prize, Nov. 14th, $2,378; Modoc, Nov. 12th, $33,800; Northern Belle, Nov. 12th, $18,000; Chollar, Nov. 15th, $9,087.38; Modoc Con., 14th, 200 bars—total to date, $42,000; Leopard, Nov. 12th, $9,216 05; Northern Belle, Nov. 14th, $12,003.06; California, Nov. 18th, $107,108.56—total to date, $459,440.66; Modoc Con., Nov. 15th, 600 bars—total to date, $54,600; Chollar, Nov. 17th, $16.013 01—total to date, $25,100.39; Con. Virginia, 18th, $122,713 10—total to date, $238,800 46; Leopard, Nov. 16th, $4,511.71; Tybo Con., Nov. 12th, $8,551.11—total to date, $17,598.08; Manhattan, Nov. 17th, $12,205 35—total for week, $24,595.04; Leopard, Nov. 20th, $4,300; Modoc, Nov. 18th, 400 bars bullion—total to date, $63,000; Tybo Con., Nov. 16th, $8,765.20—total this month to date, $27,363.28; Ophir, Nov. 21st, 4 bars bullion, value, $16,175.64—total to date, $24,100.84; Manhattan, Nov. 21st, $11,400; Northern Belle; Nov. 19th, $18,001.71; California, Nov. 21st, $112,235.13—total to date, $571,675.79; Modoc, Nov. 20th, 232 bars—total to date, $67,872.

Improved Artesian Well Borer.

Considerable difficulty has heretofore been experienced in boring artesian wells, for the reason that frequently, at the depth of several hundred feet, very hard rock is reached, in which the ordinary form of drill usually employed fails to cut a bore of sufficient size and regularity for the well pipe shoe to pass through. To obviate these and other defects, John A. Woodhouse, of Anaheim, has invented and recently patented through the Mining and Scientific Press patent agency, a drill which by reason of an arrangement of automatically expanding or projecting side drills and chisels and a main center drill below such arrangement of side drills, will insure in every instance a bore of sufficient size and smoothness.

The main center drill of this device, illustrated herewith, is mortised to the lower end of a cylinder in such a manner that while it will be held securely in place during the drilling operation, it may be readily detached therefrom when necessary. This may be accomplished by means of bolts provided with spring catches or locks, conveniently arranged to maintain the tenons securely between their mortises. The mortises in the drill are so formed that passages shall be left therein for the inflax of water and drillings into the cylinder through a valve located in the lower part thereof.

The cylinder is constructed with three series of longitudinal recesses or compartments, each series embracing about ten compartments, at such distances apart that the cutters pivoted therein may thoroughly cut away such rock as may have been left by the main center drill. The side drills are pivoted at or near their upper ends within the said compartments by bolts or pins, or by a rod passing entirely around the cylinder. Said drills are provided with a drill or bit, and also a cutting blade or chisel located higher up on the shank and serving to smooth the walls of the well, which may have been left by the lower drills in a rough condition.

These side drills also rest upon springs which are proportioned in strength to the work to be done, and tend to press the said drills and cutters outwards to the working point during operation, which is practically a vertical and slowly rotating movement of the device. During any movement, however, of the device within the shoe of the well-tube the drills and cutters are compressed and fit snugly within their respective compartments, the springs being usually compressed within a recess formed by cutting away a portion of the lower side of each drill.

The chisels are intended to be made separate from the drills and to be secured thereto by bolts or suitable mechanical means.

A metal disk somewhat less in diameter than the cylinder is secured to the upper end of the same as shown, by short rods or studs, so that an open space shall be left between the two. A screw bolt is fastened in this plate and is the medium through which the drilling device couples with the usual working shaft. The lower end of the working shaft is provided with a guide disk which maintains the drill in a steady central position and couples with the said rod.

When rock or other substance is reached which necessitates the use of this construction of drill it is coupled with the working shaft as described, enclosed within the shoe or lower cylindrical case of the well tube and sunk to the bottom of the well; after this the shoe is raised above the several series of side cutters and the operation of drilling commences. The side drills will be kept wet by water which usually will flow over the top of the cylinder, but in case no water is reached it can be supplied from above.

Centennial Figures.—A dispatch from Philadelphia says: Totals of receipts at the exhibition from all sources, from May 10th to November 10th, may be stated approximately as follows: From admission fees, $3,813,724; from concessions, $290.000; from percentage and royalties, $205.011; grand total, $4,308.735.

The completion of the C. & C. side-track of the railroad now enables the shipping of ore to the Carson river mills. The raising of ore through the C. & O. shaft is an important feature, as it will greatly facilitate the production of a sufficient amount of ore to keep the mills all running during the winter months.

Ward district, Nevada, now has a newspaper, the Ward *Miner*, the first number of which has reached us. It is published by Mark W. Musgrove, and, although small, will grow with the camp. We hope the editor will keep us well posted on the mining news in his locality.

Last month eight vessels carried coal from the coal mines near Seattle to San Francisco, their cargoes aggregating 8,805 tons. Of these eight cargoes, two were shipped by the Renton company and six by the Seattle.

Recent Patents.—Our usual list of recent patents came to hand too late this week for notice.

Mining Appliances.

Several very useful suggestions recently made in connection with mining appliances are worthy of being placed on record, although but one to which I shall refer has been secured by patent, not the least important being that of Messrs. Davis and Fieldhouse, of Tipton, for an apparatus to be used in sinking pits or sumps; it is constructed with a metallic cylinder (varying in diameter and hight according to the nature of the work to be effected,) provided with a movable or detachable bottom, which is connected to the cylinder by hinges or by a central rod (referred to hereinafter), and in which are two valves or doors opening upwards, and near the outside of which four spikes pass through, and are cottered upon the upper surface of the plate, and in the center of which is another spike similarly cottered, and above which latter cotter a beater is attached to prevent the said valves or door opening too wide. On each end of the diameter of the movable bottom is a hinge and clasp, one of which clasps is unfastened when the contents of the cylinder are required to be emptied out; otherwise if a center rod is used passing through the entire length of the cylinder we form the center spike at the bottom of the rod, and at the top of the cylinder we place a horizontal guard, a cotter on the upper surface of which keeps the movable bottom in its place. About 12 inches above this cotter is a movable cap, and when it is required to empty the cylinder the machine or apparatus is drawn up to the surface of the pit or sump, and the said cotter is removed, when the movable bottom will fall the 12 inches, and the contents, sand, gravel, or earth, of the cylinder will escape, and if required, into a specially provided receptacle, or if the said detachable bottom is connected to the cylinder by hinges, as above mentioned, it may be detached by a plug.

Working within the said cylinder is a piston or bucket somewhat similar to an air-pump bucket, which is provided with two valves opening upwards, and which are prevented opening too wide by a bester, and secured by bolts going through and to the under side of the bucket. The bucket is also provided with four eye-pins, underneath which are hinge-holes in which the valves work. The said eye-pins are secured underneath the bucket, in the outer diameter of which are two grooves, in which fit two guides or slides attached to the inner diameter of the cylinder by countersunk rivets or bolts. To the said eye-pins are attached chains which are connected above by a ring or link connected to a steam-engine or any other suitable motive power. Motion is by this means imparted, and the bucket is actuated in the cylinder. Upon being raised, a partial vacuum is formed under it, and the debris is, consequently, sucked through the bottom valves into the cylinder. A continuation of the strokes of the bucket causes the cylinder to become nearly filled, when the whole apparatus is drawn up to the surface and can be emptied by one man, as before described, no one being employed in the pit or sump, so that by the use of this improved apparatus human life is not endangered, and the work required to be done is effected much more economically than if performed by manual labor. Besides this, the apparatus can be used in sinking and cleansing pits and sumps, where, on account of an influx of water or the presence of quicksand, manual labor cannot be employed without risking life. The improved apparatus thus acts as, and after the manner of, a pump for earth instead of water, and it will work any depth under water and bring up the earth.

Another unpatented invention of interest to miners is that of Mr. J. T. Fewkes, of Philadelphia, for an improved miner's pick having a head with sockets for the reception of bits of various kinds, and set screws for holding the same firmly in position. It also relates to a wrench fitted in the handle of the pick, and concealed in the eye thereof, so that it is within convenient reach for tightening the set screws of the head, and is without the danger of being lost or liability to filling with dirt. It also relates to holding the bits and sockets by wedging joints. With the eye portion of the head there are formed the bit sockets, which project in opposite directions therefrom, and on the lower side of said sockets there are bosses in which are fitted set screws. The bit is formed with a wedge-shaped groove, and the inner face of the socket with a wedge-shaped tongue, or vice versa, the location of the parts being such that when the bit is fitted in the socket the tongue will enter the groove, and thus there is formed a wedging joint. In the bases of the sockets there may be placed pieces of soft metal that constitute cushions against which the inner ends of the bits will come in contact. When the said bits are properly located the screws are tightened, and the former are securely held, the cushions preventing fracture to the bases of the sockets and inner ends of the bits.

It will be seen that bits of various kinds may be readily applied to and removed from the head, and the screws form simple and convenient means for securing and releasing the bits. The bosses provide large surfaces for the set screws, so as to strengthen their hold and steady them during rotation. A portion of the upper end of the handle is removed, and in the space thus formed there is fitted and secured a wrench, which is flush with the surface of the handle. When the handle is in position in the eye of the head the wrench is concealed thereby, and does not interfere with the hold of the handle, but when the said set screws are to be tightened or loosened the handle will be readily removed from the head by a few blows, and the wrench immediately presented for service, the handle affording convenient means for operating the wrench and providing long leverage therefor. When the wrench has accomplished its work, or is not required, the handle will be restored to its place in the eye of the head and tightened therein. It will be seen that the jaws of the wrench are covered by the adjacent wall of the eye of the head, whereby dirt will be excluded from said jaws. The wrench cannot fall out and be lost, and the miner, or other operator, has a wrench within convenient reach, thus avoiding the necessity of carrying or having a separate tool.

Some improvements in anemometers, or instruments for measuring the velocity of air or gas, has been suggested by Mr. R. M. Lowne, of East End, Finchley. He forms the blades of the fan of vulcanite, instead of forming them of metal or mica, as has heretofore been the case, by which means he is enabled to produce a durable, cheap and light fan, capable of withstanding the deleterious and corrosive effects of gases and impure air. He also arranges the gearing communicating with the counting apparatus, so that the latter shall be practically sealed off or protected from the entrance of dust, gases or impure air. For this purpose instead of mounting a worm or screw on the axis of the fan of larger diameter than such axis, as heretofore, which necessitates the leaving of an open hole in the case of the counting apparatus, he either forms such worm or screw as small or smaller than such axis; or, preferably, the improvements suggested by Mr. Lowne dispenses with the worm or screw, and in lieu thereof fixes on the axis of the fan a toothed wheel or a pinion, which communicates motion to the counting gear, thereby enabling him to pass the axis of the fan through a hole in the case of the counting gear closely fitting such axis. He also in that class of anemometer known as Byram's anemometer applies thereto a lever mounted on an axis of motion, one end of which lever acts upon suitable mechanism, as will be well understood, so as to readily throw the counting apparatus in or out of gear with the wheel or pinion on the axis of the fan.

The last invention I shall notice is that patented by Mr. P. E. Gegnon, of Paris, which, although rather less directly connected with mining, is not without interest. His invention relates to the manufacture of machine bands, ropes, cables and fabrics for various purposes, composed wholly or partially of brass wire of any suitable gauge, which is first covered with hair or bristles, and then formed into strands, of which a number are twisted together and woven or braided into a fabric, the weft being composed of single strands, and the warp of a number of strands twisted together, or *vice versa*. The rope, cable, or fabric thus obtained is then heated to about 150 degrees Cent. for the purpose of rendering the hair viscous and causing it to adhere to the wire. The same result may also be attained by the application of pressure and a suitable cement without the aid of heat.—*London Mining Journal.*

British Lead Mines.

We have received an early copy of the fifth edition of Mr. Murchison's pamphlet, and the contents fully justify the interest which has been felt in its appearance. The amount of dividends paid by the public companies in the first nine months of 1876 is not only considerably more than that paid by them in the corresponding period of last year, but is even larger than the whole of 1874, and nearly equal to the whole of 1875. Mr. Murchison may well say, "the continued prosperity of British lead mining in the midst of the surrounding and prolonged depression in all other industries is a striking and undeniable fact in its favor, and an additional confirmation of the opinions I have so often expressed for many years, when no one else had the inclination to support my views." People often expect mines to pay—and, indeed, to do so largely—and yet grudge, and often refuse, the moderate capital required to give a fair chance of realizing profits. But, as Mr. Murchison asks, "is there any other industry or business in the country that can be compared to them (lead mines) for permanency, steadiness and the high rate of return, even under the difficulties (as to getting capital) they have had to encounter? What else can show so many instances of continuous satisfactory profits from 50 to 100 years?" Particulars are then given of the capital invested in railways which yield an average return not exceeding three per cent. £35,000,000 laid out on constructed lines paying nothing, while upwards of £9,500,000 pay not exceeding one per cent. Even the leading lines are continually increasing their capital, the result being diminished returns; and the shares have frequent and considerable fluctuations.
